**AMBO** (Lat.), a kind of reading-desk or pulpit, which, in early churches, was placed in the choir. The gospels and epistles were read from the A., and sermons were sometimes preached from it, although the more usual practice in the primitive church was for the preacher to stand on the steps in front of the altar. The A. is still to be found in oriental churches, and specimens of it may be seen in Rome. The A. has two

ascents, one from the e., and the other from the w. In the Roman churches, there were two ambos, one on each side of the choir, from one of which the gospel was read, and from the other, the epistle. Where two such ambos were used, their construction was somewhat different. The name A. was also given to the analogium or reading-desk used in monastic choirs, which was usually in the form of an eagle.

**AMBOISE**, a t. on the left bank of the Loire, in the department of Indre-et-Loire, France. It is 15 m. by railway e. of Tours, and lies in a region so rich in vineyards, that it has been called "the garden of France." Its manufactures are unimportant. A. possesses a castle, in which several of the French kings have resided. Charles VIII. was born here. It was also the scene of his death. The town is memorable as the place in which the religious wars that devastated the kingdom during the 16th c. broke out, and where the word "Huguenot" was first applied to the Protestant party. The castle of A. was much improved by Louis Philippe, and was the residence of the Arab chief, Abd-el-Kader, during his captivity in France. Pop. '76, 4475.

**AMBOISE**, GEORGE D', cardinal and prime minister under Louis XII. of France, was b., 1460, at Chaumont-sur-Loire. When only 14 years old he was made bishop of Montauban, and almoner to Louis XI., and, in 1493, was made archbishop of Rouen. Initiated in early years into the intrigues of court, he soon, by his zealous services, secured the confidence of Louis of Orleans (Louis XII.), by whom he was made premier in 1498. From this time A. became the prime mover in all the political affairs of France. By his advice the king undertook the capture of Milan, which had such great influence on the fortunes of France. After the death of pope Alexander VI., A. endeavored to raise himself to the papal see, and having failed became the dangerous enemy of the succeeding popes, Pius III.—who occupied the papal chair only 27 days—and Julius II. To secure his own election, A. encouraged a schism between the French church and the see of Rome, and convened a separate council, held first at Pisa, afterwards at Milan and Lyon; but his plans were frustrated by the failures of the French army in Italy. He died at Lyon, May 25, 1510. The cardinal A. was a dexterous and experienced statesman; but was accused of avarice, vanity, and ambition, and it was said that his vast fortune of 11,000,000 livres had not been accumulated by over-scrupulous means. His biography was written by Montaigne (1631) and Legendre (Rouen, 1724).

**AMBOY**, a t. in Lee co., Ill., on the Illinois Central, and the Rock Falls branch of the Chicago, Burlington and Quincy railroads, 94 m. w. of Chicago. It has manufactures and local trade. Pop. '80, 3000.

**AMBOYNA**, APON or THAU the most important of the Spice islands belonging to the Dutch, lies s.w. from Ceram, and n.w. from Banda, in 127° 51' 30"—128° 23' 15" e. long., and 3° 26' 40"—3° 49' s. lat. Area, 287 sq. m. The bay of A. runs into the island lengthways, forming two peninsulas, the northern called Hitu, and the southern, which is the smallest, Leitimor. A. is mountainous, the highest peaks being in Hitu. The climate is healthy; average temperature, 82° F.; west, 72°. The e. monsoon brings heavy rains and storms. There are many rapid streams, and the t. of A. is supplied with excellent water from three small rivers. Clove, sago, mango, and cocoa-nut trees are abundant, also fine timber for cabinet work. The sago palm grows along the shores. The hills are covered with the cajeput or leucadendron, from the leaves of which a medicinal oil is extracted. The clove produce varies much, but the average of 10 years is about 400,000 lbs. In a good year, a bearing tree gives about 5 lbs. Sweet potatoes, coffee, pepper, indigo, rice, and fruits are grown. Fish is plentiful, and on the banks of A. beautiful shells are found. Deer are numerous on Hitu. There are hogs and goats, a few sheep, monkeys, civet-cats, anteaters, crocodiles, snakes, etc. Buffaloes, horned cattle, and horses are imported. The natives are for the most civilized, though still very superstitious. They speak a Malay dialect, and observe customs which indicate a Hindoo origin. Daughters are a source of wealth, a payment of jewels, slaves, or clothing being exacted from the bridegroom. The *villagers* are set apart for the clove cultivation, and employed in feudal service during one half of the year. The *freemen* follow handicrafts, grow fruits and vegetables, fish, make fragrant oils, and trade. The trade, which is small, is chiefly carried on by Chinese and Arabs. Pop. 28,000, fully one half being Christians; the remainder, except 2000 heathen, Mohammedans. The Dutch took A. from the Portuguese in 1605.

**AMBOYNA**, the capital, is situated near the middle of the n.w. shore of Leitimor, on the bay of A., in 3° 41' 40" s. lat., and 128° 15' e. long. A wooden pier, where ships lie in 20 fathoms, leads to the t. through fort Victoria, in which are two companies of infantry and half a company of artillery, making a force of 271 men and 23 officers. The t. is built at the base of mount Soya. The streets are wide and clean; many houses are shaded by nutmeg trees. Principal buildings are two Protestant churches, an orphan house, hospital, etc. Europeans live s.w. of the fort in low stone houses. There is a theater, and well-kept markets. The Netherlands missionary society has a training-school for native teachers and ministers, with a printing establishment for lesson-books. The Reformed church has 1800 members, 1300 being natives, with 2 ministers who superintend other churches. Pop. 10,500. Since 1854 A. has been a free port.

**AMBRA'CIA**, or **AMPRACIA**, a city of ancient Epirus, on the e. bank of the river Arachthus, 7 m. from the Ambracian gulf. About 635 B.C. it was colonized by Corinthians, and became a Greek city. Its power increased until, in the time of the Peloponnesian war, it commanded the whole of Amphilochia, including the city of Argos. In 432 B.C. the expelled Argosians drove out the Ambracians and retook their city. The Ambracians made two unsuccessful efforts to recapture Argos, but their power was declining, and in 338 the old city submitted to Philip of Macedon. About 295 B.C. Ambracia was ceded to Pyrrhus of Epirus, who made it his capital and enriched it with works of art. At a later period it came under the power of the Ætolian league, and in the year 189 B.C. it sustained a siege in the war between the Ætolians and the Romans, the latter entering the place and carrying many of the treasures of art to Rome. In 31 B.C. Augustus removed the people of A. to Nicopolis, the town which he founded in honor of his victory at Actium. The site of A. is now occupied by the town of Arta, near which ruins of the old city can be seen.

**AM'BRIZ**, part of the Portuguese Angola, Africa; 89,300 sq.m.; pop. 2,100,000. The chief t. is A. at the mouth of Loge river, in 7° 52' s. The Portuguese annexed the t. in 1855. In 1865 it had 16 trading stations, of which 2 were American.

**AM'BROSE**, **SAINT**, one of the most celebrated of the ancient fathers of the church, was b. about the year 340, probably at Treves, where his father, as prefect of Gaul, was wont to reside. A. received a fortunate omen even in his cradle: a swarm of bees covered the slumbering boy; and the astonished nurse saw that the bees clustered round his mouth, without doing him any harm. His father, perhaps remembering a similar wonder related of Plato, foreboded from this a high destiny for A. He received an excellent education, and went with his brother Satyrus to Milan, in order to follow the legal profession. He soon distinguished himself so much, that, in 369, he was appointed, by Valentinian, prefect of upper Italy and Milan. In this office, his gentleness and wisdom won for him the esteem and love of the people, whose prosperity had been much injured by the troubles caused by Arianism. Accordingly, by both Arians and Catholics, he was unanimously called to be bishop of Milan, in 374. A. long refused to accept this dignity, and even left the city; yet he soon returned, was baptized, as hitherto he had been only a catechumen, and was consecrated eight days afterwards. The anniversary of this event is still celebrated as a fête by the Catholic church. As a bishop, A. won the universal reverence of all, by his mild and gentle, though, towards wickedness of every kind, severe and unbending character. Thus, he repulsed the emperor Theodosius himself even from the door of the church, on account of his having caused the rebellious Thessalonians to be cruelly massacred by Rufinus, excommunicated him, and only restored him to the church after eight months of severe penance. A. d. in 397. The best edition of his works, in which he followed in many things the Greek theological writers, is that published by the Benedictines (2 vols., Paris, 1686-1690). The hymn, *Te Deum Laudamus*, is usually ascribed to A., but it is proved to have been written 100 years later. The Ambrosian ritual has also received his name, only because A. had made some changes upon it, which are retained at the present day in the Milanese church. A commentary on the epistles of Paul, which was formerly ascribed to A., was probably composed by the Roman deacon Hilarius, and is usually quoted as the commentary of the Ambrosiaster. A. is the patron saint of Milan, and the Ambrosian library received its name in honor of him.

**AMBRO'SIA**, in Greek and Roman mythology, is the name of the food of the gods, which conferred immortal youth and beauty. It was brought by doves to Jupiter, and was occasionally bestowed upon such human beings as were the peculiar favorites of the gods. A. was also used as a fragrant salve, which the goddesses employed to heighten their beauty; with which Jupiter himself anointed his locks; and which had the property of preserving bodies from corruption. Hindu mythology has also its *amrita* (from *a*, signifying "without" or "not," and the Sanscrit root, allied to the Lat. *mort*, and Greek *brot*), or liquor of immortality, that resulted from the churning of the ocean by the gods; and the gods of the Scandinavian pantheon were preserved in perpetual vigor by eating the apples guarded by Idun.

**AMBRO'SIAN CHANT**, the choral music of the early Christian church, introduced from the eastern church into the western by St. Ambrose, bishop of Milan, in the 4th c.; it was founded on the first four authentic modes of the ancient Greeks, and was sung antiphonally. It continued in use until the 6th c., when pope Gregory the great reformed the music of the church by introducing the Gregorian chant. There exists still another specimen of music by Ambrosius, which is now known only in the German-Lutheran church by Luther's translation of the words, *Nun kommt der Heiden Heiland*; it is beyond a doubt 1400 years old, and remains to this day a beautiful specimen of melody, expressive of filial humility and submission. The A. C. continued to be still sung in the cathedral at Milan long after Gregory's reformation, and till this day, it is said, it may be heard there.

**AMBRO'SIAN LIBRARY**, a library in Milan, so named in honor of St. Ambrose, the patron saint of that city. It was established in 1609 by the cardinal archbishop Federigo Borromeo, who employed learned men to collect books both in Europe and Asia. This.

library was afterwards enriched by the acquisition of the MSS. of the Pinelli collection. Borromeo intended to establish, in connection with the library, a college of 16 learned men, each having charge of a particular department, to make known the works in the library, and assist strangers in their researches. The want of funds limited the number of members of this college. The chief acting officer, or *prefetto*, and four assistants, are Doctores Bibliothecæ Ambrosianæ. The library contains 40,000 volumes of printed books, and 8000 MSS. Among the many rarities belonging to it, besides the Palimpsests and other as yet unedited MSS. discovered by Maio, Castiglione, and Maz-zuchelli, it contains a "Virgil," in which Petrarch had written an account of his first meeting with Laura.

**AMBRY, AUMERY, or ALMERY** (supposed by some to be a corruption of Almonry), a niche in the wall of a church, shut in by a door; or a small cabinet of wood placed by the side of the altar, for the purpose of holding the vestments and utensils, such as the chalices, basins, cruets, etc., used for the service of the mass. In monastic buildings, ambries were used for various purposes, such as keeping plate, hanging towels for the monks to dry their hands with before dinner, and the like. In this sense, the term A. seems to have been applied to any kind of cupboard which was closed in and locked, and it is so used in Scotland at the present day.

AMBULACRA OF STAR-FISH.

As seen in a longitudinal and vertical section of one of the rays; and three of them in a separate figure on a larger scale, in which they are shown in different conditions: *a, a, a*, tubular feet; *b, b, b*, internal vesicles; *c*, the organ which supplies the fluid with which they are filled.

**AMBULA'CRA** (from the Latin *ambulare*, to walk), the name given to peculiar organs of locomotion with which star-fishes and other *echinodermata* are furnished. They are fleshy, more or less elongated, and terminated by suckers. They pass through orifices in the shell or other external integument of the animal, and are generally arranged in rows. Those of the *echini*, or sea-urchins, are long enough to extend beyond the point of the spines, and by means of them the animal is able to climb a perpendicular rock. They are tubular, and each has at its base a vesicle, filled with a fluid which, on the contraction of the vesicle, is forced into the tube, dilating it to its full extent, whilst, on the contraction of the tube, the fluid returns again into the vesicle. The fluid is not secreted by these vesicles, but provided for them by distinct secreting organs.

**AM'BULANCE**, a military term which is somewhat differently applied in different countries. In France, an A. is a portable hospital, one of which is attached to every division of an army in the field, and provided with all the requisites for the medical succor of sick and wounded troops. Such an A. is stationed at some spot removed from immediate danger; and soldiers are sedulously employed after a battle in seeking out those who have fallen, and conveying them to the A. Baron Larrey, during the great wars of the first Napoleon, brought this department of medical business to a high degree of efficiency, and set an example to the rest of Europe. When England engaged in war with Russia in 1854, the A. arrangements, like many others relating to the army, were in a very imperfect state. In the English army, A., strictly speaking, means a field hospital with all its wagons, litters, tents, cooking canteen, etc.; but, sometimes the name is applied to a four-wheeled wagon or a two-wheeled cart fitted up for the reception of wounded men. When Lord Raglan was about to be sent out with the army, Dr. Guthrie, president of the college of surgeons, devised a new form of A. cart; while Dr. Andrew Smith, director-general of the army and ordnance medical department, invented a new A. wagon. Annexed is a figure of Dr. Guthrie's A. cart. The badly wounded were laid on it at full length, while those slightly hurt sat in front and rear, and on the sides. A stretcher is slung from the top for the accommodation of the former. The back-board is let down for cases requiring amputation. The hospital chests are lashed underneath. Many of Smith's A. wagons and of Guthrie's A. carts were at once made and sent out to the *c.*; but they were not at the proper place when most wanted. After the battle of the Alma, the English were almost entirely destitute of means for conveying their wounded down to the beach; but the French had for this purpose a large number of *cacolets*, suggested to them by their experience in Algeria. Each of these consists of two easy-chairs, slung in panniers across the back of a mule; and it is accordingly available along tracks where no wheel-carriage could pass. These *cacolets* have since been adopted in the English army, as well as improved hand-litters, wheeled-litters or barrows, and ambulance wagons on a more modern model than those of Smith and Guthrie, but having the same general character. The American war, the wars of 1866 and '70, and above all, the growth of volunteer aid societies under the influence of the Geneva convention of 1866 (which gave to the wounded and their attendants the privileges of neutrality), have

largely developed the A. equipments of every European army. Every international exhibition now contains an immense number of designs for the safe transport of the wounded. The most remarkable step taken in this direction has been the organization of railway ambulances. Trains of carriages either built for the purpose, or adapted from the ordinary rolling-stock, can now be fitted up as moving hospitals, with their staff of surgeons and attendants; and by means of these railway ambulances the wounded can be safely and rapidly removed from the incumbered field hospitals to the permanent hospitals of the great cities of their own country. All the fittings for thus adapting railway trains to hospital purposes are now kept permanently in store in many of the countries of the continent.

**AMBULATORY.** A name occasionally given in architecture to the cloisters of a cathedral, college, or the like.

**AMBUSCADE** is one of the manœuvres adopted in war. The original Italian, *imboscata* ('concealed in a wood'), denotes the general nature of the A.; but the meaning is now much more extended, seeing that it implies to any attempt to attack an enemy by lying in wait and coming upon him unexpectedly. In former days, when soldiers fought hand to hand more frequently than at present, the A. was much resorted to; but the tactics of modern times render it less available. It was by an A. on the part of the revolted sepoys that so many British soldiers were killed and wounded in that adventure which was known, during the wars of the Indian mutiny, as the 'disaster at Arrah,' in July, 1857. An A. is neither an 'attack' nor a 'surprise,' in military language; it is something more sudden and unexpected than either.—**AMBUSH** is another name for ambuscade.

**AMELANCHIER**, a genus of plants of the natural order *Rosaceæ* (q. v.), sub-order *Pomeæ*, distinguished by having five ovaries, each of which is divided into two cells, with one ovule in each cell, the ripe fruit including 3 to 5 carpels. It consists of a few species of small trees with deciduous simple leaves, abundant racemes of white flowers, and small fruit of the size of a pea, or a little larger, but soft, juicy, and agreeable. The common A. (*A. vulgaris*) is a native of the Alps, Pyrenees, etc. The other species are natives of N. America. *A. botryapium* is sometimes called June-berry, from its fruit ripening in June, before that of any other tree or shrub; and *A. ovalis* produces a very pleasant fruit, which makes excellent puddings. The amelanchiers are planted in Britain merely as ornamental trees. They are very hardy.

**AMELIA**, a co. in central Virginia on the Danville railroad, almost surrounded by the Appomattox river; 800 sq. m.; pop. '70, 9878—6823 colored. It is intersected by the Richmond and Danville railroad; the productions are wheat, corn, oats, and tobacco. Co. seat, Amelia Court House.

**AMELIA** (anc. *Ameria*), a t. of central Italy, in the province of Perugia, 21 m. s. w. of Spoleto. It is picturesquely situated on the mountains between the Nera and the Tiber, about 7 m. from the junction of the two rivers. It is the seat of a bishop, and has a cathedral. Pop. of commune, 7024.

**AMELOT DE LA HOUSSAYE**, ABRAHAM NICOLAS, 1634–1706; a French historian; a prisoner in the bastille by order of Louis XIV. He published *History of the Government of Venice*, translations of Macchiavelli's *Prince*, and Tacitus's *Annals*, and of Sarpi's *History of the Council of Trent*, the notes of which, written by A., gave great offense to the advocates of the unlimited authority of the pope. Voltaire speaks of his histories as very good, and of his memoirs as very faulty.

**AMELOTTE**, DENIS, 1606–78; a French ecclesiastic and writer; member of the congregation of the orators of St. Philip Neri. He is remembered for his quarrels with the Port Royalists, and his fierce denunciation of the Jansenists. A. published a translation of the New Testament in 1666–68.

**AMEN**, a Hebrew word of asseveration, is equivocal to "yea," "truly," and has been commonly adopted in the forms of Christian worship. In Jewish synagogues, the A. is pronounced by the congregation at the conclusion of the benediction given at parting. Among the early Christians, the prayer offered by the presbyter was concluded by the word A., uttered by the congregation. Mention is made of the practice in the 1st epistle to the Corinthians (xiv. 16). Justin Martyr is the earliest of the fathers who alludes to the use of the response. "In speaking of the sacrament, he says that at the close of the benediction and prayer, all the assembly respond 'A.' According to Tertullian, none but the faithful were allowed to join in the response." A somewhat noisy and irreverent practice prevailed in the celebration of the Lord's supper until the 6th c., after which it was discontinued. "Upon the reception both of the bread and of the wine, each person uttered a loud 'A.,' and at the close of the consecration by the priest, all joined in shouting a loud 'A.'" The same custom was observed at baptism, where the sponsors and witnesses responded vehemently. In the Greek church, the A. was pronounced after the name of each person of the Trinity; and at the close of the baptismal formula, the people responded. At the conclusion of prayer, it signifies (according to the English church catechism) *so be it*; after the repetition of the creed, *so is it*.

**AMENDMENT** is a term used both in judicial and parliamentary proceedings. In the former, it is a power of correction of any errors in actions, suits, or prosecutions, which has been greatly extended of late, and which has largely improved and simplified the administration of the law, both in England and in Scotland. In parliament, the word A. is used when it is intended to oppose, vary, or qualify a question or resolution; and in the case of bills, it is employed as a courteous method of dismissing the bill from any further consideration, by moving that instead of "now," it be read at the end of three months, six months, or any other term beyond the probable duration of the session. It is also competent to a member to move as an A. to the question a resolution declaratory of some principle adverse to that of the bill, provided it be strictly relevant, as was done successfully, in 1859, by Lord John Russell, when he moved and carried, as an A. to the motion for the second reading of the reform bill of Lord Derby's government, a resolution declaratory of a principle which the supporters of that measure considered to be subversive of it.

**AMENDMENT** (*ante*). An A. to the constitution of the United States may be proposed by the affirmative vote of two thirds of each house of congress, and then it must be submitted to the states, when, if three fourths of all the states by vote in the legislature (or in state convention if required by congress) ratify such amendment, it becomes a part of the constitution. Or, on the application of the legislatures of two-thirds of the several states, congress shall call a convention for proposing amendments; but this mode has never been resorted to. There is one restriction only on the nature of amendments, which is "that no state without its consent shall be deprived of its equal suffrage in the senate."

**AMENO'PHIS**, **AM'UNOPH**, or **AMEN-HOTEP**, the name of three Egyptian kings of the 18th dynasty. A. I. was the second of them. He continued the conquests begun by his predecessor in Canaan, and made an expedition towards Ethiopia to extend the boundary of his kingdom. He reigned 21 years, 1499-78 B.C.

**AMENO'PHIS II.**, King of Egypt, son and successor of Thotmes III., and father of Thotmes IV.; identified by some writers with Memnon, who fought against the Greeks at Troy.

**AMENO'PHIS III.**, King of Egypt, son of Thotmes IV. He reigned 36 years, 1400-1364 B.C., and made Egypt prosperous and contented, extending the kingdom over more territory than ever before or afterwards, as it reached from the w. bank of the Euphrates into Ethiopia. There are many monuments of his period, the most famous being the two colossi, one of which is known as "the vocal Memnon." Some writers supposed this to be the king whom the Greeks called Memnon. His exploits in war are commemorated on the obelisk which, transported from Egypt, now stands in the Place de la Concorde, in Paris.

**AMENTACEÆ**, according to some botanists, a natural order of dicotyledonous or exogenous plants, consisting entirely of trees and shrubs whose flowers are unisexual, the male flowers, and very often also the female flowers, disposed in *amenta* or CATKINS (q.v.), and the perianth either wanting or incomplete. This order, which contains many well-known and important trees, is divided into a number of sub-orders, which by many have been erected into distinct orders, forming the *amental alliance* of Lindley. Under A. are ranked *salicinæ* or *salicaceæ* (see WILLOW), *myricæ* (see CANDLEBERRY MYRTLE), *casuarinacæ* (see CASUARINA), *betulacæ* (see BIRCH), *alingiaceæ*, called also *balsamaceæ*, but not to be confounded with *balsaminaceæ*, or *balsamineæ* (see LIQUIDAMBAR); by some also *corylaceæ* or *cupulifereæ* (q.v.), and *platanæ* (see PLANE), both of which Lindley excludes from his *amental alliance*, associating the former with *juglandaceæ* (see WALNUT), as a distinct *alliance*, and referring the latter to the *urtical alliance*. See URTICACEÆ. On the other hand, he unites with the *amental alliance* the order *elaagnaceæ*. See ELEAGNUS.

**AMEN THES**, an Egyptian mythological word equivalent in meaning to the Greek word *hades*, the unseen world. Plutarch explained it as signifying "the giving and taking," an interpretation generally adopted, but erroneously. A. literally means "the hiding" (-place understood). On Egyptian monuments we find the god Anubis leading to A. the souls which, in the form of birds, are escaping from the body through the mouth. He conducts them before the throne of Osiris, who sits as judge, with a council or jury of forty-two persons. The female deity, AMENT, represented on monuments in upper Egypt, is merely a female form of Ammon, and her name has no connection with that of A.

**AMERBACH**, JOHANN, d. about 1520; a German printer, educated in Paris. He established a press at Basel, publishing the works of St. Ambrose and St. Augustine, and began to publish those of Jerome. He was one of the first to use Roman in place of Gothic letters. His son Boniface was an intimate friend of Erasmus.

**AMERICA**, one of the four quarters of the globe; being smaller than Asia, but larger, perhaps, than both Europe and Africa taken together. It is the only one of the four main divisions of the land that is washed by all the four great oceans—the Northern, the Atlantic, the Southern, and the Pacific.

If Terra del Fuego and Greenland are included—as ought to be done on geological grounds—A. occupies about  $150^{\circ}$  of long., and about  $135^{\circ}$  of lat. Speaking generally, its extreme length may be said to be on a meridian, and its extreme breadth on a parallel—facts which, in the light of analogy, look more like a law than an accident. As the map will show, similar coincidences occur in South A. by itself; in Africa, in Europe, in Asia, and in Australia. As between Asia and A., moreover, it deserves to be noticed that the meridional semicircles, along which run their respective lengths, form, with an interval of  $180^{\circ}$ , one and the same meridional circle.

Like the old continent, A. has been divided by nature into two peninsulas—Darien and Suez being the isthmuses, while South A. corresponds with Africa, and North A. with Asia and Europe. Even to this extent, however, the resemblance is by no means close. In the new world, the whole of the lower peninsula is to the s. of the whole of the upper one, while Asia overlaps half the latitude, and more than half the magnitude, of Africa.

Of the northern half of A., the southern section, on account of essential differences in character and appearance, is in general contemplated by itself under the name of Central A.—the most convenient limit, perhaps, being a line drawn from the mouth of Rio Bravo del Norte to the lower end of peninsular California; and this line, besides its geographical propriety on both coasts, has the recommendation of marking, on the nearer coast, the international boundary of the United States and Mexico. *Central A.*, it is to be observed, has a political signification as well as a physical one, comprising, in the former sense, the comparatively small states between Mexico and New Granada—Guatemala, Honduras, San Salvador, Costa Rica, and Nicaragua.

Physically, however, these three subdivisions of A. may be regarded as one, being knit together on the w. side by a backbone, as it were, of mountains, which, under various names and various aspects, stretches from the extreme s. at cape Horn to nearly the extreme n. at the mouth of the Mackenzie. To this mountain-system we shall have occasion to refer under the distinct heads of ANDES, CORDILLERAS OF CENTRAL A., and ROCKY MOUNTAINS, restricting ourselves at present, in accordance with the general aim of this article, to such features of the entire chain as may incidentally come under our notice in connection with earthquakes, volcanoes, climate, or hydrography; and with regard to this article generally, the subject being A. as a whole, we shall, as seldom and as little as possible, anticipate details, which, even if anticipated here, must still be repeated under the respective heads of their proper localities.

In thus treating of A., we shall consider separately its *earthquakes and volcanoes*, its *climate*, its *hydrography*, its *history*—comprehending its *discovery* and its *colonization*, but excluding anything like the annals of any individual state—and, lastly, its *geology*, *botany*, and *zoology*.

The *earthquakes and volcanoes* of A. are to be found chiefly in the backbone of mountains already mentioned. In South A. they may be said to be exclusively so found, being confined to the Andes proper, that skirt the Pacific, and to the Venezuelan spur or branch of the main range. The same remark may be applied to Central A. But in North A., the energy which produces both classes of phenomena appears to have followed rather the coast than the continuous chain which diverges gradually from it—earthquakes being often felt in the maritime towns of upper California, and volcanoes having left their traces behind them on the islands of Alaska. The agency in question seems to have traveled from n. to s. along the coast, having exhausted itself in its more ancient seats; and this view derives support from the obvious formation of the Sandwich Islands, which are as nearly as possible parallel with the w. coast of A., between Behring's strait and the equator. On this interesting subject we quote from Sir George Simpson's *Overland Journey*: "The whole group appears to have been thrown up from the deep by volcanic action advancing from the n.w. to the s.e., and increasing in force as it advanced; so that, while island rose after island, each grew at once in height and in breadth according to the intensity of the power that heaved it upwards from the waters. Thus Bird island, a barren rock taking its name from its only inhabitants, must be considered as the germ of the archipelago, as the first fruits of a submarine energy that was here only kindling its fires; while the other links in the chain, Kauai, Woahoo, Mowee, and Hawaii, not only differ, as I have just mentioned, at once in extent and in elevation, but also present, as they proceed, less and less evidence of antiquity in their gradually diminishing proportions of land capable of cultivation—a proof the more conclusive, inasmuch as the soil of the whole group undeniably consists of the successive gifts of years and ages and centuries. Moreover, the visible laboratories of the subterranean fire, which are scattered over the archipelago, confirm the same view; the craters are all extinct, excepting on Hawaii; and even on Hawaii, Mouna Loa, the most south-easterly of its three great safety-valves, alone bears living testimony to the creative impulse that has called the whole chain into existence, and bears it, too, only through its lateral volcano of Kilauea, which, besides itself looking to the east, appears, by the gradual advance of subsidiary outlets down its eastern declivities, to be rolling the hidden sources of its strength—peradventure there to forge fresh islands—under the bed of the ocean."

*Climate*.—In comparing A. with the older continent, we must contrast not e. and w. with each other, but w. with w., and e. with e.—neither Newfoundland with England,

nor British Columbia with Kamtchatka, but Kamtchatka with Newfoundland, and England with British Columbia. Such a comparison shows that the difference lies not, as is often assumed, between the two continents, but between the opposite shores of either continent within itself. For instance, at Nain, in Labrador, the mean temperature is 7° F. below freezing; while at Sitka, in Alaska, it is 12° above freezing. This difference of 19° between the e. and w. coasts of the new world, is only a very little less than the difference between the e. coast of the new, and the w. coast of the old; for the temperature of Gottenburg, in Sweden, is only 21° higher than that of Nain. It is to be remarked, however, that this difference between the opposite coasts of the two continents diminishes as we proceed southwards. New York is only 7° colder than Naples; and Florida has the same temperature as Cairo.

In illustration of the contrast between the e. and w. coasts of A., we are told by the traveler already cited, that, at the mouth of the Columbia river, the first half of Dec. presented one deluge of rain after another from the s.e., this weather winding up on the 16th of the month with a storm of thunder and lightning; "while, to mark the difference of climate between the two sides of the continent, the good folks of Montreal, though occupying a lower parallel than ourselves, were sleighing it merrily through the clearest and driest of atmospheres." Nor is the difference, according to the same authority, less palpable in the old continent than in the new. "To place in the most striking light the contrast in point of climate between the opposite shores of the old continent, Kamtchatka and the British isles may be said, with sufficient accuracy for this purpose, to lie in the same latitudes, and to present the same area, and even to occupy the same position with respect to the proximity of water; and yet, while the British isles, with but little foreign aid, feed at least 25,000,000 inhabitants, Kamtchatka, with the help of extraneous supplies, can barely prevent its population of 4000 souls from starving."

But whatever influences may be common to the climates of both continents, the climate of A. is subject to two peculiar influences—that continent's prolongation southward, and its backbone of mountains. With respect to the former point, A. advances at least 20° further southward than Africa—fully more than half the interval between the latter and antarctic ice; so that the southern breezes which, in summer, bring freshness and delight to the cape of Good Hope, waft cold and misery to cape Horn. Two of Cook's people, on his first voyage, were frozen to death in Tierra del Fuego towards the end of Jan.—in a month corresponding with our July, and in a latitude the same as that of Edinburgh. The backbone of mountains, again, that other point which peculiarly influences the climate of A., does its work in two ways. Throughout almost its entire course, its height arrests the passage of the clouds and rains. Within and about the tropics, these are borne from the e. by the trades; in the more temperate regions, they are brought from the w. by the prevailing counter-currents of air. But in either case, the windward slope of the mountain barrier is a fertile garden, the leeward slope a barren desert. In the more central plateaus, again, of Quito and Mexico, the various terraces present as many climates, and bring together, under the same parallel, all the temperatures and energies of nature.

But there exist, more particularly in North A., peculiarities of climate, which cannot, perhaps, be referred to any known cause. On the opposite sides, for instance, of the great water-shed between the gulf of Mexico and Hudson's bay, antagonistic results are said to show themselves in winter. On the northern side, the climate is understood to improve as one advances westward, the Saskatchewan, though in a considerably higher latitude, opening earlier in spring than the St. Lawrence; whereas, on the southern side, ice forms in New Orleans, at the mouth of the Mississippi, strong enough to bear half-grown boys, a thing wholly unprecedented on the corresponding parallel of the Atlantic shore. Even in summer, at least on the northern side of the water-shed in question, something of a similar change of climate has been observed for maize, which, in Quebec, is a precarious crop, even on the international line of 45°, regularly ripens, in Red river settlement, which, besides 5° more of latitude, is at least 1000 feet higher above the level of the sea.

With respect to that portion of A. which is best known, a popular misapprehension generally prevails as to the steadiness of its climate in any given season of the year. The Canadian summer, for instance, is supposed to be an unbroken period of tropical heat; and the Canadian winter to be, in its turn, an unbroken period of hyperborean cold. Now, in both directions, this is a great mistake. The summer of British A. is often tropical, and its winter often hyperborean, the extreme ranges of the thermometer, according to the experience of credible informants in localities to the s. of London, sometimes being in one and the same year, 104° F. above zero, and 52° below it. But this difference of 156°, which is measured probably by an interval of six months, is far less remarkable than the differences which a few days may bring forth. The highest range occurred within four days after parlor-fires had been given up; and the lowest fell on a day which, a year or so before, had been marked by a powerful thaw. In the city of Montreal itself, 36 hours, or less, have sometimes exhibited a difference, up or down, of 60° F. in winter; and even in summer, whether in Quebec or in the north-west one can seldom reckon on any other month than July as free from night-frosts. In this respect, the Canadian climate may be taken as a sample of the climate of North A. in general.

extreme ranges of temperatures as prevailing respectively in summer and winter, being naturally attended by more or less considerable vicissitudes in each individual season.

In the tropical regions, however, of A., whether central or southern, a singular uniformity of temperature does exist on each of the various terraces of the mountain chain. The same parallel, as has been already mentioned, presents at once the torrid, the temperate, and the frigid zones. Such a view of the matter, however, is, to a certain extent, deceptive, for in not one of the three cases are the vicissitudes of the respective zones, properly so called, found to show themselves. Each level is said to be so steady in its temperature as to enfeeble and enervate the inhabitants through the monotony even of that which is in itself good; and in such cases, the salutary prescription is to ascend or to descend, for a time, from one terrace to another.

*Hydrography.*—With the backbone of mountains as the principal water-shed of A., the rivers on opposite sides of the continent are still more different than the climates. Excepting in Central A., the difference in question is enormous. Even in North A., where it is less than in South A., the contrast is sufficiently striking. On the w. side of the Rocky mountains, the only streams worthy of notice in such a summary as this are the Colorado, which flows into the head of the gulf of California; the Sacramento, which enters the harbor of San Francisco; and the Columbia, which empties itself into the open ocean—three rivers which, if compared with the waters of the opposite coast, are, in practical value, inferior singly to the Hudson, and collectively to the Rio Bravo del Norte. On the e. side, however, there exist rivers to which the Rio Bravo del Norte and the Hudson are but as brooks. To begin with the extreme n.: the Mackenzie, besides draining a large basin on its own side of the Rocky mountains, draws from beyond them two of its principal feeders, the Peace and the Liarde, burying itself, however, under the perennial ices of the Arctic ocean. Passing, without further notice, the Coppermine and the Fish river, of both which the interest is purely historical in connection with arctic discovery, we come to the Nelson, which brings down to Hudson's bay the Winnipeg and the Red river, two streams bordering respectively on the head-waters of the St. Lawrence and the Mississippi, and also the two branches of the Saskatchewan, which all but touch the sources of the Columbia and the Missouri. Next in order is that long alternation of mighty river and mightier lake—that reservoir of half the life-blood of the earth—which, under the name of the St. Lawrence, gradually becomes a sea. South of the St. Lawrence, along the coast, we meet the Atlantic streams of New Brunswick and the United States, all of them valuable beyond their magnitude, and most of them connected, more or less closely, with the Alleghanies—the St. John, the Penobscot, the Connecticut, the Hudson, the Delaware, the Susquehanna, and the Potomac. Round into the gulf of Mexico, and we reach, besides many second-rate rivers in either direction, perchance the most important stream on the face of the globe—a stream which, after uniting the Mississippi and the Missouri under the name of the former, receives on the right the Arkansas and the Red river, and on the left the Ohio, enriched, as it is, with the tributaries of the Wabash and the Tennessee.

In South A., again, the difference between east and west is still more remarkable. On the w. the Guayaquil, the only stream worth mentioning, is not to be compared even with the rivers that flow from the subordinate ranges of Brazil or Guiana; while, on the e., the Andes send down, besides the Magdalena flowing into the Caribbean sea, the Orinoco, the Amazon, and the Plata, into the open ocean across the almost entire breadth of the continent—three networks of inland navigation, which, under the head of the Amazon (q.v.), we have already shown to be virtually one, and, beyond that, to be virtually linked with the Essequibo of British Guiana.

Nor will the disparity between the two coasts of the continent be less striking if the harbors are considered as well as rivers, the external outlets as well as internal channels. On the Pacific, South A. possesses, to the n. of Chili, only two ports entitled to the name, Panama and the Guayaquil already mentioned; while, on the same coast, North A., along a line of 3000 m. up to British Columbia, presents only five safe and convenient havens—Acapulco, Mazatlan, Magdalena bay, San Diego, and San Francisco. But the Atlantic side presents a contrast to which no language can do justice. To take the divisions as they come: Newfoundland has its St. John's, Cape Breton its Louisbourg, Nova Scotia its Halifax, New Brunswick its St. Andrews, Maine its Portland, New Hampshire its Portsmouth, Massachusetts its Boston, Connecticut its New Haven, Rhode Island its Newport, and so on. Nor is this all. While fully a third part of the rivers of Europe and Asia are lost to the commerce of the world at large in the frozen seas of the north, or in such landlocked pools as the Aral and the Caspian, all the considerable rivers of A., with the Mackenzie as the only exception, are, more or less, channels of communication between the open ocean and the interior. To take the three grandest examples—the Amazon, with a basin estimated to contain 1,500,000 sq.m., is navigable for steam-vessels up every one of its main branches, nearly to the eastern foot of the Andes; thus comprising several available lines of 2500 m. each, and presenting, as a whole, a network of such lines to the amount of at least ten times that length. The Mississippi, again, navigable as it is at once to the Alleghanies and to the Rocky mountains, and between them, more to the n., as far as the falls of St. Anthony, has been computed to afford to the steam-vessel an uninterrupted career of 36,000 miles. But perhaps the St. Lawrence, if less extensive, is more marvellous still. Owing to British

improvements of its channel, New York and Pennsylvania have virtually a seaboard on their inland shores; while Ohio, Indiana, and Illinois, accessible to ships from the gulf of St. Lawrence by the lakes, and from the gulf of Mexico by the Mississippi, far eclipse, in the heart of a continent, the peculiar boast of ancient Corinth as the mart of two seas.

To append a few subordinate examples: nearly all the considerable rivers along the coast between the St. Lawrence and the Mississippi possess far more than an average value, in proportion to their lengths, as arteries of internal communication. The Atlantic slope of the Alleghanies, in particular, presents, as a whole, perhaps twice as many facilities in this way as any other region of equal extent on the face of the earth—facilities, too, which have been not less zealously and successfully improved than those of the St. Lawrence. The Hudson has been, at vast expense, and with indomitable energy, connected with the basin of the St. Lawrence at three points—on lake Erie, on lake Ontario, and on lake Champlain; and the Susquehanna has been in like manner connected with the basin of the Mississippi by a canal which terminates at Pittsburg on the Ohio.

But in one part of A., still smaller streams than these last are entitled to particular attention. We allude to those streams, five in number, which promise to vie with each other in connecting together the Pacific and the Atlantic oceans.

The five rivers in question form parts of three different routes. The Atrato of the Atlantic side co-operates with the San Juan of the opposite coast a little below the isthmus of Darien; the San Juan of the Caribbean sea, with the lake of Nicaragua, and with the smaller lake of Leon more to the westward; and, lastly, the Coatzacoalcos of the gulf of Mexico, with the Tehuantepec of the bay of its own name.

To begin with the *first* route: the Atrato and the San Juan flow, in contrary directions, through the slightly undulating country into which the Andes gradually subside as they approach the isthmus. Their head-waters are said to be near to each other, the Atrato being already navigable for small vessels, and the San Juan, manifestly a considerable stream, entering the sea by several mouths, after a course of 150 miles. With such streams separated by such a country, a ship-channel between the two oceans does not by any means appear to be impracticable. Next, as to the *second* route, which, as well as the third, is already in actual use as a place of transit: the San Juan itself, about 100 m. long, has a gentle current, which, though in some places impeded by short rapids, is stated to be always navigable throughout for boats of 10 tons, and for much larger vessels to a considerable distance from the sea. Lake Nicaragua, again, said to measure 140 m. by 40, is adapted for ships of any burden, being 15 fathoms deep. At its w. end it receives the Tipitapa from lake Leon, which, with a length of 35 m. and a breadth of 15, is only 28 ft. higher than itself, or 156 above the level of the Pacific. Two schemes seem to be agitated with respect to the more westerly portion of the route—one scheme proposing to avail itself of lake Leon, and the other to carry the ship-canal at once from lake Nicaragua. Lastly, as to the *third* route, where the intervening land, actually designated as an isthmus, is only 130 m. wide: the Coatzacoalcos alone is said to traverse nearly the entire breadth; while the Tehuantepec, which gives name to the isthmus, goes far to complete what the other has begun.

The practical value of the enterprise of connecting by navigation the Pacific and Atlantic oceans is already evidenced by the fact, that, in the face of the competition of the last two routes, the Panama railroad is perhaps the most profitable undertaking of the kind in the new world. In fact, the completion of any one of these three routes for sea-going ships, would be to realize Columbus's idea of a western passage to the east.

Of the *lakes* of A. a brief notice will be sufficient. In North A., besides the vast reservoirs of the St. Lawrence, a line drawn n. w. from the center of lake Superior appears, on the face of the map, to intersect a kindred series—lake Winipeg, lake Athabasca, Great Slave lake, and Great Bear lake—the first of the four being connected with the Nelson, and the remaining three with the Mackenzie. It may not be out of place to observe, that the general direction indicated is pretty nearly parallel with the Pacific coast, just as the general direction of the St. Lawrence from the great bend at the head of lake Erie is pretty nearly parallel with the Atlantic shores. As to the secondary lakes of n. w. A., their name is legion, almost every stream, whether large or small, expanding itself here and there vastly beyond its average width, and being, as it were, a St. Lawrence in miniature. One lake, or rather pond, is too singular to be overlooked. On the Athabasca pass of the Rocky Mountains, where the road, little better than a succession of glaciers, runs through a region of perpetual snow, a small body of water, named by the Hudson's Bay Company's voyageurs as the "Committee's Punch-bowl," sends its tribute from one end to the Columbia, and from the other to the Mackenzie. To proceed southwards along the continent, Central A. abounds in lakes. The Leon and the Nicaragua have been already noticed. But such bodies of water are perhaps most numerous on the table-land of Mexico, or as it is often termed, the plateau of Anahuac. The largest of these is Chapala, estimated to contain 1300 sq. m.—an area, which, however insignificant in comparison with the great lakes of the n., is more than equivalent to a circle of 40 m. in diameter. Many of these reservoirs of the table-land have no outlet. Such is the case with the various lakes of the valley of Mexico, inclosed as they are by mountains at a height of 7471 ft. above the sea-level. Of the same description, too, is the lake of Titi-

caca, decidedly the largest in South A. Raised by the table-land of Peru and Bolivia to a height of 12,846 ft., it yet has no outlet to the sea; for the Desaguadero, which empties it, loses itself in the apparently landlocked lake Uros to the southward. Of this great body of water, the magnitude is not so well ascertained as its altitude. Besides such round numbers as 16,000 and 5000 sq. m., which are never meant to be accurate, one is perplexed to meet statements so minute, and yet so discordant, as 4032 and 2225 square miles. But even the lowest estimate is more than equivalent to a square of 47 m. a side—an area which, with a depth ranging up to 120 fathoms, exceeds, perhaps, anything to be found to the s. of the basin of the St. Lawrence.

The vast advantage in point of fluvial communication possessed by the new world over the old, has already been adverted to. There is, however, a hydrographical feature in which one of the grand divisions of the eastern continent is decidedly superior to A. The coast-line of Europe, in proportion to extent of surface, is incomparably longer than that of even the northern half of the western continent. This is at once apparent on glancing at the two maps. It is surely a suggestive fact that the two portions of the earth which are best fitted for human intercourse are also hydrographically so connected as to be beyond comparison the most accessible to each other. The dividing sea, besides being itself physically by far the narrower of the two intercontinental oceans, is virtually narrowed still more by its winds and its currents. Along a belt of about 30° on either side of the equator, the easterly trade with its attendant current wafts the voyager westward from Africa; while above that belt the reaction, strengthened and accelerated by the peculiar formation of the Caribbean sea and the gulf of Mexico, is ready to carry him round again to Europe, under the double pressure of the Florida stream and its generally prevailing breezes from the south-west. Nor yet can the hydrographical relations of A. with Asia be denied their proportion of significance and influence, linked as the two continents are by Behring's strait, and twice bridged as is their ocean, first by the Aleutian isles—a continuation of the Kuriles and Japan—and then by the Polynesian clusters, that series of offshoots, as it were, from the Indian archipelago.

*History.*—We propose to glance at this under the three heads of aboriginal ages, discovery, and colonization.

As to the *Aboriginal Ages*, there arises a question, too interesting to be overlooked, and yet too doubtful to be solved, as to the origin of the native tribes and peoples of A. Without prejudicing the question (which will be considered under *INDIANS*) whether the aboriginal inhabitants of A. are to be considered, in an ethnological point of view, as substantially of one stock, it appears highly probable that they did not all spring from one and the same primeval band of adventurers; in other words, that different colonies, voluntary or involuntary, must have reached the new continent at different times. This view, to say nothing of the direct testimony of local traditions, seems to be in itself more than probable, when we consider that, through the length and breadth of the universal ocean, even the most insignificant specks of land had each received, at least, one influx of human wanderers. But, beyond such probabilities, and such traditions, the view in question is strengthened by facts, which it is difficult otherwise to explain—by diversities of language, by different degrees, or kinds, of civilization, and, above all, by monuments, architectural or otherwise, of defunct races of by-gone days. On this supposition, whence came the successive shoals of invaders? To this question no direct answer can be given. We can only scan the various routes by which, previously to what we call the discovery of A., the old world was most likely to people the American continent. To begin with the natural routes on the side of the Pacific—Behring's strait, the Aleutian isles, and the Polynesian archipelagoes—we can hardly conceive anything but barbarism having been conducted to A. by any one of them. The country which stretches back from Behring's strait to the Kolyma, may be asserted to be, without exception, the most inhospitable portion even of Siberia; and, moreover, the strait itself has more probably been a channel of migration from America than from Asia, the Tchuktchi of the latter regarding themselves rather as a branch than as the stem of the Tchuktchi of the former. With respect, again, both to the Aleutian isles and the Polynesian archipelagoes, the successive stepping-stones in either series, instead of being presumed to have been so many halts for Asiatic Columboes and Magellans, must rather be viewed as each a mother-country to a new colony, as each a point of departure for a fresh swarm. Thus would the ever aggravating blight of isolation—exemplified even in the old world among the Laplanders, the Kamtchadales, and the Hottentots—prepare at each remove a deeper and deeper barbarism to land at last on the western shores of A. Further, if civilization, as certainly appears to have been the case, ever did find its way to A., it must have come directly and immediately from the old world, and that under circumstances and conditions of by no means a favorable character. In remote times, such accidental, or, to speak more correctly, unintentional visits of Europeans and Asiatics may have occurred, as we know to have actually taken place in more modern days. Japanese junks have repeatedly been driven, by stress of weather, across the Pacific to the new world; and again, on the Atlantic, the easterly trades, within eight years after Columbus's earliest voyage, wafted the unconscious Portuguese to Brazil, during their second voyage to India—the very first, in fact, which they had attempted by steering clear of the headlands of Africa. Such incidents, however frequently they might have happened, were much more likely to civilize existing communities than to found new ones; and it is at least a curious fact, that the only

aboriginal nations which could be regarded as in any sense civilized at the date of the Spanish conquest, pointed in their traditions to such events as we have endeavored to describe. Mexico and Peru had each had its Cecrops, or semi-divine civilizer—the former referring him to the east, across the Atlantic, and the latter to the west, across the Pacific. How far such hypotheses may account for the admitted facts, we are not left altogether to conjecture. Isolated individuals of our own nation have enabled us to bring the light of the present to bear on the past. When we consider what William Adams achieved in Japan, 200 years ago, and what John Young and James Brooke have, more recently, effected in the Sandwich islands and in Borneo, we can perhaps more easily understand certain undeniable traces and traditions of aboriginal civilization.

*Discovery.*—Whatever may have been the kind and degree of aboriginal civilization, A. was not destined to be the perpetual inheritance of the red man. New actors were to appear on the scene, before whom the old possessors were in a great measure to pass away.

Previously to the times of Columbus, Europeans had certainly visited A. The Scandinavians, after having colonized Iceland in 875 A.D., and Greenland in 983, had, by the year 1000, discovered A. as far down as  $41^{\circ} 30'$  N. lat., a point near to New Bedford, in the state of Massachusetts. These Scandinavians afterwards settled in the neighborhood—the mother-country, most probably through the intervention of Iceland and Greenland, maintaining an intercourse with the colony down to the 14th century. But these enterprises do not appear to have left any special impress on the character or prospects of the new continent, being more akin, perhaps, to similar incidents of yet earlier ages, than to the long-meditated and well-matured scheme of the illustrious Genoese. Subsequently to the Scandinavian discovery, and previous to that of Columbus, A. is believed by some to have been visited by a Welsh prince. In Cardoc's *Historie of Cambria* it is stated that Madoc, son of Owen Gwynnedd, prince of Wales, set sail westward in 1170 with a small fleet, and, after a voyage of several weeks, landed in a region totally different both in its inhabitants and productions from Europe. Madoc is supposed to have reached the coast of Virginia. Neither this, however, if true, nor the earlier Scandinavian expeditions, can be said even to have formed a connecting-link between the A. of the red man and the A. of his white brother. Even if the northmen had possessed resources worthy of their heroic courage, the old world was not yet ripe for the appropriation of the new.

At the end of the 15th c., however, science and politics were alike strengthening Europe for its task. The mariner's compass and the astrolabe had facilitated long voyages out of sight of land; while, in almost every country of Christendom, various causes were consolidating government, and promoting the growth of population—a position which derives, perhaps, its best illustration from the fact that the capture of Granada—the last foothold of the Moslem in Spain—preceded by only a few months the discovery of A.

Columbus (q.v.) set out on his great enterprise to discover A. under the patronage of the crown of Spain, on Friday, the 3d of Aug. 1492; at which date, properly speaking, begins the deeply interesting history of A. Had the Atlantic been broader, or had not the easterly trades wafted Columbus almost on a parallel from the Canaries to the Bahamas, he must have failed in his bold attempt; and in fact, those same easterly trades, assisted by a still nearer approach of the two continents, speedily proved their own value in this respect by carrying the Portuguese, without their own consent, to the shores of Brazil. Nay, Columbus's discovery of A., if not so accidental, was quite as unintentional as that of the Portuguese. It was towards the e. that his hopes directed his western course, hopes whose supposed fulfillment still lives in the misapplication to the new world of the terms Indian and Indies. Much of our subsequent knowledge of A. has been owing to the same desire of reaching the East Indies that led to its discovery. The gorgeous east was the aim alike of Davis, Baffin, and Hudson at the n., and of Magellan, Schouten, and Lemaire at the s., to say nothing of the earlier enterprise of Balboa on the isthmus of Darien; while, under a similar impulse, the French of Canada were ascending lake after lake as nature's ready-made highway to the same goal. Even to more recent times may these remarks be applied. While the eastern coasts of Africa, and the upper shores of Asia, as not bearing on the grand question of oriental traffic, were comparatively neglected and forgotten, our own Cook and Vancouver, in quest of a passage between the two oceans, surveyed every nook and cranny of A. from Columbia river to Behring's strait. Nor yet have the aspirations of Columbus and his noble band of successors and imitators been altogether disappointed. That same continent which, in their case, barred a westward advance along nearly the whole interval between the arctic and antarctic circles, has to us already become, or is gradually becoming, more than a substitute for the ocean which it was found so extensively to displace. By means of the railway across the isthmus of Panama, the Carribean sea, whether for passengers or for goods, is virtually nearer to the Pacific than an open channel could have rendered it to any sea-going vessels. Nor is it merely across the scanty span of Central A. that art is outstripping nature in the race. The Pacific railroad now spans the vast territory of the United States, from Omaha to San Francisco, and brings the e. and w. shores of the great continent of North A. within three days' journey from each other. The length of this line is nearly 2000 miles. Nor is this the only line of communication between the Atlantic and the Pacific. The Pennsylvania railroad, originally connecting Philadelphia with

Pittsburgh, now embraces an uninterrupted line from ocean to ocean, with numerous branch lines, and forms the longest line of railway in the world, being 4000 m. in length.

But Columbus found something better than what he himself or his successors and imitators looked for. He had discovered a land which, besides eclipsing India in the richness and variety of its commerce, was to confer on Europe a still more solid benefit. Colonization, which, since the early ages of Greece, had slumbered for 2000 years, received an impetus which, after building up empires in the west, was to build up others in an east richer far than that which was so long the loadstar of European navigators—an east where, almost without a metaphor, the grass was to be wool, and the stones to be gold.

The first fruits of Columbus's enterprise were the Bahamas, Watling's island probably being the spot where he landed on the 11th of Oct., 1492. Without attempting, in so summary a sketch as this, to distinguish the results of each of his four voyages from each other, it may be sufficient to state that this great man, besides Hispaniola, or St. Domingo, Cuba, Jamaica, and others of the Antilles, discovered and explored Central A. from Honduras southward along the coast of Veragua, and South A. from the mouths of the Orinoco westward, as far as Margarita. It was on this last-mentioned scene of his operations that he was followed by Hojeda, whose pilot, Amerigo Vespucci (q.v.), has been allowed to wrest from Columbus the glory of giving his name to the new world. Within twenty years after Columbus's first discovery, Ponce de Leon discovered Florida; and, what was certainly of far more consequence, he ascertained that, through the strait which separated that peninsula from the Bahamas, there constantly ran a strong current to the n.e. In 1513, again, just one year later, Vasco Nunez de Balboa crossed the isthmus of Darien to the Great South sea, or, as it was afterwards named, the Pacific ocean. About thirteen years before this last event, almost immediately after Columbus's own continental explorations, the interval left between his most southerly point from Honduras, and his most westerly point from the Orinoco, was, in a great measure, filled up by the voyage of Bastidas. To the s., again, of the Orinoco, Pinzou and Solis sailed along the continent down to 40° s. lat., between the years 1500 and 1514. The former, after anticipating, by a few months, the Portuguese on the shores of Brazil, had seen the Amazon; and the latter, sent out for the express purpose of entering, if possible, Balboa's Great South sea, found his way into the La Plata or Plate, being there slain by the neighboring natives. Moreover, to return to the northward, by the year 1519, different navigators had between them completed the examination of the gulf of Mexico. Within twenty-seven years, therefore, after Columbus's first departure from Spain, the eastern shores of South and Central A., had been almost continuously explored by the Spaniards down to within 15° of the southern extremity of the continent.

Nor had other nations been idle in the n. The Cabots, on behalf of England, had discovered Newfoundland, and portions of the adjacent continent, in 1497. In 1500, the Portuguese, under the Cortereals, sailed along the coast of Labrador nearly up to Hudson's bay, having, it is supposed, entered the gulf of St. Lawrence, long known among them as the gulf of the Two Brothers. Thus gradually there grew up the opinion, since proved to have been the true and sound one, that any practicable passage between the two oceans must be looked for towards the s. of the Plate. Accordingly, in 1519, Magellan, a Portuguese in the service of Spain, undertook the voyage in which was discovered the strait that bears his name—a voyage which furnished the first instance of the circumnavigation of the globe. Thus there remained little to be done, unless in the extreme n. and the extreme s. In the extreme s., Schouten, a Dutch navigator, discovered, in 1610, the passage round cape Horn; while, six years thereafter, Lemaire, a mariner of the same nation, passed through the strait of his own name between Staten Land and Terra del Fuego. Towards the n., again, the French and English divided the labors and honors of the enterprise between them. Scarcely had Magellan's companions—for he had himself been killed—returned to Europe, when Vexazzano, under the auspices of Francis I. of France, sailed along what are now the Atlantic shores of the United States, thereby connecting the discoveries of the Cabots with those of Ponce de Leon; and again, about ten years later, Jacques Cartier, in the service also of the same prince, explored the gulf and river of St. Lawrence, penetrating as far to the westward as the island of Montreal. In the extreme n., however, the English may be said to have been without a rival. It is unnecessary, in this summary sketch, to do more than mention names which tell their own story on every map—Davis, Baffin, Lancaster, and Hudson. (See these heads.)

To pass now to the western coast of A. The conquerors of Mexico and Peru effected, in a few years, more perhaps than they left behind them for future ages to effect, ranging along the coast from the southern extremity of Chili to the peninsula and gulf of California. Beyond lower California, the only direction in which there was much to do, the English Drake, whose voyage took place in 1578, divided with the Spaniards the credit of having discovered upper California. For nearly two centuries, excepting the half-fabulous voyages of Fonte and Fuca, the Spaniards and the English alike slumbered over their task; and it was not until towards the close of the last century, that Cook and Vancouver co-operated with Spanish and American navigators in dispelling the mystery that had so long hung over the n.w. coast of A.

To advert to *inland* discoveries: As early as 1537, within six years after the landing

of Pizarro in Peru, and within two after the founding of Buenos Ayres, the Spaniards met each other on the eastern borders of Peru, from the opposite shores of the continent; and, in 1540, within three years more, they sent forth that eastward expedition which ended in Orellana's exploration of the Amazon, from its source to its mouth. In the northern half of the continent, similar enterprises were of a much later date. It was in 1682 that the French first descended the Mississippi; it was in 1771 that Hearne traversed the wilderness from Hudson's bay to the mouth of the Coppermine; and it was respectively in 1789 and 1793 that Alexander Mackenzie reached the mouth of the river that bears his name, and passed through what is now British Columbia, to the shores of the Pacific ocean.

*Colonization.*—Among the European powers that colonized A., the most prominent were Spain, Portugal, France, and England.

Spain, of course, took the lead, having, with few exceptions, accomplished its task before any rival state had entered on its share of the work. In one respect, its colonies differed from all others on the new continent. Spain alone came in contact with civilization, such as it was among the aborigines; and accordingly, in the cases of Mexico and Peru, colonization required to be preceded by something like regular war and formal conquest. But, notwithstanding this peculiar obstacle, the colonies of Spain grew at first with a rapidity which, perhaps, has scarcely found its parallel even in the somewhat congenial case of Australia. As an illustration of this—for the statement needs no proof—it was colonial resources that armed Cortes and Pizarro for their respective enterprises. Without the direct and immediate aid, in either instance, of the old country, Cuba, within 27 years after the first discovery, equipped the conquerors of Mexico; while the town of Panama, only 12 years later, sent forth the adventurers that were to subjugate Peru. So unexampled a degree of vigor and vitality continued to advance in Spain's transatlantic possessions, precisely while they were so organized and conducted as to afford scope to individual ambition. Never, perhaps, was this scope sufficiently free and full, for, even from the beginning, government often embarrassed and blighted the fairest schemes by its jealous and suspicious interference. But, for a time, it generally found its account in tolerating the unrestricted liberty, or license, of its instruments. It was, therefore, only after law and order were established, and the original actors had disappeared from the scene, that the authorities of the mother-country stereotyped, as it were, their despotism along the length and breadth of every colony. From that moment, vigor and vitality were succeeded by stagnation and torpor. Still, with such elements of prosperity on every side—above the earth and below it—material interests could not fail to flourish. But the soul had fled; the body alone remained behind. Under these circumstances, Spain, though continuing to claim the entire continent to the n., more especially on the Pacific, did very little to enforce its pretensions. To this remark, New Mexico and upper California were the only exceptions. It was not before 1594 that New Mexico was at all occupied; and it was not till a century later that the province, after 10 years of bush-fighting, was finally subdued; while it was only in 1767 that the Franciscans, on behalf of Spain, took possession of upper California. But Spain never abandoned the hope of extending its dominions towards the n.w. coast. As late as 1790, that power, while restoring Nootka sound, and acknowledging England's right of planting other settlements, took the precaution, useless as it proved, of expressly reserving a similar right to itself; and it was only in 1819, nearly 30 years later, that Spain formally ceded to the United States all its claims to the coast above the parallel of 42°. See further under the separate head of AMERICA, SPANISH.

The efforts of Portugal, in the cause of American colonization, were at first less energetic than those of Spain. In fact, Portugal, which had doubled the cape of Good Hope in the year 1497, was so zealously engaged in the east as to allow an age to elapse before sending any colony to Brazil. The discovery of the country took place in 1500; but its colonization only in 1531, or rather 1548. Within 32 years thereafter, in 1580, Brazil, at the same time as Portugal itself, was annexed to the Spanish monarchy, soon afterwards falling, in this its new character, partly into the hands of the revolted Hollanders. In 1640, Brazil, as well as Portugal, threw off the Spanish yoke with the help of the Dutch settlers. But the continued presence of the latter retarded the progress of the colony. It was only after their expulsion, that the Portuguese, who had lost nearly everything in India, turned their attention more largely to Brazil. It accordingly became the most flourishing colony, as such, to the s. of the English settlements; and, as the refuge of the house of Braganza from French domination, it received, about 50 years ago, an impetus which has rendered it, as an independent state, the most flourishing power of southern America.

France, as the claimant to the basins of the St. Lawrence and the Mississippi, may be said rather to have pitched camps than to have planted colonies in those vast possessions. She regarded A. chiefly as a supplementary battle-field for England and herself. Every French settlement was but an inert part of a political machine, powerful, indeed, but unwieldy, expensive, and unproductive. The government was everything, and the individual subject was nothing. Hence, neither Louisiana nor Canada at all realized our idea of a colony. In corroboration of this may be cited two authentic and official facts. As an encouragement to marriage, rewards and exemptions were held out to the parents

of three children; and the erection of a dwelling on a lot of less than 40 arpents (about 32 acres) was prohibited by a royal ordinance. In 1762, France gave up Canada to England, and, as an indirect concession also to the same power, transferred Louisiana to Spain—events which, singularly enough, did much to facilitate France's grand scheme, the separation from England of her old colonies.

England, the most energetic and successful of all in the work of colonization, was the last in the field among the four powers already mentioned. Among her continental colonies, to say nothing of Newfoundland, Virginia, the oldest, was established in 1607, just 4 years after the union of the crowns; and Georgia, the youngest, as late as 1733. With these two exceptions, the remaining 11 were, one and all, founded during that period of civil and religious troubles which, in the mother-country's own history, sent one Stuart to the scaffold, and drove another into exile. In 1620, Massachusetts was occupied by the Puritan fathers; in 1633 and 1631 respectively, New Hampshire and Connecticut were first settled; in 1634, Maryland was granted to lord Baltimore, a Roman Catholic nobleman; in 1636, Rhode Island became a refuge from the sectarian intolerance of Massachusetts; in 1653, North Carolina became an offshoot from Virginia; in 1664, New York, New Jersey, and Delaware were taken from the Dutch; in 1670, South Carolina was established; and in 1682, Pennsylvania was granted to William Penn, the Quaker, continuing to be a proprietary government down to the revolution. In nearly all these cases, the civil and religious liberties for which chiefly the colonists expatriated themselves, were secured by liberal, nay, virtually republican charters. Subject only to the appointment of a governor on the part of the crown, every colony was practically a state within itself; and it is a suggestive fact that the very earliest assertion of legislative superiority on the part of the mother-country was 7 and 8 Will. III. c. 22, which, however, only operated negatively by forbidding every colony to make laws repugnant to those of England. With such aspirations and such institutions, the enterprising inhabitants of a new home could not fail to prosper; while their prosperity was rendered more solid and permanent by the comparative poverty of a region where steady industry, in agriculture or in the fisheries, was, at it were, a necessary of life. Under these circumstances, the germs of political independence were at work long before the year 1765; and it is not merely a probability, but a fact, that the expulsion of the dreaded power of France from Canada and Louisiana, in 1762, was closely connected with the troubles which so soon began.

The colonization of the West Indies, Guiana included, will be seen at a glance in the appended table of American governments.

It may be added, in conclusion, that the whole of A. is now in the hands of European races, excepting only the aboriginal Araucania to the s. of Chili, and the African republic of Hayti, otherwise known as Hispaniola or St. Domingo, the oldest among the colonies of Spain.

*American Antiquities.*—The architectural remains, to which we have already alluded in connection with a general estimate of aboriginal civilization, are to be found in each of the grand divisions of the new continent. To begin from the north. That portion of the United States which lies between the Appalachians and the Rocky mountains presents in three groups at once the oldest and the rudest monuments of by-gone times: the first group extending from the sources of the Alleghany to the waters of the Missouri; the second occupying the Mississippi valley, vaguely so defined; and the third stretching from South Carolina to Texas. These several groups, apparently with very little difference among themselves, consist of numberless mounds, and circumvallations of earth and stone—1500 of the latter, and 10,000 of the former, being said to stud Ohio alone. The erections themselves range from 5 to 30 ft. in height; while the areas inclosed—generally of some symmetrical figure, such as circle or ellipse, rectangular parallelogram or regular polygon—vary from 20 to 40 acres, though among a few of greater extent, one in Arkansas is stated to embrace a square mile. The circumvallations, moreover, seem generally to contain the mounds; and sometimes a smaller circumvallation is surrounded by a larger one. Whether these colossal structures were intended for worship or for defense, it is impossible to decide; more probably, however, they were of a military character, provided, as they ordinarily were, with cisterns for water. But, whatever their origin, they derive interest from the analogous fact, that, within the same territorial limits, have been dug up vases of earthenware or copper in elegant forms, pipe-bowls decorated with human heads of the type of the existing aborigines, or with those of birds, etc., domestic utensils, personal ornaments, hatchets of stone, and, lastly, weapons of copper or mica, or shell or obsidian.—The architectural remains of Central and South A. are at once of more modern origin and more elaborate character, and may be roughly compared with the cyclopean ruins in Italy and Greece. Uniformly in the pyramidal style—a style likely enough to be indigenous in a region of earthquakes—they are composed of blocks generally huge, and sometimes enormous; those in the walls of Tiahuanaco in Bolivia being equivalent to cubes of about 16 ft. each way. Between those of South A. and Central A., however, there are diversities as well as resemblances. Those of South A., situated, as they are, within the native limits of Peru, and referred, as they must be, to its closing era under the incas, cannot reach back beyond the Spanish conquest more than 300 or 400 years: the principal ruins are those of Tiahuanaco, already mentioned; of a temple on an island in lake Titicaca; of another edifice of the kind at Pachacamac,

not far from Lima; and of the palaces and mausoleums of the royal race. Those of Central A., again, are reckoned to be considerably more ancient, reaching five or six centuries further back, and being partly the work of the Aztecs, whom the Spaniards conquered, and partly of the Toltecs, whom the Aztecs had themselves supplanted. Nor is the fact altogether without significance, that, in the two more southerly divisions of the continent, those mysterious records of the past are generally superior in development in proportion as they are anterior in age; those of Central A., as a whole, surpassing those of South A.; and, again, within Central A. itself, the earlier specimens of Oaxaca, Guatemala, and Yucatan, eclipsing the later ones of Mexico proper. While attempting, in the light of these remains, to appreciate aboriginal civilization, we cannot fail to be struck rather with their magnitude than with their beauty, rather with the evidence of despotism in the ruler than with traces of skill in the subject—Stonehenge affording us infinitely more of a parallel than Windsor castle or Westminster hall. Nor does the sculpture, so often subsidiary to the architecture, lead to a more favorable inference, being generally rude and clumsy, and sometimes grotesque and hideous. The only safe conclusion is this, that, in the new world as in the old, there were different degrees of civilization; some of them confessedly higher than one could have expected in the utter absence of the useful metals, and the almost utter absence of beasts of burden. Nor has even this conclusion any necessary bearing on the better organized communities at large. Stray visitors of a higher type might have produced all the phenomena—visitors precisely such as appear to have figured in the traditions both of Mexico and Peru.

*Geology.*—The geology of the new world presents some remarkable contrasts to that of the districts in the old world which have supplied the types of geological classification. None of these is more striking than the enormous extent of country which one formation occupies, and that without interruption. It has long been noticed that the rock-structure of islands is more varied than that of continents; and thus it is that the inhabitants of the British isles have been to some extent compelled to become acquainted with geology. A journey of a few hours presents to the traveler rocks which, as regards both their mineral and fossil contents, are widely different. In A., on the other hand, one may travel for days over beds belonging to a single epoch. American strata often stretch from the Atlantic w. beyond the Mississippi. They have, on the whole, been subjected to few disturbing agencies; as is evidenced by the absence of any true mountain-range, except the Appalachians, e. of the Rocky mountains. The rocks of Britain, from their disposition and variety, have been, so to speak, the "primer" and "pocket manual" of this science, and will always continue to be the "*eude mecum*" of the geologist: but should he desire to peruse the large "folios" that contain the stony records of our earth's history, in their order and natural vastness, he must betake himself to the new world.

It is not many years since attention was first directed to American geology, but during the short time that has intervened, its progress has been very remarkable. This has resulted from the appointment of a geological staff in connection with nearly every province of the United States, from the vigorous operations of the Canadian survey under Sir W. E. Logan, and from the observations of arctic explorers, whose frequent visits to these regions in search of the ill-fated Franklin have supplied data for the exposition of their natural history. Humboldt, though the first, is yet the most important of S. American observers. The numerous facts recorded by him have been confirmed and added to by recent travelers. Data have been thus supplied to form an approximate estimate of the geological structure of this portion of the American continent.

The names of N. American observers are almost past reckoning, yet the various systems may be said to have been chiefly laid open by four sets of observers—Morton for the cretaceous, Conrad for the tertiary, Hall and the New York geologists for the palæozoic, and the professors Rogers for the carboniferous strata and the Appalachians.

In the following rapid sketch of this subject, we can do nothing more than glance at the various formations, and must refer for details to the articles under the different divisions of America.

The oldest strata are a range of CRYSTALLINE ROCKS which, in North A., occupy an area that extends from the northern shores of lake Superior and the banks of the St. Lawrence, n. w. to the Arctic ocean, and lies between the line of minor lakes (Slave, Winnipeg, etc.) and Hudson's bay. The average width of this area is about 200 m., and its length from lake Superior to its termination on the shores of the Arctic sea is more than 1500 miles. The rocks are chiefly gneiss, with granite and trap. They form a flat plateau, very little elevated above the surrounding country, and only in the Copper mountains rising to the altitude of hills, the highest of which is 800 ft. above the sea-level. In this immense plain we have an example of the great characteristic of American geology—the tranquil operation of an upheaving force, exerted over a wide area, with limited and regulated intensity, and constancy of direction. This series of rocks stretches over nearly the whole of the eastern portion of South A., extending from the northern shores to the mouth of the La Plata, being, however, hidden in the valley of the Amazon by its alluvial deposits. The same rocks form the western slopes of the Andes and Rocky mountains, and the plains of Russian A. In the central district, in which we first traced them, they dip e. and w. under the silurian strata. They are them-

selves free from superincumbent beds, showing that even in the silurian age they formed dry land; and ever since, although subject, like the rest of the world, to great oscillation, it has apparently held its place with wonderful stability, for it is now, as probably then, not far above the level of the sea.

On either side of this tract there exists, as we have said, a SILURIAN district. That on the eastern side, reaching to Hudson's bay, has a low and uniformly swampy aspect; the strata are hid by superficial deposits, chiefly bowlder clay or drift, large boulders from which are scattered along the shore. The silurian rocks under which the crystalline strata dip on their western limits, cover a large extent of the North American continent. They have been traced from Canada and New England, bounding the southern limits of the azoic rocks along the line of the great lakes, and extending in a broad band of some 200 m. parallel to the more ancient formation, probably till they reach the Arctic ocean. These rocks are only slightly developed in Southern A., on the eastern slopes of the Andes.

The silurians have been divided into *lower* and *upper*, and each of these contains three periods. Beginning with the lower, we have first the

*Potsdam period*, comprising beds of slate and sandstone, and containing fossils representative of the three great divisions of the animal kingdom—mollusks, articulates, and radiates. Next follows the

*Trenton period*, a period of limestones indicating a sea of greater depth, and teeming with life, for some beds are composed entirely of shells and corals.

Another change, and rocks of a clayey and shaly structure are deposited, containing numberless zoophytes and other fossils, and forming the *Hudson period*.

The upper silurian division also comprises three epochs: *The Medina and Clinton*, composed of sandstones and shales; then *the Niagara and Onondaga*, with limestones and saline rocks; and, lastly, *the lower Helderberg period*, a richly fossiliferous series of limestone rocks.

The silurian beds on their southern and western borders dip under the devonian rocks, which are developed to a large extent north of lat. 72° n., where they appear to rest upon the azoic rocks. They have been divided into five periods: *Oriskany, upper Helderberg, Hamilton, Chemung, and Catskill*.

Vast beds of conglomerate overlie the devonian rocks, and form the basis of the CARBONIFEROUS strata. This formation covers large districts in New Jersey and Pennsylvania, and in the Ohio and Mississippi valleys, with an enormous thickness of limestone, shale, and other beds, which still continue parallel to the previous. At the close of the carboniferous epoch, the whole character of North A. was altered by the formation of its mountain systems. No hill higher than Copper mountain seems to have existed at this time, although the land occupied much the same area, and had a similar outline as at present. The professors Rogers, having with perfect success unraveled the contortions of the Appalachians, have shown that the silurian, devonian, and carboniferous strata, which were originally laid out in horizontal layers, were afterwards pressed on to the north-westward, and folded up till the folds were of mountain height. To similar causes do the Rocky mountains and the Andes owe their origin—only the directions of the forces are different.

The Appalachian fires have long been extinguished; they have, however, left traces of their former violence in the highly metamorphosed silurian and carboniferous rocks of New York and Pennsylvania, which were long supposed to be primary granite, etc. The igneous agency, which at first raised the western range, is still active at intervals throughout its course.

There seems to have been a rest in the deposition of sedimentary strata at this time. The only activity was that of the earthquake and the volcano. Two whole formations—the permian and triassic—have no place in the rock-structure of A. The first renewed signs of life are discovered in the sandstones which occupy the valleys on the eastern side of the Appalachians. In these beds, which belong to the OOLITIC period, occur the tracks of birds and reptiles, discovered and described by prof. Hitchcock.

In the CRETACEOUS beds which follow, evidence is given that the Mexican gulf extended far up the Missouri valley, and sufficiently deep to cover Texas and Nebraska with the beds which belong to this formation.

The TERTIARY formation is developed as a band of about 60 m., forming the southern extremity of North A., and stretching from North Carolina to the peninsula of Yucatan, leaving the coast-line only at the delta of the Mississippi. This formation occupies a large amount of the surface of South A. From Patagonia to Venezuela it can be traced occupying the space intervening between the base of the Andes and the azoic rocks of Brazil and Guiana. The older silurian and carboniferous deposits are not found in the positions they occupy in the northern continent; the gneiss, etc., dip directly under the tertiaries.—The valleys of the Amazon and the La Plata, and the mouth of the Mississippi, contain extensive *alluvial* deposits.

There only remain two post-tertiary beds, which, however, are of considerable importance—viz., the *boulder clay* and the *river terraces* or *loess*, containing the remains of the mastodon and of the elephant. The boulder clay occurs in the country n. of lat. 40° n., and in Patagonia in South A. Its characteristics are the same as that in the old

world—a stiff clay, containing bowlders of all sizes, some being as much as one or two thousand tons weight. The origin of this remarkable deposit is ascribed to the former prevalence of vast glaciers over the n. and s. parts of A.

The pampas of Southern A. are covered with a deposit of clay and sand, containing the bones of the megatherium and mylodon, genera allied to the sloths, and of the glyptodon, a huge armadillo. For details, see ANDES, APPALACHIANS, ROCKY MOUNTAINS.

*Botany.*—On the discovery of A., Europeans regarded with astonishment its vegetable and animal productions, so different from all that they had ever seen before. The difference between the productions of the old and new worlds is least remarkable in the most northern regions. Around the n. pole, a region having a flora and fauna which may properly be designated arctic, includes portions of the three continents of Europe, Asia, and A.; and many productions are common to these three continents throughout this region, whilst those which are peculiar to one, are generally represented in the others by species nearly allied. In A., this region extends to the northern shores of lake Superior. The polar bear haunts the arctic regions of the old and new worlds alike; and further s., in both, the beaver builds his dam, and is pursued for his skin. Pine and birch are the chief trees of all the most northern forests, and struggle on, dwarfed and stunted, towards the regions of perpetual snow; whilst the berries of different species of *rubus* and *vaccinium* (bilberry, etc.) are the last fruits which the soil offers to man during the brief summer of the north—alike to the Laplander and the Esquimaux.

More to the s., the flora and fauna of A. become more decidedly different from those of the old world; yet the difference consists not so much in the appearance of new families as in new species, replacing, so to speak, those of Europe and of Asia. The forests consist chiefly, as in these continents, of pines, oaks, birches, and willows; but the pines, and oaks, and birches, and willows are not the same as those which cover the plains and mountains eastward of the Atlantic. The same remark applies to poplars, elms, planes, maples, hazels, and other kinds of trees, and to plants of humbler growth, as roses, brambles, strawberries, bilberries, etc., the pasture grasses, and the common flowers and weeds, although umbelliferous and cruciferous plants are comparatively rare. Not unfrequently, also, forms occur more completely different from those of the other quarters of the world, and these become more numerous as we proceed southward, although the magnolias, which form so admirable a feature of the flora of the southern Alleghanies and other southern parts of North A., have recently been found equally to characterize that of the e. of Asia and of the Himalaya mountains, where magnificent species of rhododendron have also been discovered, rivaling or excelling those which are natives of the United States, and very different from the dwarf shrubs which represent the same genus on the mountains of Europe. It is remarkable that no true species of heath is found in A., although many shrubs of the same family occur, but none of them so strongly exhibiting the *social* character, or covering great tracts, as the heaths do in Europe. Where the climate begins to assume a tropical character, however, A. is distinguished by the abundance of the *cacti* (the prickly pear and its allies) which are found on its plains, often forming the greater part of their vegetation. The species of this order, so far as is yet known, are exclusively American, although some of them have been introduced into the warmer parts of the old world, and are now very common in the s. of Europe and elsewhere. The mountains of Mexico are, to a large extent, clothed with oaks and pines, most of them, however, different not only from those of the eastern continents, but even from those of the more northern parts of A. The flora of tropical A. resembles that of Asia and Africa in its palms, although these also are with few exceptions different in species; and the species are more abundant than in any other part of the world. It appears, indeed, that palm-forests like those of South A. scarcely exist elsewhere. The forests of the hottest parts of South A. produce also many remarkable trees of other kinds, among which may be mentioned the trees of the order *lecythidaceæ* (q.v.), one of them known as the cannon-ball tree, and all of them producing huge fruits, with thick hard shells, which are often used for domestic purposes; whilst within the shell of a particular species are packed together the well known Brazil nuts (q.v.) of our shops. In the waters of the same region has recently been discovered the *victoria regia*, the most magnificent of water-lilies, and for the growth of which, hot-houses containing ponds of water have been erected in our own country. The forests of this part of A. are so dense and full of underwood, and the trees so bound together by *lianas* or twining plants, that they are in many places impenetrable, and the animals which inhabit them either find their way among the branches, or by narrow paths, which they keep open by constant use. The treeless plains of South A., like those of North A., have, in general, much of a grassy vegetation. Part of the elevated regions of the Cordillera, within the torrid zone, is remarkably characterized by the presence of *cinchona*, which form its principal botanical feature, and yield the celebrated Peruvian bark. In still more elevated regions, *escallonia* and *calceolaria* give a novel aspect to a vegetation otherwise very similar to that of Europe in its general character, and containing saxifrages, gentians, and many other plants of genera common in the old world. The flora of Chili presents also some interesting points of resemblance to that of New Holland and New Zealand. An *araucaria*, now not unfrequent in our pleasure-grounds, appears as a representative of the pines; and its seeds afford a large part of the food of

the natives of the district in which it abounds. Towards the strait of Magellan, vegetation again assumes forms more similar to those of Europe. The forests consist in great part of peculiar species of beech. Barberries, different from those of other parts of the world, but very nearly resembling them, are particularly abundant; and with them occur brambles, saxifrages, gentians, primroses, etc. There are also vegetable productions very different and peculiar, as the winter's bark, which has obtained some reputation as a medicine. From this region are derived not a few of the fuchsia now so familiar an ornament of gardens, greenhouses, and cottage windows in Britain, and which are exclusively American.

Maize is one of the most important of the botanical productions of A. It is the only cultivated grain of American origin; it was in cultivation before the discovery of A. by Europeans, by whom, however, its value was soon recognized, and it has now become an important crop in climates suitable for it in all quarters of the world. The other grains have all been introduced into A. by Europeans, with the sugar-cane, the banana and plantain, coffee, cotton, flax, and many other plants now generally cultivated both in the tropical and temperate regions. The yam is regarded as amongst its native productions, common to its tropical regions with those of other quarters of the world. Tobacco is a native production of A., the cultivation and use of which extended from it to the old world, and rapidly became prevalent among a great part of mankind. (It is indeed supposed by some that there is a species of tobacco indigenous to the furthest east; but this, and the question of its use there before it was made known from A., are still involved in uncertainty.) But of all the vegetable productions of A., the potato is the most important and useful. We owe to it also the Jerusalem artichoke; and it produces several other plants, valuable for their roots and tubers, as the arracacha, the melloco, etc., the use of which has scarcely yet extended beyond their native regions. With them may be mentioned the quinoa, which is not a grain (the seed of a grass), but the seed of a species of *chenopodium*, or goosefoot, resembling the seeds of the cereal grasses in its qualities, and extensively cultivated on the high table-lands of Chili and Peru. Tapioca, arrow-root, cocoa, vanilla, pimenta or Jamaica pepper, and Cayenne pepper, are among the native productions of the tropical parts of A. The agave (q.v.) or American aloe, valuable both for its fiber and its juice, has now become common in the warm parts of Europe, and in similar climates in other quarters of the globe. The pine-apple is a native of tropical A., although now naturalized, or nearly so, in other tropical regions. Tropical A. and the West Indies produce also many other fine fruits, among which are the guava, different species of anona or custard apple, and of granadilla or passion flower.—The forests of North A. yield much valuable timber, chiefly consisting of different kinds of oak and pine. The black-walnut and hickory of the United States are also much esteemed. The West Indies and neighboring parts of the mainland yield mahogany; and from the same regions comes logwood, one of the most useful of dye-woods. The tropical forests of South A. produce many valuable timber-trees, of which perhaps the most deserving of notice are the greenheart (q.v.) or bibiri, and the mora. Brazil-wood and Pernambuco wood are among their dye-woods. One of the most remarkable productions of this region is the cow-tree (q.v.), the juice of which possesses many properties in common with milk, and is used instead of it. The milky juice of some othertrees of tropical A. thickens into caoutchouc.—Different parts of South A. produce *maté* (q.v.) or Paraguay tea, a species of holly, the leaves of which possess properties similar to those of tea and coffee, and afford a beverage which is extensively used, although not yet an article of export to other parts of the world; and the coca (q.v.), a shrub of which the leaf has been, from a remote period, employed by the Indians as a narcotic.

*Zoology.*—In the animal kingdom, as in the vegetable, all seemed strange and new to Europeans when they first set foot in A. Yet here also the difference from the productions of Europe is not so great as in south Africa or Australia. In North A., many of the animals, as of the plants, of Europe are represented by others of the same genera or families. A few are common to the old and the new world; and in some which are now regarded as specifically different, the difference is not so great as readily to attract the notice of unscientific observers. North A. has its elk and its deers, its oxen (the bison, called buffalo in the United States, and the musk-ox), its sheep (the Rocky mountain sheep), its beavers, hares, squirrels (some of them much sought after for their fur), mice, rats, weasels, bats, porcupines, bears, badgers, foxes, wolves, and several species of feline animals, among which are the puma and the lynx. The jaguar, more powerful and dangerous than any other of the feline animals of the new world, and the only very formidable beast of prey which it produces, inhabits the tropical forests of South A. The warm parts of South A. produce the great tapir, peccaries, sloths, ant-eaters, armadilloes, etc.; but the elephant, rhinoceros, hippopotamus, and boar of the old world, have no more nearly allied representatives. The llama and its congeners, among which is the alpaca, are peculiar to South A., inhabiting the Andes of Chili and Peru. Of the animals of the old world, the most nearly allied to them is the camel, which is entirely wanting in the new; as was also the horse (with all its congeners), until it was introduced by Europeans—a sight of wonder and of terror to the Mexicans and Peruvians who first found themselves opposed to Spanish cavalry, but now thoroughly naturalized,

and roaming in vast multitudes on the South American plains. The dog existed in A. before the days of Columbus; it existed in different varieties as a domesticated animal, and the same difficulty arises concerning the origin of the domesticated varieties as when those of the old world alone are considered. The chinchilla, so valuable for its fur, is a small quadruped, peculiar to the n. of Chili. The opossums of North A. were the first known of marsupial quadrupeds—i.e., those which have a pouch for their young—and are described as objects of great curiosity by the earlier writers on the new world and its productions. Monkeys are numerous in the warm parts of the new world as well as of the old, and of many species; but they are not only of different species from those of Asia and Africa; they form a different section of the monkey family. There are no apes resembling the orang-outang or chimpanzee, and no baboons; but all of the American monkeys have long tails, and many of them prehensile tails, the latter peculiarity being found in none of those of the old world. The absence of cheek-pouches is another character of the American monkeys.

Among the birds of A. are eagles and others of the same family, vultures (among which is the great condor of the Andes), owls, ravens, crows, herons, thrushes of many kinds (of which the mocking-bird may be mentioned as a species particularly interesting), finches, sparrows, buntings, warblers, wrens, larks, etc. Few, however, are identical in species with those of Europe or of Asia. Few things in the natural history of North A. are more remarkable than its multitudinous flocks of pigeons. There are numerous species of grouse and partridge. Of the large gallinaceous birds, the first place in importance must be assigned to the turkey, now so common in a domesticated state in Europe, although in a wild state it has almost disappeared from great part of its native regions. Alectors and curassoes are large gallinaceous birds of Mexico, Guiana, and other warm parts of A. Parrots abound in the tropical forests, and although only one species extends northward into the United States, yet in South A., birds of this family range to the southern extremity of the continent. Humming-birds are peculiar to A., and are found not only in its tropical but in its temperate regions, of numerous species, and many of them of dazzling beauty, passing like bees from flower to flower, and often constituting a characteristic feature of the scenes in which they abound. Toucans and aracaris are among the other kinds of birds peculiar to A., and are found in South A. alone. Swans, geese, and ducks, with other water-fowl of many kinds, exist in great numbers in North A., and in the warmer parts the brilliant colors of the flamingo enliven some of the coasts.

Serpents are numerous. Among them are boas, remarkable for their great size. Rattlesnakes, the most venomous and dreaded of the serpent tribe, are peculiar to A. Alligators abound in the rivers of the tropical and sub-tropical regions. Turtles are caught in great numbers in the W. Indian seas, and fresh-water turtles abound in some of the tropical rivers. The bull-frog is a native of the United States, remarkable for the loud noise which it makes, and which those who have been accustomed to it from their childhood learn to associate with all that is pleasant in nature. The lakes and rivers of A. abound in fish, of which many are of the salmon family, the common salmon itself being found as far s. as  $41^{\circ}$  n. lat., and some are of the sturgeon family. The cod-fisheries of the bank of Newfoundland and of the coasts of Nova Scotia are unequaled in productiveness; and herrings, and other species of the herring family, are taken in great numbers in the same seas.

Some parts of A. are grievously infested by mosquitoes and other insect tribes, the vast numbers of which are extremely annoying, so that some places on the banks of tropical rivers are rendered almost uninhabitable. Ants and termites, or white ants, are very abundant in some parts of South A. Many species of wild bees are found in the forests of Brazil, some of them very productive of honey; but the common hive-bee was unknown in A. till it was introduced from Europe. It has now become naturalized, and is found in the forests far beyond the settlements of white men. The cochineal insect of the opuntia is a native of Mexico and Central A., and the plant on which it feeds has long been cultivated there and in the West Indies for its sake.

*Political Divisions.*—The following are the chief political divisions of A., each of which will be described in its proper place. In North A., strictly so called, are British A. as commonly understood, the United States, and part of Mexico. In Central A. are the remainder of Mexico, Central A., in its political sense, comprising Guatemala, San Salvador, Honduras, Nicaragua, and Costa Rica; and, lastly, a small portion of the United States of Colombia. In South A. are the rest of Colombia; thence along the Pacific are Ecuador, Peru, Chili, and aboriginal Araucania; while round by Patagonia and Tierra del Fuego, the Atlantic washes Buenos Ayres, Uruguay, Brazil, Guiana, and Venezuela—the interior being occupied by Bolivia, Paraguay, and the Argentine Confederation. Finally, the West Indies consist of the Bahamas, the Greater Antilles, and the Lesser Antilles.

The annexed tables are compiled from the *Almanach de Gotha* (1879), the *Statistical Abstract* for the British colonies and other possessions, and the *Statesman's Year-Book*.

## 1. GOVERNMENTS OF NORTH AMERICA.

GOVERNMENTS.	Area in Square Miles.	Population.	Capitals.
Danish America (Greenland).....	34,300	9,800	Lichtenfels.
French Possessions.....	81	4,984	St. Pierre.
British North America:			
1. The Dominion of Canada, comprising the former independent governments of			
Canada East, or Quebec.....	193,355	1,191,516	Quebec.
Canada West, or Ontario.....	107,780	1,620,851	Toronto.
Nova Scotia.....	21,731	287,800	Halifax.
New Brunswick.....	27,322	285,594	Frederickton.
Manitoba*.....	13,923	11,503	Fort Garry.
British Columbia.....	213,000	50,000	New Westminster.
North-west Territory.....	2,934,040	28,700	Battleford.
Prince Edward Island.....	2,173	94,021	Charlotte Town.
2. Newfoundland.....	40,200	146,536	St. John's.
3. Bermuda.....	18	12,121	Hamilton.

Grand Total of America.....	15,634,385	87,535,092	

\* Part of Hudson's bay territory, formed into a province of the Dominion.

**AMERICA, BRITISH.** From the small beginnings specified in the general article above, British A., in the proper sense of the words, is now, in mere extent, at least equal to the American republic, and vastly superior to any other state in the western hemisphere—occupying, as it does, a breadth of about 90° of long., and stretching, with more or less interruption, over a length of 120°. Besides touching, actually or virtually, every considerable power on the continent, England, in the new world as in the old, commands nearly every turning-point in navigation and commerce. In co-operation with Ireland, Newfoundland has linked together the two continents by submarine telegraph. Again, with the gulf and river of St. Lawrence as its main artery, British A., in its ordinary acceptation, comprising Nova Scotia, New Brunswick, Prince Edward Island, and the Canadas, confederated in one "Dominion," has received from nature an advantage in respect of the western trade which even the energy of Pennsylvania and New York cannot counterbalance; Halifax, the Bermudas, and the Bahamas, are so many guardians of the gulf stream, freighted as it is with the exports of half a continent. Jamaica forms the first link of a chain which girds the Caribbean sea; Trinidad fronts the Orinoco, which is connected by the Cassiquiare with the Amazon; western Guiana, also, as already mentioned under another head, finds, up the Essequibo, its own communication with the "king of waters;" and, lastly, on the Atlantic side, the Falklands, with their Port Egmont, flank alike the river Plate and the strait of Magellan. Round, again, in the Pacific, British A. exerts an influence which is perhaps relatively greater. At the upper extremity of a coast which is, as a whole, singularly deficient in harbors, British Columbia, with its breastwork of islands from Vancouver's upwards, and its succession of indentations, bids fair, more especially with its inexhaustible supplies of magnificent timber, to form an admirable base of operations for sustaining the maritime greatness of Britain.

**AMERICA, RUSSIAN,** the name long given to what is now a territory of the United States, called *Alaska*, and which was purchased from the Russian government in 1867 for \$7,200,000. It forms the north-western extremity of the American continent, and is bounded n. by the Arctic Ocean, e. by British America, w. and s. by the Pacific. It was discovered by a Russian expedition conducted by Behring (q.v.), which sailed from Kamtchatka in 1731. It is little better than a vast hunting-ground, and was long held by the Imperial Fur Company, which differed but little from the imperial government itself. Its only town, or rather village, worthy of the name, is New Archangel (now called Sitka), on the island of Sitka. The most noticeable points in geography are cape Prince of Wales, on Behring's strait; Kotzebue's sound, Norton's sound, peninsula of Alaska, Cook's inlet, and mount St. Elias. See *ALASKA*, and *UNITED STATES*.

**AMERICA, SPANISH.** Spanish A. is now shrunk into Porto Rico and Cuba, and belongs rather to history than to geography. Yet for many years it embraced absolutely the entire continent. Its decay was caused by the colonists becoming mere hunters after the precious metals, instead of agriculturists, and by the exclusion of all but natives of the mother country from public employment.

**AMERICAN ALOE.** See *AGAVE*, *ante*.

**AMERICAN ECLECTIC, or NEW SCHOOL OF MEDICINE,** began to be known about 1825 as distinct from the "regulars," and in 1826 there was an eclectic college founded in New York by Wooster Beach, who was the author of several text-books for the school. Soon afterwards schools were established in Ohio and other states, and at a later period regular colleges in New York, Chicago and other cities. State societies were formed, and in 1870 The National Eclectic Medical Association was incorporated by the New York legislature. It has grown in influence, and now represents probably 13,000 to 15,000 physicians in all the states. The school flourishes also in the British provinces, and there is an eclectic association in England. The prominent feature of the school is the rejection of mercury and most other minerals in medicine, and the extension of simple hygienic treatment in disease, depending more upon the vital powers than upon extraneous aid. In place of minerals rejected they have added a hundred or more to the list of vegetable medicines.

**AMERICAN FLAG.** On the 14th of June, 1777, the continental congress resolved that the flag of the united colonies should show 13 stripes of red and white alternating, to represent the number of the colonies, with 13 stars in a blue field. This became the flag of the United States, and a star is added for every state added to the union. At present (1880) there are 38 stars. The width of the flag should be two thirds its length. Seven of the stripes, beginning with the outermost, are red. The blue field or union is square, and has the width of seven stripes. The U. S. revenue flag has 16 vertical stripes, alternately red and white, with a white union bearing the national arms in dark blue.

**AMERICANISMS** are words and phrases current in the United States of America, and not current in England. These peculiarities are much more prominent in conversation than in writing; indeed, in the American writers that are usually considered classical, it is difficult to detect anything of the kind. The number of absolutely new words introduced into the English language in America is remarkably small. As an instance may be mentioned *caveus*, for a secret political assembly. This is a corruption of *calk-house*, a calker's shed in Boston, where the patriots before the revolution had

usually held their meetings. The term *Yankee* (an Indian corruption of the French *Anglais*) is another. The great body of A. consist in giving an unusual sense to existing words: as *clever*, in the sense of amiable, and *smart* for clever; *wagon* for a very light kind of carriage; *book-store* for bookseller's shop; *wilted* for withered; *creek* for a small river, instead of a small arm of the sea.

The several divisions of the union have their characteristic peculiarities. Thus, in the New England states—Yankeeland proper—*ugly* is used for ill-natured; *friends* for relations (so used also in Scotland); and *guess* for a great variety of things—to think, presume, suppose, etc. This use of *guess* is confined to New England; the inhabitants of New York and of the middle states generally employ *expect* in the same way; while those of the southern states *reckon*; and those of the western states *calculate*. Several words current in the middle states are of Dutch origin, as *loafer* for a vagabond, from the Dutch *loopen*, to run; and *boss* for a head workman or employer. The southern states have fewer peculiarities than any of the other divisions. In the western states, again, there is hardly any recognized standard of speech, and in some districts "it would hardly be an exaggeration to say that every prominent person has his own private vocabulary." The verb *to fix* is made to do duty for expressing every conceivable kind of action. The vague use of this word is common all over the union, but in the west the abuse is carried to the extreme. *Help*, in the sense of servant, is common to the west and to New England, but is nearly unknown in the middle states. The well-known phrase *go a-head* is a coinage of the west; it is sufficiently expressive of the leading characteristic of the American people. *Posted-up* in a subject, for "well informed," is one of a class of metaphors indicative of the prominence of mercantile pursuits.

The tendency to the use of slang is excessive in America, especially in the western states. "Every state, every city has its own flash vocabulary; but it is in the political world that this tendency to cant phrases most develops itself. Every new party, every new modification of an old party, is bound to have at least one new name, either assumed by itself, or attached to it by its opponents."

A variety of causes have been enumerated to account for the existence of those deviations from standard English, such as, the influence of the Indian languages; the various tongues spoken by settlers from Europe other than English; the original provincial peculiarities of portions of the English settlers, etc. For instance, Dr. M. Shele de Vere, whose work, *The English of the New World* (1873), is the best on the subject, states that the largest of the so-called A. are good old English words which have become obsolete or provincial in the mother-country. But even supposing the language of the United States were at this moment in every respect identical with that of England, and to be henceforth unaffected by the importation of foreign elements, the complete identity could not be expected to continue long. Not only do new circumstances and wants make new terms necessary, and modify the application of old, but those changes of structure which constitute the organic growth of every living tongue, are evolved more or less rapidly according to the industrial and political activity of those that speak it. To complain, then, that the English language in America, or in any of the British colonies, should exhibit deviations from the standard of the mother-country is as unreasonable as to complain that an animal should exhibit changes in its coat or its habits when removed from one climate to another. Though it is certainly desirable that the language of the various sections of the Anglo-Saxon race should be substantially one, yet the general adoption of a new term or mode of expression by a great community may be presumed to have a cause deeper than any that can be controlled by criticism.

As the Americans of Anglo-Saxon origin do not exceed one third of the whole population of the United States, it seems wonderful that the English language should have held its ground so well—that it should not have been completely corrupted, or even in some places extruded by other tongues. Yet there is apparently no danger of this. The original Dutch of New York has disappeared, with the exception of a very few stray words; and although French is still spoken in one half of the city of New Orleans, it has been preserved at the expense of the speakers isolating themselves and losing their due influence. The proximity of the German-speaking population that still holds out in Pennsylvania, etc., has no sensible effect upon the language of their English-speaking neighbors; while, on the other hand, the influence of the English is reducing the language of the Germans to a corrupt patois, swarming with English words.—See *The English Language in America*, in the Cambridge Essays for 1855; Bartlett's *Dictionary of Americanisms* (1858).

**AMERICANISMS** (*ante*). This term can no longer be used as a reproach. It must be taken as indicative merely of the usage of the English language in a new English-speaking nation, with no reference to the question as to the propriety and worthiness of the new usage. While many A. bear the stamp of vulgarity, some spring from an undeniable necessity, and still others graft on the old stock a welcome grace and strength. Not all A. are strictly American; some are early English usages retained, or revived after the parent country had dropped them. It is now conceded that by the refined classes of people in some regions of the United States the English tongue is used in a purity and propriety not excelled in any portion of Great Britain.

The following are some of the more widely known A.: *Approbate*, for approve; "I approbate," etc. *Bad*, in the sense of ill. *Baggage*, for luggage. *Balance*, for remainder. *Boards*, for "deals;" in England "boards" has an application more general. *Bogus*, bad or counterfeit. *Border*, a strip of greensward along a wall or path; in England called "edging." *Boss*, from Dutch "baas," superintendent of labor; used by boys especially to all men not known or called by name. *Buggy*, a four-wheeled vehicle; in England, two-wheeled. *Buncombe*, empty or unnoticed talk; long ago a member of congress from a North Carolina county of that name was rallied for making set speeches to nearly empty chairs, when he replied that he did not care for hearers—he was "talking for Buncombe," i.e., for effect on his personal constituents. *Bureau*, a chest of drawers. *Calculate*, for think; "I calculate I can do it." *Calico*, in the United States, printed cotton; in England, unprinted. *Caption*, heading or title. *Clever*, good-natured. *Conclude*, in the sense of determine; "I conclude I will go." *In this connection*, for "in connection with this subject." *Corn*, maize only; in England, grain in general. *Creek*, a stream more than a brook and less than a river; in England, a small arm of the sea. *Creole*, properly people of European blood born in Spanish American territory; but used to mean natives of the south, especially of Louisiana, tintured with negro blood. *Deadhead*, one who travels on passes, etc.; any one who does not pay; the verb "to deadhead" is sometimes used. *Dry Goods*, all sorts of haberdasher's wares. *Dress*, for gown. *Elect*, for choose; "he elected to take the land." *Endorse*, for sanction or approve. *Eeventuate*, for result. *Expect*, for know or believe, as "I expect it was too late." *Fall*, autumn. *Fancy*, new, peculiar, desirable, or showy, as "fancy silks," "fancy note paper," "fancy horses;" applied to stocks it means those not in regular standing on the exchange; also it indicates an assortment of light wares, as "fancy stores." *Fleshy*, stout. *Freshet*, a sudden rise of water. *Gerrymander*, an arrangement of the bounds of electoral districts to favor party success; from Elbridge Gerry, who first practised the trick while governor of Massachusetts. *Hack*, a hackney coach; in England, a horse for casual hire. *Hold on*, stop; probably from German "Halt an." *Homely*, plain-featured; in English, home-like or unadorned. *Improve*, to clear wild land and establish farms. *Improvements*, buildings usually, but any addition which one has made to his place or property. *Loan*, as a verb for lend. *Lobby*, verb, to influence legislation, generally in an improper way. *Locate*, to settle upon, or to select a place. *Mad*, for angry. *Mail*, for post; we "mail" a letter, the Englishman "posts" it. *Notify*, to give notice to; in England, "to make known." *Obnoxious*, offensive. *On*, for in; we say "he lives on Tenth street," the English say "he lives in." *Pants* (vulgarism) or *pantaloons*, for trousers. *Pipelaying*, procuring fraudulent voters; when the Croton water was introduced into New York hundreds of men were brought from Philadelphia just before an election, ostensibly to lay water-pipes, but really to vote where they had no legal right to vote. *Pond*, a natural, in England an artificial, pool. *Railroad*, in England, "railway;" and *locomotive* for the English "engine." *Rapids*, river currents broken by shallows. *Reckon*, for "suppose" or "think;" as "I reckon that will do." *Reliable*, for trustworthy. *Ride*, either on a horse or in a vehicle; in England, restricted to horseback. *Rile* (English provincial roil), to stir up, to make angry. *Rooster*, cock, or male barnyard fowl. *Sick*, for any illness; the English usually restrict it to illness of stomach. *Skedaddle*, to run away. *Sleigh*, any sledge or vehicle on runners. *Span*, a pair, *Stage*, a stage-coach. *Stoop*, Dutch for the entrance to a house. *Store*, for a place where things are sold; the English generally say "shop." *Suspenders*, braces. *Suspicion*, occasionally used as a verb, to suspect. *Switch*, to change cars to another track; English "shunt." *Tavern*, where travelers are lodged; in England, where liquor is sold but travelers are not entertained. *Tickets*, we buy "way-tickets" or "through-tickets" on railroads, etc.; the Englishman is "looked." *Timber*, forest or grove. *Transient person*, one not remaining long in the place. *Venison*, the flesh of the deer; in England, wild meat in general. *Wagon*, or *wagon* as a verb, "the goods were wagoned over." *Will*, for "shall," to express an expectation. *Woods*, English a wood.

The following are some of the phrases common in the United States, of which many are acknowledged as "slang" and not in use by careful speakers. *Acknowledge the corn*, to admit or confess a thing. *All-fired*, great, excessive. *All-possessed*, acting as though possessed by an evil spirit. *Allow*, to concede. *Among the missing*, disappeared, run away. *Any how you can fix it*, meaning it is so and cannot be otherwise. *Appreciate*, to increase in value. *As good as*, for "as well as;" "I might as good as give up." *Backbone*, courage, moral or political. *Back down*, or *out*, or *take the back track*, or *back seat*; to submit to defeat. *Barking up the wrong tree*, operating in the wrong direction. *Beat*, to excel; "it beats all creation." *Blow*, gasconade. *Blower*, a braggart. *Blow out*, usually a festive entertainment. *Bogus*, counterfeit, bad, untrue. *Buck*, a male Indian or negro. *Brick in his hat*, tipsy. *Bust*, *busted*; failed, out of money. *On a bust*, getting drunk. *Caboodle*, the whole company or array. *Cahoot*, to go in partnership. *Can't come it*, you cannot deceive me. *Caps all*, or *caps the climax*, surpasses everything. *Carryings on*, wild or extravagant actions. *Care in*, for yield, or fail. *Chalk*, the right thing; "that's the chalk;" "you can't fool me, by a long chalk." *Chisel*, to cheat. *Choke off*, to stop one's operations. *Come around*, *come over*, to coax or to wheedle; "you can't come it over me." *Considerable*, in a great degree; "that's considerable of a yarn." *Coon*, a smart or cunning fellow; "he's a coon." *Corner*, to

get advantage of; "I cornered him." *Crowd*, any number of persons in a place or party; "he goes with the crowd." *Cut up*, cut up didoes, or shindies, frolicsome or mischievous acts. *Cut stick*, cut dirt, cut your lucky, to run away. *Cut a swath*, or a swell, or a big figure, to appear or act extravagantly. *Cut it too fat*, overdid it. *Death on a thing*, for superior in it; "he's death on billiards." *Desperate*, very; "I'm desperate glad you came." *Diggings*, for region; "in the diggings," here, or whereabouts. *Do*, or *Du*, tell, interrogations of surprise. *Done*, for did; "John done it." *Down upon*, opposed to; "I'm down on that like a thousand of brick." *Dreadful*, very or really; "he's dreadful good." *Driving*, for following a purpose; "what's he drivin' at?" *East*, for right; "that's about east." *Eating*, for to be eaten; "them's good eatin' apples." *Everlasting*, great, superior; "this is an everlasting big country." *Eye skinned*, watchful, cautious. *Face the music*, to meet the emergency. *Fair shake*, fair show, fair dealing, a fair chance. *Female*, misused for woman. *Fence*, on the fence, one undecided which party or side of a question to take. *Few*, somewhat; "I was scared a few." *Fire away*, go on. *Fix his flint*, to prevent one from doing a thing. *Fizzle*, a wretched failure. *Flash in the pan*, a failure. *Flat broke*, out of money. *Flat-footed*, extreme or unmistakable. *Fly off the handle*, to get excited. *Forehanded*, having money laid aside. *Fork over*, to pay up. *Freeze to*, ardently desiring, accepting, seizing. *Full chisel*, with all speed or force. *Funeral*, for concern; "it's none of our funeral." *Got his back up*, became angry. *Got the wrong pig by the ear*, or tail, accusing the wrong person. *Go-aheadativeness*, force, enterprise, efficiency. *Go for him*, to attack vigorously. *Goes with a looseness*, with a rush, goes his pile, or his death, goes the whole hog on it, working zealously for a purpose. *Gone under*, gone coon, gone goose, failed or dead. *Goose*, sound on the goose, to be depended upon, usually in a party sense. *Grass widow*, one separated from a husband who still lives. *Green*, unsophisticated; "he's a green horn," "as green as grass." *Grit*, courage or endurance. *Gum game*, trick, deception. *Gumption*, common sense. *Gush*, voluble talk; *gusher*, one who is profuse or ardent in words. *Hang of*, mastery of, understanding of; "he's got the hang of it." *Hang up the fiddle*, to go out of the business in hand. *Hard up*, out of money. *Heap*, a great amount; "there's a heap of folks at the meeting." *Heft*, weight. *High fulutin*, ornate, bombastic. *Hitch horses*, to join in partnership. *Honeyfugle*, to cajole or deceive. *Hook*, to steal. *Hookey*, applied to unauthorized absence from school. *Hook on his own*, by himself. *Hooter*, probably a mispronunciation of "iota," "I don't care a hooter." *Horn*, in a, "I believe it, in a horn," i.e., I don't believe it at all; the same as *over the left*. *Hoss*, a senseless vulgarism of personal address; "how are you, old hoss?" or "old hoss fly." *Hunk*, a large piece; "all hunky," all right; also "hunky dory." *Hurry up the cakes*, be quick. *Jam up*, complete. *Jesse*, give him, to thrash or overcome him. *Jig is up*, the affair or attempt is ended. *Jug full*, not by a, an expression of contemptuous doubt. *Keep the pot boiling*, keep at your business. *Keep company*, applied to "courting." *Kick up a row*, to raise a disturbance. *To kill*, extremely; "that cat runs to kill," or very fast. *Kind o', kind er*, as it were. *Kink*, a notion; "I've got a kink in my head." *Knocked into a cocked hat*, used up. *Knock down*, a rebuff; "that was a knock down for him." *Larrup*, flog. *Law sakes alive!* exclamation by old women, like "mercy sakes alive!" *Lay*, purpose or design; "what lay are you on now?" *Let on*, tell or disclose. *Let up*, release. *Lickety-split*, with all speed. *Lift*, or raise, his hair, scalp. *Like I do*, for "as I do." *Like a book*, right, regular, correct. *Little end of the horn*, to come out at the, to fail after a promising start. *Logrolling*; at first, the reciprocal aid of neighbors in gathering and piling logs; now, combinations of legislators and outsiders to procure the passage or defeat of laws. *Loggy*, heavy, stupid. *Looseness*, recklessness; "he goes it with a perfect looseness." *Love*, for like; "I love apple pie." *Make his mark*, succeed. *Make tracks*, run away. *Make a raise*, get money. *Middling well*, in moderately good health. *Mill*, "he has been through the mill," i.e., has had experience. *Mind your eye*, keep good watch. *Mind the baby*, take care of the child. *Missing*, among the, a runaway, particularly a debtor. *Monstrous*, for "very;" "she's monstrous pretty." *Mortal*, very; "its mortal hot." *Mosey*, run away. *Most* is used where "almost" should be. *Mourners*, crowding the, pressing hard upon the weak or unresisting. *Nary red* (not any red), not a cent. *Nip-and-tuck*, neck and neck; an even race. *No* (doubled); double negatives are common in ordinary conversation; as "that won't do, no how." *No sir-ree!* an emphatic negative. *Nothing else*, an emphatic affirmative; "will you wear your new bonnet to church?" "Well, I ain't goin' to wear nothin' else." *Off*, for from; "he's borrowed a quarter off me." *Off the handle*, or track; gone wrong. *One of 'em*, for a person well informed, active and self-possessed; same meaning as "he will do," "he can travel," "he'll pass." *On hand*, always ready. *Opinionated*, fixed in his sentiments, with a will of his own. *Overlaugh*, to defeat, usually in political action, and by crooked means. *Partay*, nearly; "his house was partly opposite mine." *Pesky*, very, extreme or troublesome. *Plaguy sight*, considerable. *Poky*, dull, stupid. *Powerful*, very; "she's powerful weak." *Predicate*, found upon. *Pretty considerable*, a large quantity. *Prospect*, look for land, or mines. *Proud*, glad; "I'm proud to see you." *Pull foot*, or heel; run off. *Pull up stakes*, move to another place. *Pull the wool over his eyes*, deceive a man. *Rag off the bush*, to take the, to excel. *Reckon*, think; "I reckon he will come." *Pull through*, succeed. *Rendition*, rendering. *Right away*, soon. *Rip out*, speak violently. *Rip-tearing mad*, very angry. *Rip-snorter*, thorough going. *Risky*, doubtful or danger-

ous. *Roorback*, a false political report. *Rouser*, superior; "he's a rouser." *Row up*, scold; "the old woman will give you a rowing up." *Row to hoe*, the work in hand. *Rub out*, deny; "there's no use of trying to rub it out." *Scallawag*, a good-for-nothing. *Scare up*, find. *Scoot*, run around or away. *Scrape*, difficulty; "I'm in a scrape." *Screamer*, superior; "that gal's a screamer." *Screw*, severe opposition; "I'll put the screws to him." *Serumptious*, fine, excellent. *Semi-occasionally*, once in a while. *Sense*, understand; "do you sense it?" *Shake*, in a brief period; "I'll be there in a brace of shakes." *Shake a stick at*, enumerate or estimate; "there are more claims than you can shake a stick at." *Shaky*, wavering, not to be depended upon. *Sharp stick*, urgent pursuit; "I am after him with a sharp stick." *Shaver*, a small boy. *Shinning around*, running around, usually to borrow money. *Shindy*, a fracas. *Shine*, conceit; "I'll take the shine out of him." *Shine*, boot-black's cry for "black your boots." *Shot in the neck*, drunken. *Shote*, a worthless fellow. *Shucks* (corn-husks usually thrown away), good for nothing; "he ain't worth shucks." *Sky*, throw; "he shied a brick at me." *Side-winder*, a heavy blow with the fist. *Sight*, a great many; "there was a sight of people." *Skeeziks*, a mean fellow; "there goes that old skeeziks." *Skunk*, utterly defeat. *Slang-wanger*, a noisy and reckless talker. *Slap jack*, a pan cake. *Slick*, easy; "slick as grease," or "as a whistle." *Slide*, let go; "let her slide." *Slope*, run away. *Slushing around*, bragging, bullying. *Small potatoes*, of little account; "he's small potatoes, and few in a hill." *Snag*, any obstruction. *Smart bit*, a chance, or sprinkle, considerable of anything. *Sneezed at*, not to be, not to be lightly considered. *Snoop*, snatch slyly in bits or trifles. *Snorter*, superior; "our congressman is a snorter." *Sockdolager* (vulgarism for doxology), a finishing blow. *Soft sawder*, or soap, flattery. *Some*, excellent; "he's some on figures." *Some punkins*, smart. *Spark*, "court" a girl; a spark, a lover, or sweetheart. *Spell*, a period of time; "there's been quite a spell of rain." *To spell*, to relieve; "take my spell at the wheel." *Splurge*, swaggering demonstration. *Spread*, do one's best; "he has just spread himself on that question." *Sprouts*, experience, usually punitive and unpleasant; "we'll put you through a course of sprouts." *Square*, even with; "I'll get square with you;" "he's on the square," or "all right;" sound, honest, dealing fairly. *Squatter*, one occupying land or a place to which he has no legal right. *Stag dance*, or party, a company of men only. *Stall*, stick fast; "the oxen got stalled in the mud." *Stand up to the rack*, fodder or no fodder, risk the consequences; equivalent to "face the music." *Staver*, an efficient man, one who "rushes things." *Steep*, exaggerated; "oh! that's too steep." *Straight out*, or straight as a loon's leg, undeviating in purpose or action. *Strapped*, having no money. *Streaked*, feeling uncertain, or frightened. *String on a*, in a trap or under management; "I've got him on a string." *Stuff*, hoax; "you can't stuff me with that." *Stump*, to challenge or dare; or make public political addresses (formerly in the west delivered from the stump of a tree); "he stumped his district." *Sucker*, a vagabond, or one who lives on others. *Swad*, many; "there's a swad of boys over there." *Swan*, for "swear." *Swap*, exchange. *Taken to do*, called to account. *Take back*, recant. *Take the rag off*, or shine or conceit out of, overcome, or humiliate. *Tall*, immense; "that's a tall yarn." *Taps*, firm standing; "he's on his taps." *Thundering*, exceedingly great; "he's doing a thundering business." *Too thin*, not to be believed. *Tie to*, confide in; "he'll do to tie to." *Tight place*, or squeeze, trouble or difficulty. *To*, at; "he's down to Salem." *Top notch*, highest excellence. *Tote*, carry, or the thing carried; "the whole tote," or all of it. *Truck*, merchandise, particularly vegetables; "garden truck." *Tuckered out*, tired. *Ugly*, ill-tempered. *Up to the hub*, to the full extent. *Up to snuff*, not to be deceived. *Woke up the wrong passenger*, made a dangerous mistake in attack. *Walk chalk*, depart at once. *Walking papers*, discharge from office or employment. *Walk into*, attack, dispose of; "he walked into the edibles," he ate eagerly; or as a threat; "I'll walk into your mutton," i.e., chastise you. *Want to know*, exclamation of surprise or curiosity. *Ways*, no two, no alternative; "no two ways about," it must be so, is so. *Whale*, thrash. *Wheel-horse*, a man who does the heavy work. *Whittle*, cut with a knife. *Whole cloth*, out of, entire, complete; "a lie out of whole cloth." *Whole team*, strong; "he's a whole team, and a horse to spare," he is sufficient to the undertaking. *Wilted*, backed down. *Wipe out*, exterminate. *Worst kind*, excessively; "I'm hungry the worst kind." *Wrathy*, angry, offended.

AMERICAN JOURNALISM is too important to be passed over without especial notice. If in England the press can claim to be "the fourth estate," it is at least second in point of power and influence in the United States, where the only superior power is the people themselves. There are published in the United States and Territories at this time (Jan., 1880) nearly 9000 newspapers and magazines, scattering their issues like an incessant fall of snow over every city, village, and farm from the St. Lawrence to the gulf, and from the Atlantic to the Pacific. About 800 of these are issued daily except Sundays (many of them on that day also); 60 are issued three times a week, 120 twice a week, nearly 7000 once a week, 40 once in two weeks, 90 semi-annually, 17 once in two months, and between 50 and 60 quarterly. The extremes of circulation vary widely. Some daily newspapers print 120,000 copies every day in the week except Sunday, and others print less than 1000. Certain weeklies have reached the enormous edition of a quarter of a million, and others print but a few hundreds. But

the aggregate circulation of serial printed matter in the United States is immensely greater in variety, in extent, and in ratio to population, than in any other country. Of native-born whites the proportion of such as cannot read is insignificant; and the universal reading of newspapers is one of the peculiarities that first strikes the attention of a stranger. Free and unabashed as the air, the newspaper penetrates every nook and corner, circulates in every office and warehouse, in every parlor and hovel, in the hotel and the railway car, in the prison and the church. In 1870, according to the best authority, there were 5871 newspapers and periodicals in the United States, and 7642 in all the world besides. We had, therefore, one newspaper to every 6525 inhabitants; leaving to the world outside an average of one periodical for every 200,000 inhabitants. In Hudson's *History of Journalism* it is estimated that the number of copies of newspapers printed in Great Britain in 1870 was 350,000, and the same in France. The census returns show that over 1,500,000,000 copies were issued in the United States in the same year. That is to say, for every printed sheet in Great Britain, or France, there were more than four printed sheets in the United States. This ratio is doubtless greater to-day, for the increase of newspapers has been such in this country as to warrant the claim that the number of all journals is about the same as in all the world besides, while the aggregate circulation is at least one third more in the United States. The census to be taken this year (1880) will probably show one newspaper to about 5000 of our population.

And yet journalism in the United States is comparatively of modern growth. The oldest newspaper in English is the *London Gazette*, begun in Nov., 1665. The oldest living newspaper, the *Frankfort Gazette*, started in 1615. The oldest in the United States is the *New Hampshire Gazette*, started in Oct., 1756; so that our journalism is only in its 125th year, while that of England is 90 years older. But the very first newspaper in this country was *Publick Occurrences*, issued in Boston, Sept. 25, 1690, by Richard Pearce for Benjamin Harris, and immediately suppressed by the government. Then came, April 20, 1704, the *Boston News-Letter*. In 1719 appeared in Boston the *Gazette*, and in Philadelphia the same year the *American Mercury*. In 1721 James Franklin started the *Boston Courant*, which lived under the care of Benjamin Franklin about six years. The *New York Gazette* started in 1725; the *Annapolis (Md.) Gazette* in 1727; the *Charleston (S. C.) Gazette* in 1731; the *Williamsburg (Va.) Gazette* in 1736. In his *History of Journalism* Hudson considers the subject by "eras." Within the first era, 1690-1704, the only noteworthy event, after the prompt suppression of the *Publick Occurrences*, happened in New York, where Benjamin Fletcher, then lieutenant-governor of the colony, having induced William Bradford, a printer of Philadelphia, to quit that city and set up in New York, caused the reprinting, in 1696, of a copy of the *London Gazette*, which contained an account of an engagement with the French not long before the peace of Ryswick. That was the only victory of types over official red tape in the 14 years following the suppression of the *Publick Occurrences*. However, news was circulated, much as it was in ancient Rome, in written and printed letters, circulars and hand-bills; and theological and political battles were fought in pamphlets, acknowledged or anonymous, the favorite weapon of the Mathers and other disputants of the time.

In the second "era," from 1704 to 1748, the American press made a decided start. On the 24th of April, 1704, John Campbell, of Boston, issued the first number of the *Boston News-Letter*. This is usually referred to as the first American newspaper, and indeed so it was, for it lived through many vicissitudes 72 years, up to the dawning of the revolution. In 1719 Campbell was superseded as postmaster by William Brooker, who followed Campbell's example by starting a paper, the *Boston Gazette*, the second American newspaper; and then began newspaper quarrels, a feature of journalism still far too prominent. Campbell resented his removal from office, and the fight was hot and personal. The day after the starting of the *Gazette* in Boston, Andrew Bradford issued in Philadelphia the *American Weekly Mercury*, Dec. 2, 1719. He also was a postmaster; so the post-office and the press appear to have been early united in this country, and the union has never been broken. In later years three notable editors, Benjamin Franklin, Amos Kendall, and John M. Niles became postmasters-general; and an ex-editor is now postmaster of New York. Bradford died in 1742, and the paper was continued by his widow. On the 7th of Aug., 1721, the two Franklins—James and Benjamin—issued the first number of the *New England Courant*. Wars and contentions between journalists now increased, but the Franklins were too strong for their jealous opponents, one of whom, ex-postmaster Campbell, sold his *News-Letter* to Bartholomew Green, and became a justice of the peace. Newspaper warfare, however, though conspicuously violent in America, is a true British inheritance; for a century before Ben. Franklin's caustic pen was sharpened the writer of one London newspaper, referring to two of his contemporaries, said: "I have discovered the lies, forgeries, insolences, impieties, profanities, blasphemies of the two sheets."

American journalism was now fairly established. The *New York Gazette* was begun by William Bradford in Oct., 1725; the *New England Weekly Journal*, the fourth Boston newspaper, in 1727; the *Maryland Gazette* at Annapolis in 1727; Benjamin Franklin's *Universal Instructor in all the Arts and Sciences*, and *Pennsylvania Gazette* in Philadelphia in 1728; the *Weekly Rehearsal* in Boston in 1731, became the *Boston Evening Post* in 1735, and died of loyalty to the king in 1775; the *New York Weekly Journal*, Nov. 5, 1733, by John Peter Zenger, whose imprisonment for libel on the government,

prosecution, trial, and acquittal through the efforts of Andrew Hamilton, the leader of the Pennsylvania bar, marked the first great triumph of the freedom of speech and of the press that is now one of the great foundation stones of our temple of liberty. The *Weekly Post Boy*, another New York paper, was speedily absorbed by Bradford's *Gazette*, Sept. 27, 1732; the *Rhode Island Gazette* was begun at Newport by James Franklin, but it lived only three months, and Franklin himself died in 1735. About the same time the printing press, the invention that long afterwards gave the south so much annoyance, began to invade that section. The *South Carolina Gazette* was begun in Charleston, Jan. 8, 1731; the *Virginia Gazette* at Williamsburg in 1736. Both these papers died young on the death of their proprietors, and both were resuscitated soon afterwards. Returning north we find the *Boston Weekly Post Boy* begun in 1734, by the old postmaster, Ellis Huske, who recommended the passage of the stamp act. In 1742, William Bradford, grandson of the New York printer, started the *Pennsylvania Journal and Weekly Advertiser*, one of the earliest and most vigorous supporters of colonial freedom. On the day before the odious stamp act was to go into effect the *Journal* inclosed its pages in black lines, and placed over its title the picture of a skull and cross-bones, with the legend "Expiring; in hope of a resurrection to life again;" with elsewhere, "Adieu, adieu, to the liberty of the press! Farewell liberty!" and as an epitaph, "The last remains of the *Pennsylvania Journal*, which departed this life the 31st of Oct., 1765, of a stamp in her vitals; aged 23 years." The paper, however, was not actually suspended. The *Maryland Gazette*, which had been suspended in 1736, was revived in 1745. A newspaper in the German language was issued at Germantown, Penn., in 1739, and another in Philadelphia in 1743. The last paper started in the colonial period was the *New York Evening Post*, begun in 1746, but it lived only about a year.

About the middle of the century the political heavens began to show signs of the coming revolution. Naturally, the cities where newspapers were issued became centers of political agitation. Though few in number, they were important in influence. In 1748 journals were issued in Boston, New York, Philadelphia, Annapolis, Williamsburg, and Charleston; only six places in all America that could boast of newspapers. In the same year Samuel Adams established in Boston the *Independent Advertiser*, an organ of the more ardent of those who were anxious to become "rebels." Then came the *New York Mercury*, begun by Hugh Gaine, Aug. 3, 1752. In 1753 the *Boston Gazette, or Weekly Advertiser*, appeared and lived until killed by the stamp act. The voices of freedom were growing in number and boldness; the Adamses, Otises, Warrens, Mayhews, Quipys, and others, filled newspapers and pamphlets with demands and arguments for freedom from England. The real organ of the New England patriots appeared April 7, 1755—the *Boston Gazette and Country Gentleman*. On the first day of the same year the *Connecticut Gazette* was begun at New Haven. The *Boston Gazette*, however, was the mouthpiece of the men who created the revolution; but it was not much of a "newspaper" in comparison with those of our day. It had two pages only, on half a sheet of crown paper—about the size of a single leaf from an ordinary ledger. While the British troops occupied Boston the *Gazette* was issued in Watertown, but returned to Boston after the troops left. The next new issue was the *North Carolina Gazette*, begun at Newbern, Dec., 1755. Then came the *New Hampshire Gazette*, Oct. 7, 1756—the oldest American living journal, having been published without intermission and without a radical change of name to the present time. Other papers appeared as follows: *Boston Weekly Advertiser*, Aug. 22, 1757; *South Carolina and American General Gazette*, 1758; *Newport (R. I.) Mercury*, June 12, 1758, still living; the *New London Summary*, Aug. 8, 1758; another *New York Gazette*, Feb. 16, 1759; the *Wilmington (Del.) Courant*, 1761; the *Providence (R. I.) Gazette and County Journal*, 1762; the *Georgia Gazette*, Savannah, April 17, 1763; and the *New London Gazette*, afterwards the *Connecticut Gazette*, Nov. 1, 1763. The *Connecticut Courant* was begun at Hartford Nov. 19, 1764, and still lives; the *Cape Fear Gazette and Wilmington Advertiser* was begun in 1763; the *Portsmouth (N. H.) Mercury and Weekly Advertiser*, 1765; the *Maryland Gazette*, 1765; the *Gazette and Country Journal* at Charleston, 1765; the *Constitutional Courant*, Burlington, N. J., 1765 (one issue only); the *Virginia Gazette*, 1766, the first newspaper to publish, ten years later, the full copy of the declaration of independence. At the commencement of the revolution there were seven newspapers published in New England, four in New York, and two in Virginia. One of the most important of the revolutionary newspapers was the *New York Journal, or General Advertiser*, started May 29, 1767, by John Holt, under the auspices of George Clinton and Philip Schuyler, two prominent patriot leaders. When the British took possession of New York, the *Journal* was removed to Kingston, and thence to Poughkeepsie. The British were not without a voice amid all this array of revolutionary prints. Their organ in New York was the *Royal Gazetteer*, better known as *Rivington's Gazette*, from the proprietor, James Rivington, who enjoyed the distinction of several mobbings by the "Sons of Liberty" and other mysterious organizations. In Boston the royalist paper was the *Chronicle*, the proprietors of which—Mein & Fleming—received similar treatment. This paper died in 1770 for want of patronage, but Rivington's paper lived until the war was over, then pretended to be converted, but was not trusted, and soon died. One of Rivington's best contributors was Major André. In 1767 appeared the *Pennsylvania Chronicle*; in 1768, at Salem, Mass., the *Essex*

*Gazette*, now the *Salem Gazette*; also the *New York Chronicle*, short lived; and Oct. 13, 1769, the *Cape Fear Mercury*, at Wilmington, N. C.

It is unnecessary to mention every newspaper of those times. A few were especially conspicuous, such as the *Massachusetts Spy*, established by Isaac Thomas. The 49 newspapers established in the colonies from 1748 to the peace of 1783 were weekly or semi-weekly issues. Between 1690 and 1783, 67 newspapers have been started, but 43 only were living when peace was concluded.

With peace and independence came an entire revolution in the spirit of the press. Journals which lately had fought side by side, soon ranged in opposing and hostile fleets, as the leaders and organs of contending parties, of which the chief were the federalist and the republican, the latter soon changing into the democratic party. We have only to say of this period—1783 to 1812—that in the early portion the virulence of partisanship, the shocking language used by the press in political warfare, would be scarcely believed if we had space to quote it. Even Washington, who came from Yorktown like a demigod, received more wicked and vile abuse than would now be given to an abandoned felon. This bitterness was conspicuous during and after his second term, extended through Adams' administration and Jefferson's two terms, and was mollified only for a time by the war with England. After that war the democratic press preached a crusade against "blue-light federalists," and bad language flowed anew until the re-election of Monroe without opposition brought in the "era of good feeling" and a general suspension of hostilities. Among the leading journals and journalists of this period were many of the papers aboved named that lived through the revolution; the *Journal and Argus*, in New York, by Thomas Greenleaf; the *American Citizen*, by James Cheetham; the *Evening Post*, now the *New York Evening Post*, by William Coleman; the *New York Packet*, by Samuel Loudon; the *Massachusetts Spy*, by Isaiah Thomas; the *Massachusetts Centinel*, afterwards the *Columbian Centinel*, by Benjamin Russell; the *Philadelphia Aurora*, by Benjamin Franklin Bache, etc. One of the severest word-battles was over the alien and sedition laws, in which the liberty of the press was, or seemed to be, seriously threatened.

The first daily newspaper in the United States was the *American Daily Advertiser*, issued in Philadelphia in 1784—now the *North American*. Next year came the *New York Daily Advertiser*, for some time edited by the poet Freneau. The *Independent Journal*, published in New York, was the paper through which Hamilton, Madison, and Jay gave the world the remarkable articles now collectively known as *The Federalist*. As our western country became settled, the press followed closely the pioneer, as in later days—during the building of the Pacific railroad—the peripatetic office of the *Frontier Index* kept just ahead of the rails and the locomotive. In 1786 the *Pittsburgh (Pa.) Gazette* was begun, and still lives; and so we might follow the press directly onward to the shores of the Pacific. The combinations of papers with each other have been infinite; but a single instance will illustrate—that of the *Philadelphia North American*, in which are united ten different journals, viz.: the *Pennsylvania Packet*, established in 1771; the *American Daily Advertiser*, 1784; the *Gazette of the United States*, 1789; the *Evening Advertiser*, 1793; the *United States Gazette*, 1804; the *True American*, 1820; the *Commercial Chronicle*, 1820; the *Union*, 1820; the *North American*, 1839; and the *Commercial Herald*, 1840. What mixtures of political principles must have been taken down in those nine swallows! Returning to daily newspapers, we remark that of many hundred daily and other newspapers started in New York city alone from the commencement of Bradford's *Gazette* in 1735 to the year 1827, only two are living—the *Commercial Advertiser* and the *Evening Post*. Death, it is said, loves a shining mark, and journalism appears to have given his arrows abundant opportunity. No other field of intellectual or pecuniary enterprise is at once so attractive and so dangerous. It would occupy nearly the whole of one of the eight-page journals of to-day to print merely the names of newspapers that have started since 1690 only to fade like rootless plants under a fervid sun.

Enough has been given to convey an idea of the early history of journalism in the colonies and the United States. But the history of "newspapers" as such does not commence until about 1820. Before and during the revolution the ambition of journalism was to crystallize public opinion. The news printed was chiefly from foreign countries. It is true, the first sheet was entitled *Publick Occurrences*, but its small installment of domestic news so filled with surprise the powers that were, that they immediately suppressed the daring innovation. Thenceforth the greater portion of journals was occupied with discussion, and news was hardly so much as a secondary consideration. Their columns were filled with dissertations on every possible subject save the things at the time most deserving of notice. The price of newspapers was high and their circulation limited. Indeed, it was not until the introduction of rotary presses that any considerable circulation could be "worked off." Ben. Franklin was content with the old Ramage press, a clumsy wooden construction that required a separate "pull" for every page, whose utmost capacity would scarcely produce a hundred perfected sheets in an hour. If his soul could look out through the dull eyes of his statue in Printing-house square, how it would glow with astonishment to see under the street beneath his feet 20,000 newspapers, each one as large as ten of his, printed, cut, and folded in that same space of an hour. Soon after 1830 there was started in New York a paper which was sold for one cent—a daring innovation indeed, when the common price was sixpence. It was spe-

cially devoted to local as well as general news, and speedily attained a circulation that, for the period, was phenomenal. This was *The Sun*, the pioneer of the penny press. In 1835 it was followed by *The Herald*, also a one-cent paper, which went on from prosperity to prosperity until it stands to-day among the few great newspapers in the world. *The Tribune*, also a one-cent paper at the time, was started in 1841 by Horace Greeley, and is now in many respects without a rival. The cognate ideas of home news and low prices revolutionized journalism. The mammoth sheets of the past were distanced and defeated, and by degrees the greater portion of them paid more attention to news and less to discussion, and in many instances greatly reduced their prices. We then had real newspapers, and the getting of the news became the publisher's first aim. Expresses were established on steamboats and railways, and where these were lacking, news came by "pony express," or any other available means. Carrier-pigeons were tried, but they did not succeed. Boats ventured far out to sea to intercept incoming ships; special correspondents were sent to various points, and in one instance a fast-sailing pilot-boat was sent across the Atlantic. Competition became so intense and the expense so great that neighboring journals combined to share the costs and the benefits. So arose the harbor-news association, and a little later the associated press. The latter association, which now spreads its news-gathering net over all the habitable earth, was a necessary result of the introduction of the magnetic telegraph. That invention annihilated space, and made competition by horses or steam impossible. At first we had fifty words or so "by telegraph" from Washington, at a round price. To-day we have column upon column every morning by the same wonderful conveyance from every state and territory of our country, from all the nations of Europe and Asia; literally "from Greenland's icy mountains to India's coral strand."

Having the news, the next question was how to circulate it. Here the inventive genius of America came to the publisher's relief, first in Hoe's steam rotary press, of from two to ten cylinders, which might throw off 10,000 papers in an hour. Then came the perfecting press, printing both sides at once from a continuous roll of white paper and cutting off each paper at the proper point. Still later came the most important of all: the stereotyping of the original type-pages and the production of one or a hundred casts, as might be desired, and that, too, in a space of time not exceeding 15 minutes for a page of stereotype. The problem of circulation was thus settled. It is now merely a question of how many presses are run; for with enough of them a daily newspaper could as well print on a morning before sunrise half a million as half a hundred thousand. The result of these and other inventions is, that where Franklin could produce in an hour 100 sheets of four small pages, to be afterwards slowly folded by hand, the modern press will produce 15,000 to 20,000 sheets of eight, twelve, or sixteen pages—each page as large as the whole of Franklin's paper, beautifully printed, the pages cut, sometimes the backs pasted together, and all folded and ready for mailing or delivery, in the equivalent 60 minutes. The capacity of newspaper production is practically unlimited, and circulation is henceforth to be determined only by demand.

We lack space to follow the course of journalism closely through its hundred battles since the war of 1812. How the partisans raved over the first defeat of gen. Jackson in 1824; the incipient rebellion in South Carolina; Jackson's war with the United States bank; the furious anti-masonic crusade; the tremendous financial disasters of 1837, which overthrew the Democratic party; the gallant but futile struggles of Henry Clay; the war of tariff and free-trade, "still beginning, never ending;" the native American campaign; the annexation of Texas; the Mexican war; the contest of the north and south, that found an ending which was not an end in the compromise measures; the California annexation and the gold craze; the Kansas struggle; the death of the whig; the birth of the republican, and the division of the democratic party; the election of Lincoln; the dreadful struggle with the rebellion; the triumph of the union; the dark days of commercial distress—all these are in the history of journalism, but so vividly remembered that further reference is quite unnecessary.

Of the men who have been conspicuous in connection with American journalism, we cannot pretend to give a catalogue. Before and during the revolution, and down to the second war with England, nearly all public men of importance spoke through the press. In the newspapers were heard James Otis, Samuel Adams, Joseph Warren, John Hancock, Jonathan Mayhew, and scores of their brethren. Jefferson, Madison, Burr, Hamilton, Clinton, Jay, and scores of other politicians were heard in the same manner. Benjamin Franklin, and Noah Webster, and Charles Carroll, of Carrollton, were early in the long line of "able editors." William Cobbett created a sensation in Philadelphia with his *Porcupine*; and James Cheetham, and William Duane, and William Coleman were eminent in this field. In the later time we find such names as Seba Smith, Jr., the original "Major Jack Downing;" Francis Hall, William L. Stone, John Inman and Robert C. Sands of the New York *Commercial Advertiser*; Mordecai M. Noah, Nathaniel Willis, grandfather of the poet; William D. Gallagher, William Schouler, Richard Haughton, Samuel Medary, Charles C. Hazewell, Samuel S. Cox, John B. McCullough, Joseph Medill, Horace White, Wilbur F. Storey, William Cullen Bryant, James Watson Webb, Horace Greeley, James Gordon Bennett, Henry J. Raymond, Manton Marble, James and Erastus Brooks, Charles King, William Leggett, John Bigelow, Thurlow Weed, Edwin Crosswell, Redwood Fisher, Joseph Gales, Hezekiah Niles, Francis P. Blair, Duff Green,

William W. Seaton, John Rives, Amos Kendall, Thomas Ritchie, George D. Prentice, George W. Kendall, Don Piatt, Frederick Douglass, Solomon Southwick, John H. Pleasants, Isaac Hill, William Cassidy, Henry Wheaton, Moses Y. Beach, Sidney E. Morse, Henry W. Bellows, Henry M. Field, Henry Ward Beecher, Gulian C. Verplanck; George P. Morris, Nathaniel P. Willis, Park Benjamin, Henry B. Anthony, Whitelaw Reid, William Sprague, George Wm. Curtis, Josiah G. Holland, William D. Howells, George H. Andrews, David Hale, Gerard Hallock, William C. Prime, David M. Stone, William W. Clapp, Joseph T. Buckingham, Theophilus Parsons, George Lunt, William Lloyd Garrison, John Neal, Samuel Bowles, John S. Sleeper, E. C. Bailey, R. Barnwell Rhett, Rufus Dawes, John Forsyth, George W. Childs, John W. Forney, William M. Swain, Russel Jarvis, Willis Hall, Charles A. Dana, Sidney Howard Gay, Oliver Johnson, John Russell Young, William G. Brownlow, Murat Halsted, Henry Watterson, Richard Smith, George Dawson, Thomas Kinsella, Jonas M. Bundy, Hugh Hastings, Charles E. Smith, and three times as many more quite as deserving of mention.

Of the influence of this aggregation of intellect upon the country we set forth no opinion. It is certain that the once almost despised journalist who took cord-wood and garden-truck in pay for his 7 by 9 sheet, has risen to the highest social and political position. While about the last class of citizens who are willing to do as they ask others to do—assume office and discharge its duties—not a few of them have been chosen to such duties by the people. No professional journalist has yet been president of the United States, but one has been vice-president; a few have been governors of states; a large number have been United States senators and members of congress; some of them have been ministers to foreign countries, and several have declined that honor. One is now a cabinet officer. In the 41st congress there were 8 editors in the senate and 26 in the house, the speaker being one of them. In the succeeding congresses the numbers have been about the same. The proportions in most of the state legislatures are considerably larger.

Some of the prominent features of modern journalism, besides the dominant idea of the news and all the news, are the fullness of reports of matters of public importance. When the news of the great battle of Waterloo reached London, the *Times* told the story in less than half a column. Such an event to-day would occupy twenty or thirty columns. The resources of journalism were well exemplified in our rebellion, when "extras" were issued almost hourly on important occasions, and the press was constantly in motion. Modern reporting is nearly perfect; but that does not satisfy the newspapers, and it has been supplemented by a system of endless and minute inquiry known as "interviewing," whereby all men who are suspected of knowing anything of any particular matter are visited by reporters and questioned and cross-questioned until the last item of information has been extracted; and this not only in matters of fact but in matters of opinion. Journalism compels the world to stand and testify on every conceivable topic that may, in the journalist's opinion, interest the reader. Add to this searching inquiry the inevitable editorial comment, and it must appear that the research and the combinations of facts, opinions, and speculations thereon by modern journalism are as complete and as exhaustive, though not as guarded, as the most formal and satisfactory trial in a court of justice. This "interview" is a kind of moral rack on which any man may be stretched without a moment's warning. Whether its results are good or bad, we leave others to judge.

A country that admits into citizenship all people and all nations must naturally produce a polyglot press. The English language is our lawful inheritance; French or Spanish were bought, or annexed; German, the Scandinavian tongues and some others came with immigration; and Indian languages are indigenous. At the beginning of 1880, there were of journalistic publications in the United States, besides English, about 320 German; 35 French; 25 Spanish; 25 Norwegian, Danish, and Swedish; 10 Bohemian; 10 Hollandish; 5 Welsh; 2 Portuguese; 2 Polish; 1 Hebrew, 1 Cherokee, and 1 Choctaw; and, we believe, a journal in raised letters for the blind, making 16 or 17 different languages, to which may be added old Irish, or Erse, to which some journals devote a portion of their space.

The burden of the press in such a land is naturally political; and a great majority of the newspapers are committed to one or another party; a few claim to be independent, but absolute independence of parties is a difficult position to maintain, and the only really independent journals, politically speaking, are those and those only which never meddle with politics, parties, or candidates at all. Next to political journals, in number and importance, are those devoted to religious or sectarian interests. Of these there are in the United States about 450, and many of them have very extensive circulation. Every sect amounting to a "denomination," except the Shakers, has its voice in journalism. The city of New York may serve as a sample of the whole country. There are issued in that city about 50 religious or sectarian journals and magazines; of these 9 are Roman Catholic, 8 Union Evangelical, 7 Protestant Episcopal, 3 Baptist, 3 Methodist, 3 Jewish, 2 Presbyterian, 2 Congregational—or Union under Congregational management, 2 Dutch Reformed, one each for the Disciples, Swedenborgians, Lutherans, and Unitarians; 4 "non-sectarian," and 1 freethinker. Religious journalism, now of great extent and importance, is of recent origin, dating back only to the beginning of 1816, when the *Boston Recorder* was started, with Sidney E. Morse as editor. The *Recorder* was long

ago merged in *The Congregationalist*. *The Christian Watchman*, now *The Watchman and Reflector*, also of Boston, was started in 1819 by Baptists; the *New York Observer* (Presbyterian) in 1820 by Morse, who had left the *Recorder*, and one of his brothers; *Zion's Herald* (Methodist) in Boston about the same time; the *Christian Register* (Unitarian), 1821; the *Christian Intelligencer* (Dutch Reformed), 1830; the *Evangelist* (Presbyterian) in 1833; the *Christian Advocate and Journal* (Methodist Episcopal), by the M. E. Book Concern in New York, about 1835.

Illustrated journals have in late years greatly improved, and in some notable instances, such as Harper's *Journal of Civilization*, have taken the front rank in perfection of artistic workmanship and in extent of circulation. Others are the *Christian Weekly*, *Frank Leslie's Illustrated Newspaper*, and among magazines the monthlies issued by Appleton, Scribner, and the Harpers. Distinctive comic journalism has never flourished for any considerable time, though at present it is fairly under way. A hundred *Punches* have been born, but very few lived to celebrate an anniversary of their natal day. Business and trade have a strong showing among journals, there being scarcely a calling of any importance that has not from one to a dozen typographic mouthpieces. There are hundreds of journals devoted exclusively to finance and commerce in general. Special branches have their organs: as banking, life, fire, marine, and accident insurance, real estate, mining, railways, milling, engineering, building, upholstery, lumbering, prices-current, mechanics in general, glass, crockery, iron, leather, boots and shoes, tobacco, cotton, gas, wines and liquors, telegraphing, brewing, chemistry, microscopy, photography, photography, bricks and pottery, carpet trade, drugs, harness, carriages, watches and clocks, car-building, plumbing, sewing-machines, publishing, printing, etc. Journals are devoted to legal affairs, to sports and games, to art and music, to the fashions, to the army and navy, militia, etc. Agriculture and horticulture engage the attention of more than a hundred journals and magazines; medicine and surgery of about seventy; affairs concerning colleges, schools, and education generally, of more than a hundred; about forty are intended for children and youth; masonic and other secret societies have their organs: indeed, it would be difficult to find any business, association, or prominent enterprise that has not its journalistic means of communication with the world. In all this maze of purposes one business is never overlooked—that of criticism. Every interest, business, profession, party, sect, searchingly criticises every other purpose, act, person, and thing. Not only the regular literary and critical publications, but every news, political, and trade journal considers criticism among the first and most important of its functions. Unrestrained by any other will than his own, every writer is free to arraign, try, convict, and condemn everybody else—and it must be admitted that the privilege is most literally and liberally used. See JOURNALISM ILLUSTRATED; and HUMOROUS.

**AMERICAN LITERATURE.** That the earliest literature of the part of America now comprising the United States should be distinctly English was inevitable. This was the case until near the close of the 17th c., when the vigorous and prolific Increase Mather came before the world with his theological works, numbering 85 in all. Mather was the first native writer of any considerable fame. He was the son of Richard Mather, a sturdy nonconformist divine, who came here in 1636, and was soon afterwards the pastor of a church in Dorchester, Mass., where Increase was born in 1639. The father lived to be 86 years old, and was in the ministry 66 years. But father and son were eclipsed by the more prolific and more famous son of Increase, Cotton Mather, the author of *Magnalia Christi Americana*, or *Ecclesiastical History of New England from its First Planting in the year 1620 unto the year of our Lord 1698*. He was an early and late believer in the reality of witchcraft, and opposer of it as a work of Satan; a theologian of the strictest Puritan type; an uncompromising defender of the religion of the day; while for fecundity he rivaled the most famous of the authors of England. An incomplete catalogue of his works numbers 382 separate publications, and there remain six great folio volumes of closely written MSS. that no one has had courage to print, and few have had courage to read. He was b. in Boston, Feb. 12, 1663, and d. Feb. 13, 1728; was a graduate of Harvard college, and used his pen not only for religion and against Satan and the witches, but as an early advocate of temperance; he wrote and preached for seamen, instructed negroes, set an example of abolishing flogging in schools by substituting moral suasion in his own family, and wrote extensively upon historical subjects. He was named after John Cotton, another voluminous theological controvertist, whose daughter was Cotton Mather's mother, but John Cotton was English-born and 48 years old when he came to America. He was noted for using the long and quaint title then in vogue among writers of religious tracts and books.

The earliest literary work in the English language in the colonies was a translation of Ovid's *Metamorphoses*, made in Virginia by George Sandys, the treasurer of the Virginia company. It was written in the earliest years of the settlement, probably begun in 1607, and printed in London in 1626. In coming before the public Sandys was anticipated by capt. John Smith, who published in 1608 an account of the new colony; in 1612 a map of Virginia and description of the country; in 1616 a description of New England; and in 1620 *New England's Trials*.

The foundation of the literature of a new world was laid on the 28th of Oct., 1636, when the general court at Boston voted £400 toward a school or college. Two years

later John Harvard, an English clergyman of superior education, who had been scarcely a year in the colony, gave twice as much money and a library of 320 volumes—a great collection for those times—in aid of the “school or college.” Thus began Harvard college, at Cambridge, Mass., of which Increase Mather was the first native president. Around this venerable institution and its co-laborers, William and Mary, and Yale, and, later, Princeton and Columbia, cluster the names and the works that created American literature.

There are many curiosities that mark the early period, such as the *Bay Psalm Book*, the first volume of importance printed in the colonies, Cambridge, 1640. In this curious work the struggle between literal translation and what we should now call respectable English was disastrous only to the language. The reading of some of the psalms in church to-day would provoke laughter fit for a comedy theatre. Another curious work was *The Simple Cobbler of Agawam in America*, etc., printed in London in 1646. The author was Nathaniel Ward, pastor of a church at Ipswich. His work was a caustic review of English state, church, and social affairs, with occasional hits nearer home. Other English-American writers before the Mathers were Thomas Hooper, the theologian; John Winthrop, first governor of Massachusetts, who wrote tolerable verses; William Bradford, also governor and versifier; Roger Williams, the champion of toleration and founder of Rhode Island and the Providence plantations; John Eliot, the “apostle to the Indians,” who translated the Bible into the language of the native tribes; Anne Bradstreet, author of the first volume of poems published in New England (daughter of Thomas Dudley, the second governor of the Massachusetts colony); Peter Folger (maternal grandfather of Benjamin Franklin), who wrote in clumsy rhyme *A Looking Glass for the Times, or the Former Spirit of New England revived in this Generation*; Michael Wigglesworth, theologian, author of quaint religious verse. Then came the Mathers, father, son, and grandson, where indeed “the last shall be first,” under whose shadows march in dim eclipse a host of miscellaneous writers. The first name that stands forth on the list is that of Cadwallader Colden, quite out of the New England pale, a native of Scotland and a resident of the colony of New York, who left an excellent *History of the Five Indian Nations*, and some works on scientific subjects.

Entering the 18th c., we come at once upon a name that towers high above all preceding, and in metaphysics and religious criticism above nearly all following American names, the last and greatest of the Puritan apostles, the Boanerges of Calvinism, Jonathan Edwards, only son in a family of fourteen children, whose influence still permeates New England, where his life was spent, and whose name is treasured in the college of New Jersey, over which he presided for the last few months of his life. This is not the place to record his history. His influence was not confined to this country, but was long a living power in all English theology. Edwards has been called by some admirer “the first man of the world during the second quarter of the 18th century.” His style, though not always lucid, is vigorous; his eloquence was fervid, and his life modest and simple. Ten large volumes comprised his share of American literature. The most famous of his works is known as *Edwards on the Will*. A singular event will illustrate both his modesty and his power: Once when Whitfield, the wonderful preacher, failed to appear as appointed, Edwards, a young man almost unknown in person to the public, took the place of the expected orator. He naturally thought that many of the audience would leave, but they did not; they soon became attentive, and perfect silence reigned. They were soon chained to his words; then, as was the custom, one after another rose to hear more perfectly; then they all rose, and pressed around him, and before he concluded, sobs and tears attested the power of simple argument modestly delivered. Edwards was b. in Conn., Oct. 5, 1703, and d. March 22, 1758. It has been the habit of some English writers to say that there is no such thing as American literature, assigning as their reason that the sameness of language makes it impossible, since it is all English literature. However, even those writers graciously admit that there are American authors, and unanimously name Jonathan Edwards as one. The name next following is that of Benjamin Franklin, whom, it is safe to say, all the world will admit to have been the most American of Americans. His career and works, literary and political, in philosophy, in social economies, and in diplomacy, are too well known for more than mere mention. Every child knows, or should know, the story of the poor apprentice who “tore the lightning from heaven and the scepter from tyrants,” and left to American literature the wisdom of an honest and a great mind. The struggle for liberty opened in the third quarter of the 18th c., and tinged for a time all spoken and written literature. With Edwards the domination of theology, which had continued from the landing of the Pilgrims, passed away, and philosophy and belles-lettres began to have audience. But the revolution suspended literary activity, except in the political sphere, and the names next after Franklin belong to the forum as well as the printed page. Prof. John Winthrop, of Harvard, intervened with lectures on earthquakes, storms, astronomy, and miscellaneous themes; and capt. Benjamin Church wrote a *History of King Philip's War*. William Livingston, governor of New York in 1776, was a notable writer for the newspapers, and author of a heavy didactic poem. Ezra Stiles, president of Yale college, left 45 volumes of diary and manuscripts. The first woman author after Anne Bradstreet, in our annals, was Mercy Warren (daughter of col. James Otis, of Barnstable, Mass.), who wrote *The Adulator*, a political

satire; *The Suck of Rome*, and *The Ladies of Castile*, works highly commended by John Adams.

Reaching the critical period of revolution, we pass hastily over the remainder of the century, necessarily mingling together orators and writers. James Otis was the oldest of the revolutionary leaders, a ready writer and a remarkable speaker. John Adams was early in the war of words. On the royalist side, "parson Peters" (the Rev. Samuel Peters) wrote, at a later period, a caustic *History of Connecticut*, full of wit and malice, and not bound by the truth. Thomas Paine must rank highest among those who contributed not only to our political emancipation but also to our literary fame. Francis Hopkinson, satirist, and William Bartram, traveler in the southern colonies, must be mentioned, the latter for his admirable descriptive powers. Thomas Jefferson; Josiah Quincy, jr.; Jeremy Belknap, distinguished clergyman; Lindley Murray, whose grammar was the *bête noir* of our grandfathers and grandmothers; John Jay, Huguenot jurist; Benjamin Rush, physician and philosopher, friend of Franklin; Richard Rusa, diplomat; William C. Redfield, meteorologist; Jonathan M. Sewall, poet; Hugh H. Brackenridge, politician, judge, and satirist—these bring us to John Trumbull, the author of *McFingal*, the best imitation of *Hudibras* ever produced, and of *The Progress of Dullness*, an elaborate epic poem. Then come John Ledyard, one of the most distinguished of travelers; and Philip Freneau, the first American poet of real fame, a prolific and gifted writer, from whom the fastidious Campbell deigned to borrow. James Madison and Gouverneur Morris must be mentioned; and then Timothy Dwight, president of Yale college, theologian and poet. We now find in the foreground a dark shade characteristic of our country—Phillis, a full-blooded African, brought here when a child, bought in the Boston slave market by a Mrs. Wheatly, whose name she took; a prodigy of intellect, and a poet of no mean order, complimented by Washington and by men of high position in New England. Another writer of the period was Benjamin Thompson, a student of science, better known as count Rumford; another poet was David Humphries, household and camp companion of Washington. He is followed by our first epic poet, whose works are still read, Joel Barlow, author of *The Vision of Columbus*, and *The Hasty Pudding*. Chief justice John Marshall's name brings us back to sober prose in his *Life of Washington*. Hannah Adams wrote a *History of New England*; Henry Lee wrote *Memoirs of the War in the Southern part of the United States*; Royal Tyler follows, a wit, a poet, and a chief justice, who wrote in one moment the gravest legal opinions and in the next the most delightful squibs.

And now we reach the name of a man whose untimely taking off was the destruction of the federal party, and doubtless changed the partisan complexion, if not the theory, of our government—Alexander Hamilton, Washington's mentor and chief reliance, the Ajax of federalism. Hamilton's writings are chiefly political, but they are characteristically American, and of the highest order of composition. Fisher Ames, the federal leader in congress, wrote political essays, and pronounced before the Massachusetts legislature a noble eulogy upon Washington. Noah Webster appears, who, if not a literary magnate himself, was the cause and aid of literature in others. Jedediah Morse gave the country its first geographical works soon after the establishment of the government. Albert Gallatin is a name deservedly famous in diplomacy and as a writer on finance. Francis Wayland, president of Brown university, left an undying *Treatise on Human Responsibility*, and other works. James Kent gave us *Commentaries on American Law*, which compelled the *Edinburgh Review* to say of him and Story, "They have done more than any other men to put an end to the indifference of English lawyers to the learning of their American brethren." Kent was of New York; and about this time that city had a savant of rare intellectual ability in Dr. Samuel L. Mitchell, and a historian and dramatic author of note in William Dunlap. At the same time the whole land, and English people everywhere, were honored with the first American ornithologist, Alexander Wilson—a Scotchman, however, by birth. His seventy-volume *Ornithology* is a standard work. But we must close the century by rapid mention of John Quincy Adams, young but becoming known as a writer; De Witt Clinton, beginning to be heard from; Joseph Dennie, journalist, author, and critic, the "Lay Preacher" of a monthly publication; David Rittenhouse, astronomer and mathematician, of whom high authority said, "We should place him in point of scientific merit second to Franklin alone;" and, to finish the century and the revolutionary era, we name the first American novelist, Charles Brockden Brown, a Philadelphian, whose Quaker ancestors came over with William Penn. Brown's *Wieland*, or the *Transformation* (1798), *Ormond*, or the *Secret Witness* (1799), and *Arthur Mervyn* (1800), are works of acknowledged merit, and he is highly eulogized by Prescott.

The earliest American name of note in the book-making of the 19th c. is William Wirt, a Maryland lawyer, author of *Letters of a British Spy*, and an admirable *Life of Patrick Henry*, attorney-general of the United States, and once a candidate for president. About the same time the country was amused by Thomas Green Fessenden, who sent forth *Terrible Tractoriation*, a satire on the wonderful medical discovery of metallic tractors; also political satire; and a humorous story in verse called *The Country Lovers*, which was republished in England. In theological writing the names of Archibald Alexander and Lyman Beecher are conspicuous; and amidst this abundance of seriousness and satire comes the learned, pleasant, and genial John James Audubon, the

distinguished American ornithologist and naturalist, of whose great book Cuvier said, "It is the most magnificent monument that art has ever erected to ornithology."

In the days of these men and their immediate successors literary activity was suppressed by the political events of the hour. We had barely escaped war with France in Jefferson's administration, but did not escape one with England in Madison's. There could be little of importation from abroad, and the means for producing books at home were primitive and restricted. Our next literature was necessarily for the most part political, and the forum was its place of expression. There we find Henry Clay, Calhoun, and, somewhat later, Webster and Benton. But during or after the war, we hear from such writers as Henry M. Breckenridge (*History of the Second War with Great Britain*); Moses Stuart, the father of American biblical criticism; William Ellery Channing, theologian, and writer on many subjects, of whom it was said in *Frazer's Magazine* "Channing is unquestionably the first writer of the age. From his writings may be extracted some of the richest poetry and richest conceptions clothed in language unfortunately for our literature too little studied in the days in which we live." Then Timothy Flint first made us acquainted with the valley of the Mississippi; and Henry Wheaton, in his *History of the North Men*, gave us our first knowledge of the people who discovered and dwelt in America five centuries before Columbus made the second discovery.

Both the political and literary fields now began to glow with the rising fame of Daniel Webster and Thomas Hart Benton, for years the eastern and western stars in the galaxy of American statesmen, while Clay and Calhoun shone steadily from the south. The true day of American literature was at hand; the sun that was to rise never again to set while we are a nation was lighting the morning horizon—the literary sun, that came in the person of Washington Irving. Born after the revolution and of age just as the second war closed, he seems to have escaped the affliction of politics and partisanship, and to have grown up thoroughly a man of letters. It is quite unnecessary to refer to his many works, historical or imaginative, for they are everywhere known. Irving was the first author of note to employ that style of humorous exaggeration which has been so much abused in our days, and whose abuse foreigners choose to call the great blot upon American literature. We presume there will be no vote against accepting *Diedrich Knickerbocker* as a typical American author, the Magnus Apollo, in our galaxy of literary gods. There was another American author in the same period (John Sanderson), whose work, *The American in Paris*, was thought worthy of translation by no less a writer than Jules Janin. Gulian C. Verplanck appeared anonymously as a political satirist in 1819, and was afterwards the author of many discourses on art and literature. In 1827, Richard H. Dana published *The Buccaneer*, and in 1833 *The Idle Man*, the one highly praised by prof. Wilson in *Blackwood*, and the other by William C. Bryant. The next conspicuous star in the literary galaxy is James Fenimore Cooper, the most prolific and most popular of American writers of fiction. "He wrote," says Bryant, "for mankind at large; hence it is that he has earned a fame wider than any author of modern times. The creations of his genius shall survive through centuries to come, and only perish with our language." Among poets of note at this period are Charles Sprague, Lydia H. Sigourney, James A. Hillhouse, Henry Timrod, and John G. C. Brainerd, whose poems passed to a third edition in 1842, edited by John G. Whittier. In John Howard Payne we had a precocious but gifted dramatist; in Henry Rowe Schoolcraft a diligent student and historian of the Indians; in Henry C. Carey an able political economist; in John Neal a poet and critic, and the first writer on American literature for foreign readers (in a series of articles in *Blackwood*); in Jared Sparks a careful and voluminous historian; in Edward Robinson an accomplished biblical scholar; and in William Ware a writer of classical romances.

William Cullen Bryant led the modern army of American poets by the publication of *Thanatopsis* in 1816, immediately followed by Joseph Rodman Drake, Fitz Greene Halleck, James G. Percival, and Maria Brooks. In the same period, or soon after, we find John P. Kennedy, the novelist, with *Scallow Barn* and *Horse Shoe Robinson*; Horace Mann on education; George Bush in biblical lore and Hebrew grammar; George Ticknor in *History of Spanish Literature*; James K. Paulding, co-laborer with Irving; Washington Allston, painter and poet; Robert C. Sands, in history and fiction; and minor lights.

Edward Everett, his brother Alexander H., William Prescott, and George Bancroft form the front rank of modern American historians, and at least three of them have won deservedly high renown; and later in the same department appear John L. Stephens, Richard Hildreth, John R. Brodhead, J. Lothrop Motley, and Francis Parkman. In lighter literature we find George P. Morris, George D. Prentice, Theodore S. Fay, William Gilmore Simms, Nathaniel P. Willis, Joseph C. Neal, Charles Fenno Hoffman, and Willis Gaylord Clark. George P. Marsh has written upon Scandinavian languages; S. G. Goodrich (Peter Parley) for the young; George B. Cheever on political and moral reform; Ralph Hoyt some unique poems; Robert T. Conrad successful dramas; Elihu Burritt (the "Learned Blacksmith") his reflections; Alfred B. Street pastoral poetry; William W. Story a volume of poems; Edwin P. Whipple critical essays; Donald G. Mitchell ("Ik Marvel") pleasant essays; Frederick S. Cozzens similar works; George W. Curtis the *Potiphar Papers*; William Allen Butler, *Nothing to Wear*; Robert Dale Owen on mysticism; E. L. Youmans on chemistry and other sciences; Richard Grant White on *Shakespeare*, and criticisms on grammar and words; William T. Adams ("Oliver

Optic") for boys and girls; J. T. Trowbridge poems and domestic stories; and A. Bronson Alcott on education and philosophy.

Four distinguished American poets are living at this writing—Henry W. Longfellow, John G. Whittier, Oliver Wendell Holmes, and J. Russell Lowell. Among other poets to be mentioned are Edgar A. Poe, T. Buchanan Read, George H. Boker, Richard H. Stoddard, Thomas B. Aldrich, Edmund C. Stedman, Henry T. Tuckerman, and Joaquin Miller. Of humorists we have had lieut. Derby ("John Phenix"), Mortimer M. Thompson ("Doesticks"), Charles G. Leland in the *Hans Breitman Ballads*, John G. Saxe, Samuel L. Clemens ("Mark Twain"), Francis Bret Harte, and a host of minor writers.

In both poetry and philosophy few names rank as high as that of Ralph Waldo Emerson, everywhere acknowledged as the first of idealist and speculative reasoners. He is in some degree followed by Henry D. Thoreau. The name of Nathaniel Hawthorne, author of *Twice Told Tales*, *The Scarlet Letter*, *The House of Seven Gables*, and *The Marble Faun*; of Theodore Parker, William E. Channing, Richard H. Dana, jr., Bayard Taylor, Josiah G. Holland, James Parton, Henry Ward Beecher, Theodore Winthrop, Thomas W. Higginson, Charles Dudley Warner, Moncure D. Conway, Edward Eggleston, William D. Howells, and of many others still busied in literature, will occur to the intelligent reader.

American literature owes much to woman. In no other country are there so many female writers, or so large a proportion of women of superior education. We have casually mentioned a few names, but there are many more that should be noted. Anne Bradstreet was the earliest, writing poems soon after the landing at Plymouth. Ann Eliza Schuyler (Mrs. John J. Bleeker) wrote a tragedy and poems just before the revolution. Hannah Adams, b. 1756, the first American woman to devote herself entirely to literature, wrote a *History of New England*, a *History of the Jews*, and *Views on Religious Opinions*. Susannah Rowson, b. about 1762, was the author of *Charlotte Temple*, the most popular story of the early part of this century, also of other stories, an opera, farces, poems, and sacred history. Tabitha Gilman (Mrs. Samuel Tenney), b. 1762, was the author of *Female Quixotism*; Eliza Leslie, b. 1787, was the first American woman who wrote stories for the young; Sarah Josepha Buell (Mrs. David Hale), poet and editor of the *Lady's Book*, wrote *Sketches of American Character*, *Sketches of all Distinguished Women*, and many tales and poems; Lydia Huntley (Mrs. Charles Sigourney), b. 1791, was for many years the foremost author of her sex in the country, and the first American woman to become well known abroad by her works; Caroline Harwood (Mrs. Samuel Gilman) produced poems, ballads, and sketches; Maria Gowen, or Mrs. Maria Brooks ("Maria del Occidente"), b. 1795, was the author of *Zophiel, or the Bride of Seven*, a weird story in verse in seven cantos, and of various poems of merit, including *Idomen, or the Vale of Yumurti*, in which she tells the story of her singularly romantic life; Mrs. Follen, widow of prof. F., who was lost in the burning of the steam-boat *Lexington*, in 1840, was an interesting writer. The name of Catharine M. Sedgwick stands deservedly high, and her works, *A New England Tale*, *Red-wood*, *Hope Leslie*, *The Lincolns*, and others are held in esteem. Mrs. Hannah F. Lee's *Three Experiments in Living* won great popularity. Maria J. McIntosh ("Aunt Kitty") wrote tales for children, stories for older folks, *Woman in America*, and other works. Lydia Maria Francis (Mrs. Lydia Maria Child) is a name widely known and honored for works adapted to the household, books of biography, and excellent *Letters from New York*. The sisters Lucretia Maria and Margaret Miller Davidson were remarkable instances of precocity in verse and prose. Mrs. Emma C. Embury, daughter of Dr. J. R. Manley, wrote a volume of poems and many prose sketches. Caroline Lee Whiting (Mrs. Hentz) excelled in the same line. Sarah Helen Power (Mrs. Whitman) published a volume of poems of superior merit. Hannah F. Gould's name is familiar to all readers of verse. Margaret Fuller (Countess Ossoli), whose melancholy fate by shipwreck is not forgotten, was one of the most terse and vigorous of American writers, a thorough scholar, and a critic of rare ability in art, literature, and social science. Mrs. Ann S. Stephens is another popular author, her latest work being a *Pictorial History of the War for the Union*. Frances Sargent Locke (Mrs. F. S. Osgood) is a well-known writer of verse and prose, sketches, and of a drama. Elizabeth Cakes Prince (Mrs. E. Oakes Smith) has published poems, a number of stories, and two tragedies, one upon a purely American theme, called *Jacob Leister*, relating to the politico-religious rebellion in New York in 1689. Caroline M. Stansbury (Mrs. C. M. Kirkland) wrote books and letters descriptive of the west as it was 40 years ago; also critical essays and fireside books, full of common-sense and keen insight of character.

Coming to modern days, we meet the name of Harriet E. Beecher (Mrs. H. B. Stowe), whose *Uncle Tom's Cabin* has had a wider reading than any other book written by a woman. She is the author of many other works of fiction and fact, and of a volume of poems. Elizabeth F. Lummis (Mrs. E. F. Ellet) has written *Women of the American Revolution*, *Pioneer Women of the West*, *Women Artists*, *Queens of American Society*, *Brides and Widows of the Bible*, and lighter works. Anna Cora Ogden (Mrs. A. C. Mowatt, and Mrs. Ritchie) is remembered as an actress of ability, and as author of *Mimic Life*, of the comedy of *Fashion*, and various stories. We hastily pass on, mentioning Mrs. Mary E. Hewitt's *Heroines of History*, and verses; Mrs. Emma D. E. N. Southworth's thirty-five volumes of novels; Susan Warner's *Wide, Wide World*, *Queechy*, and

*Hills of the Shatemuc*; her sister Anna's *Wayfaring Hymns*; Mrs. Emily C. Judson's ("Fanny Forester") *Village Sketches*, and verses; Anna C. Lynch's (Mrs. Botta) *Handbook of Universal Literature*; and Caroline M. Fisher's (Mrs. C. M. Sawyer) verses. About 30 years ago, Mrs. Amelia B. Welby was one of the most popular of American poetic writers, and Lucy Hooper, who died at the age of 25, was the literary light of Long Island. Mrs. Estelle Anne Lewis has published many poems here and in Europe, letters of travel and on literature and art, and several dramas, one of which was accepted by Ristori; Julia Ward (Mrs. S. G. Howe) will be oftenest remembered by one of the least poetical of her universally excellent poems—*The Battle Hymn of the Republic*; she has published *Passion Flowers*, her first volume of poems; *Words for the Hour*, a second poetical volume; *Hippolytus, a Tragedy*, and many prose contributions in magazines and newspapers. The names of Alice Bradley (Mrs. Alice B. Neal, and Mrs. Haven), of Misses Catherine and Eleanor Ware, of Sarah S. Jacobs, and Mrs. Elizabeth C. Kinney, bring us to Sarah Jane Clarke (Mrs. Lippincott, or "Grace Greenwood"), whose lectures and letters from abroad are well known to cultivated people. Her juvenile stories have been repeatedly published, and widely read. We scarcely need mention the Carey sisters (Alice and Phoebe), so much in print 30 years ago, mainly in verses of the quiet domestic kind; or Caroline Cheesbro's *Dreamland by Daylight* and *Little Cross-Bearers*; or Mrs. Eliza W. Farnham's philanthropic writings. Mary L. Booth, editor of *Harper's Bazar*, has won deserved fame as a historical writer; Louisa Chandler Moulton as sketch writer, critic, and correspondent; Mrs. Julia C. R. Dorr for novels and poems; Mary Clemmer for sketches of life in Washington, and *Outlines of Men, Women, and Things*; Margaret T. Preston for poems; Helen Fiske Hunt ("H. H.") for excellent verse, *Bits of Travel*, *Bits of Talk about Home Matters*, and magazine articles; Elizabeth Akers Allen ("Florence Percy") for *Rock me to Sleep*, *Mother*, and other poems of wide popularity; Louisa May Alcott for *Hospital Sketches*, novels, stories for children, and sketches of travel; Harriet Prescott Spofford for novelettes and stories; Sarah M. B. Piatt for poetry; Mary Virginia Terhune ("Marion Harland") for a long list of novels; Elizabeth Stuart Phelps for *The Gates Ajar*, *The Silent Partner*, and many short stories; and Celia Thaxter for poems. Of sketch writers for literary journals no one has surpassed Sarah Payson Willis, wife of James Parton, sister of N. P. Willis ("Fanny Fern"), whose sensible and often caustic short articles in the *New York Ledger* were deservedly famous. Mary Abigail Dodge ("Gail Hamilton") has employed a pungent pen in many articles on political and social subjects for magazines and journals, and in volumes of sketches and essays. This list of women authors might be greatly enlarged, but names enough are given to show that the sex contributes its full share to the instruction and gratification of the reading public.

In considering American literature the newspapers must not be overlooked. In no other country have the daily or weekly journals anything like so broad a field and so great an influence. It is quite probable that there are to-day published in the United States as many daily and weekly newspapers as in all the world besides, and quite as probable that their circulation among less than 50,000,000 of the Americans is twice as great as that of all the others among the 28 times as many people who constitute the population of the rest of the world. In 1835, the daily and weekly newspapers in the United States numbered 1253; in 1840, 1404; in 1850, 2032; in 1860, 3543; in 1870, 4869; in 1879, 7478. The whole number of serials, daily, tri-weekly, semi-weekly, bi-weekly, semi-monthly, monthly, bi-monthly, and quarterly, in 1879, was 8579, an increase in 9 years of 2708, or nearly 50 per cent. The aggregate issues of these prints for one year are about 2,500,000,000 copies, enough to furnish an average of three papers or magazines each week to every family in the country. In this country, people read newspapers, whether they read anything else or not. In boats, stages, cars, at rest, at lunch, everywhere except in actual-business, or in church, or asleep, one sees the inevitable newspaper among all classes, from the shop-girl with her single weekly story-paper, to the merchant with all the daily journals within his reach. Such universal reading cannot fail to have a powerful effect upon the literary taste and character of the people, for it must be understood that the newspapers contain not only the news, but fill a large portion of their space with essays, tales, poems, discussions, and information, aside from the mere transactions of the day. Then, too, the American press is notably personal, and readers look to see what this or that editor, rather than this or that journal, has to say; and the peculiar style of a popular editor is often distinctly impressed upon his readers. In the field of politics the editor of a well-established journal is generally a power, often almost an autocrat; and quite naturally a similar power attaches to eminent editors in other fields. Again, a large proportion of eminent editors have been book-makers also, and as many book-makers have reached the dignity of authors through earlier efforts in the newspapers. William Cullen Bryant was both editor and author all his life; so was Benjamin Franklin for the most of his early life; the Warrens, Adamses, and Quincys of the revolution wrote for the press; so did James Otis, Alexander Hamilton, Burr, the Clintons, and a throng of statesmen. Freneau, the poet, was an editor; Noah Webster was an editor; so was Henry Wheaton, who was succeeded by Mordecai M. Noah. The names of Horace Greeley, Henry J. Raymond, William L. Stone, William Leggett, Francis P. Blair, Thurlow Weed, James Watson Webb, George D. Prentice, George W. Kendall, Duff Green, Hezekiah Niles, Henry B. Anthony, John G. Whittier, John C.

Rives, Samuel Bowles, Joseph R. Hawley, Henry Ward Beecher, Sidney E. Morse, George W. Childs, Joseph R. Chandler, George P. Morris, Nathaniel P. Willis, Edwin Crosswell, Matthew L. Davis, William Colman, Theodore Dwight, Edward Everett, Joseph Gales, William Lloyd Garrison, Charles G. Green, Richard Hildreth, Amos Kendall, Charles King, John Neal, James K. Paulding, John Howard Payne, William C. Prime, R. Barnwell Rhett, George Ripley, George William Curtis, Bayard Taylor, Henry B. Stanton, Thomas Ritchie, Epes Sargent, Isaiah Thomas, Gullian C. Verplanck, Robert Walsh, Robert C. Winthrop, William Wirt, and many others, dead and living, belong alike to literature and journalism. Many of the most famous authors in the country first felt their way, like Washington Irving, in the newspapers of their time. The intimate connection between journalism and authorship is manifest, and the great influence of the newspapers not only in informing the people but in molding their habits of thought and expression is equally clear. And in late years the character of newspaper writing has been greatly elevated. The press now demands and secures the best talent, and the editorial portion of some daily newspapers approaches in careful writing the pages of Hume and Macaulay.

A glance over the field shows that there was little of pronounced American literature until near the time of the war for independence. What we had was mostly religious disputation. The stamp act aroused the people and filled the land with political literature, some of it of excellent quality; but there was little else until long after the revolution. It should be remembered that the conditions of a new country are never favorable to literary culture. The man who has to clear away the forests, build his cabin, and plant and gather crops, knows little of the "groves of Academe." It is not a little to the credit of Americans that within the first century of the hard, practical work of subduing a wild country, they have found or made leisure to do anything in the way of high literature. Now a literary class is taking its place as one of the institutions of our social life. Science, art, the profoundest philosophy, the most careful linguistic criticism and study, already challenge for America an equal place with the foremost nations of Europe.

**AMERICAN MUSEUM OF NATURAL HISTORY**, incorporated by the legislature of New York in 1869, open free, situated near the Central Park, New York. This institution was begun by private citizens, but is public in its nature, and is constantly receiving donations from private sources and from officers of the government. In 1874, a building was begun which when completed will surround a plot of 18½ acres. The portion finished is four stories high, with exhibition halls 170 by 60 ft. Among its attractions are collections of shells, skeletons of rare animals, building stone from Japan, woods from Bermuda, skeletons of man and other animals, a great variety of living mammals, birds alive and dead, archaeological relics from the Pacific Islands, war instruments from savage nations, models of cliff dwellings of Colorado, pottery of the mound-builders, implements from the lake dwellings of Switzerland, stone implements from the valley of the Somme, skeletons of extinct gigantic birds. Geology is largely represented. The A. M. is under private management, and is rapidly growing in extent and importance. See **ARCHEOLOGY**.

**AMERICAN RIVER**, in n. central California; its n. and s. fork are in the w. part of Eldorado county. It flows s.w. and joins the Sacramento a little above Sacramento city.

**AMERICAN WINES** are now an important and rapidly increasing product. When the Northmen from Iceland and Greenland visited the coast of Massachusetts and Rhode Island, between 995 and 1000 A.D., one of their sailors was a German, named Tyrker. One day he came from a stroll in the woods in a state apparently of intoxication, muttering incoherently in his native tongue. He had discovered wild grapes, a fruit unknown to the Icelanders, and had made a temporary wine-press of himself by eating them to his fill. We hear no more of grapes in America (for the colony of Northmen did not become permanent) until the middle of the 16th c., when wine was made in Florida from the wild grapes still so abundant there. Grape-growing was tried by the early English settlers in Virginia, but did not continue as a business. Thirty years later, however, wine was made there, and special rewards were offered to sustain the business. The first English governor of New York in 1664 granted to one Richards, a wealthy citizen, the privilege of selling native wines without tax, and he undertook grape culture upon an extended scale. About the same period wine was made in Delaware, and its production was tried but failed under the auspices of William Penn, though it succeeded in New Jersey. The early French settlers in Illinois made wine in considerable quantity before the close of the 18th c.; and the Harmonists, who settled in Pennsylvania in 1803, being Germans, naturally went into the business, taking it with them to Indiana. There is hardly a state of the union out of New England in which grape-growing has not been tried with success. The wine was brought to southern California by the early Jesuit missionaries, who planted cuttings at first, but as these did not fulfill their expectations, they tried the seeds found in raisins, and from these came the abundant and prolific Los Angeles grape, the only kind raised in California until about 1820. This, with a variety supposed to have come from Madeira, is known as the "California grape," and makes nearly two thirds of the grape crop of the state.

Within the past dozen years nearly 200 different grapes have been tried in California, and most of them have done well. There are now some very large vineyards, including from 100 to 450 acres, and from hundreds to hundreds of thousands of vines. Some of the varieties largely cultivated are the Catawba, Concord, Delaware, Diana, Isabella, and Ives; and of foreign origin, the Black Hamburg, Chasselas, Muscatel, and Tokay. White, red, and sparkling wines are produced in California. Hock is fine and strong and much in demand; port is dark, sweet, and strong; sherry, muscatel, and Madeira are made, but not largely. The sparkling wines are good, but not equal to those of Europe. The process of wine making in one of the largest of the California vineyards is as follows: About Sept. 1, the pickers, each with a basket, begin work, followed by a wagon to receive their gatherings, which is furnished with boxes each holding 90 lbs. of grapes. When loaded with a ton and a half of fruit the wagon is drawn to the press. The grapes are first cast into a sieve with meshes about three quarters of an inch square. This sieve is the "stemmer," and as workmen with wooden hoes draw the bunches two and fro, the berries drop through the meshes, and the stems are left in the sieve. From the stemmer the berries drop into the hopper just below, at the bottom of which are two rollers, separated from each other about three sixteenths of an inch, one about four inches more in diameter than the other. As the rollers rotate at the same speed as to their axes, and one has the greater diameter, it follows that the rate of speed at the circumference is different. This results in the rubbing of the skin of the grape sufficiently to thoroughly break it, and, to a certain extent, mash the pulp. Immediately below the rollers is a receiver, a long wooden box with a false bottom, and into this the broken berries fall. A large part of the juice drains from them and is pumped into vats to ferment for the purpose of making white wine. Remaining in the receiver is a mass of pomace. If red wine, such as claret or burgundy, is desired, this pomace is placed in vats. If white wine only be wanted, then it is taken at once to the press and all the juice in it extracted. The press presents a remarkable appearance. Imagine a beam 56 feet long, 12 inches thick, and 14 inches high, with one end having an iron rod run through and the other fastened to a rope running over a pulley. The frame which holds down the beam is built of the strongest oak timber and firmly anchored in the earth. About three feet in front of it stands the press itself, a movable box made with clasps so that it can be opened at will, and standing on a bed rather larger than itself. The pulp arrives to be pressed, the beam is raised by the tackle, and the pulp is placed in the box, which is about  $3\frac{1}{2}$  ft. square, and 3 ft. high. After the box has been filled, boards which exactly fix the box are placed on top of the pulp. Across them others are placed, and again and again is this done until there are four tiers of wood, each tier crossing the one below it. Then the long beam is let down, slowly at first, but with constantly increasing pressure. The first thing to be done with the juice is to bring it to fermentation. For red wine the pomace is not pressed as it comes from the receiver, but is placed in a large vat, filling the vat about four fifths full. On top is placed a cover, held in place by four screws, and pierced with a great many little holes. On the second day the fermentation begins, and the wine commences to rise through the holes and swell up in the vat. The pomace being kept down by the cover, and being covered with wine, cannot come in contact with the air; if it did it would sour and spoil the wine. At the end of six or seven days the fermentation subsides, and the wine is drawn, or "racked," off into casks, which are kept full all the time. A second fermentation then takes place, which continues for three or four weeks, during which time the bung-holes of the casks are kept partly open, to allow the gases to escape; then the wine is ready for storage. The lees that remain after the wine is racked off are gathered and allowed to settle once more, and the second drawing is used to give body to light wines, or distilled into brandy. The process of making white wine differs from the former in only the preliminaries. The juice which runs from the grapes at first and that which is expressed from the new pomace is pumped into casks to ferment. The fermentation begins in about two days' time, and continues about six or seven days; during that period it discharges through the bung-hole of the cask a thick, greenish-yellow matter of the consistency of molasses. This is the vegetable matter remaining in the wine, and it has to be cleaned off twice a day. The casks, too, are kept filled with new wine all the time, in order to prevent any of the vegetable matter souring. Fermentation having ceased, the after operations are the same for both red and white. After the wine has lain in casks four or five months, it is once more racked off into fresh casks, and the sediment, amounting to about ten per cent., left behind. This is all thrown together and allowed to settle again. During the first year this racking takes place three times. A curious thing is that during the first year, about the time when the vines begin to throw out their branches, the wine undergoes what is called the after fermentation, and changes itself for the last time. During the second year the wine is racked twice, and during the third once. It is then fit for market.

The grapes used in the manufacture of California sherry consist of two varieties, the Bogota and Mission, equal quantities of each being placed in the press. They are allowed to hang upon the vine until about the middle of Nov., when they become dead ripe and slightly shriveled. They are picked about two hours after sunrise, when thoroughly dry, and are taken to the press. The juice which flows from the machine is very sweet, and runs into vats placed in the warmest part of the cellar. Here fermentation takes

place as with other wines; but in order to prolong this process as much as possible the juice is stirred three or four times a day. The result of this agitation is to produce a strong, rich, sweet, and heady wine, which is the foundation of future sherry. After five or six months it is racked off into fresh casks, and these are taken to a hot-house, the roof of which is made of glass, where they are placed upon frames of heavy scantling and exposed to the heat of the sun. The house is kept at a heat from 120° to 140° F., and in this temperature the wine remains for six or eight months. During the time, the casks are rolled over three or four times every week. This continued exposure to the influence of heat develops in the wine that dry flavor so much admired by connoisseurs of sherry; it also loses no small part of its strength. The wine, when it first comes from the vats in which it is fermented, is one third as strong as brandy, but after it has been exposed for such a length of time to the action of the sun, part of the alcohol has evaporated and the wine becomes fit for table use. From the hot-house the wine is taken back to the cellar, where it is kept for six or seven months more at a temperature of about 65°, during which time it often happens that a second and milder fermentation takes place. If the wine is intended to be cheap sherry, it is then ready for market. If it is intended to be a finer and more expensive grade of wine, during the following summer it is again placed in the hot-house, and subjected to the heat of the sun, for the oftener this process of heating and moving the wine is performed—within certain limits—the finer and better does it become, and the higher is the flavor developed.

Another process of manufacturing sherry is much more rapid than that described, although the result may not be so satisfactory to a lover of wine. It is called the Searle process, and is patented. In it the vats containing the wine are connected with pipes and have coils of pipe in them. Through these, steam is forced, and produces the necessary heating of the wine and expulsion of the alcohol. By this process the sherry is ripened much sooner than in any other way.

The wines of the Atlantic states are in great variety, though not very abundant. Nicholas Longworth is remembered as the most active promoter of the manufacture of Catawba wine, which is now widely extended. His vineyard was near Cincinnati, and there are still extensive grape-growers in Ohio and the states westward. This grape grows well around lake Erie, and makes a light-colored wine that is highly appreciated. Sherry of fine quality is made from the Cunningham and Hermann grapes. Some grapes, such as the Scuppernong, do not thrive in the north, but are largely grown in the southern states. At the present time the production of native wines is probably nearly 30,000,000 gallons per year, of which about one third is from California; and the business is advancing rapidly.

**AMERICUS**, the co. seat of Sumter co., Ga.; 70 m. s.s.w. of Macon, on the Southwestern railroad. It has several churches, and a college for women. Pop. '70, 3259.

**AMERIGO VESPUCCI**, a naval astronomer, from whom America accidentally received its name, was b. at Florence, Mar. 9, 1451. His father was a notary. The education of A. was intrusted to his uncle, Giorgio Antonio Vespucci, a monk and apparently a man of superior enlightenment. The youth made but indifferent progress in his Latin grammar, though he showed great aptitude and liking for natural philosophy, astronomy, and geography—at that period, favorite objects of study, on account of their commercial importance. It is not precisely ascertained when he first went to Spain. We find him there, however, in 1486, engaged in mercantile pursuits. He was at the head of a large Florentine firm in Seville in 1496, when Columbus was making preparations for a second voyage to the new world. The success of the great discoverer inflamed A. with a passion for discovery, and having abandoned "business," he sailed from Cadiz on the 20th May, 1499, in the expedition commanded by admiral Hojeda, and, after a voyage of 37 days, arrived at that portion of the continent of America now called Cumana, explored the bay of Paria, lying between the isle of Trinidad and the mainland, and some hundreds of miles along the coast. He returned in the autumn of the same year, but commenced a second voyage under admiral Pinzon in Dec., which resulted in the discovery of a crowd of small islands on the s. of the gulf of Mexico. He was now allured by promises into the service of Emanuel, king of Portugal, and undertook two other voyages with Portuguese ships: the first on the 10th of May, 1501, and the second on the 10th of May, 1503. His purpose was to sail westward, in hopes of discovering a passage to Malacca, the extreme point of discovery in the e. He lost one of his ships; and it was only after encountering great perils that the other five found refuge in All Saints' bay, on the coast of Brazil. The monarch gave orders that some remains of the ship *Victoria*, in which A. made his last voyage, should be suspended in the cathedral of Lisbon, but fulfilled none of the promises which he had made. A. consequently returned to Spain, and in the year 1508 succeeded in obtaining the office of piloto-major. He died at Seville on the 22d of Feb., 1512.

The character of A. V. has been covered with a great deal of unmerited obloquy. He has been accused of endeavoring to claim the honor of discoveries which he never made, and has been commonly regarded as an unprincipled adventurer. Humboldt, however, has successfully vindicated him from such aspersions. He had a very considerable knowledge of various branches of science, and it was on account of his superior attainments in these that he was selected to accompany the expeditions as naval

astronomer. He was a prompt and skillful inspector of the commissariat while under his control; vigorous, practical, and severe in his demands for increased knowledge on the part of the naval functionaries under him; an earnest navigator and close friend of Columbus in the last years of the great admiral's life. How America came to receive its name from him is not quite clear; but it is certain, from Humboldt's investigation, that A. himself had nothing to do with it. The name of the new world probably came from Germany. A selection from A.'s narrative of his American voyages found its way into that country. Martin Waldseemüller of Freiburg in Baden translated it for a bookseller of St. Diez in Lorraine. As the first account of the wonderful discovery, it was greedily devoured. Edition after edition was printed off, and, according to Humboldt, it was Waldseemüller who proposed that the new world should be called America in honor of the author. Afterwards, this name was generally employed by geographical writers, and even the Spaniards and Portuguese adopted it.

**AMERSTOET**, an ancient t. in the Netherlands, province of Utrecht, on the Eem, which flows into the Zuiderzee, has a large trade in grain. Tobacco is grown in the district, and cotton and woolen goods, leather, soap, beer, etc., are manufactured. The church of St. Joris was completed in 1248. A. has a Jansenist college and court of justice. Here the statesman Oldenbarneveld, and the architect of the palace in Amsterdam, Jacob van Campen, were born. The railway from Amsterdam by Utrecht to Zwolle passes A., and a direct line between it and the former city is being constructed. Pop. 13,230.

**AMES, EDWARD R.**, D.D.; 1806-1879; bishop of the Methodist Episcopal church. In 1826 he entered Ohio university. In 1828 he opened a high school at Lebanon, Ill., the germ of McKendree college; in 1830 he became an itinerant preacher of the Indiana conference; he was a delegate to the general conference in 1840, and afterwards corresponding secretary of the missionary society for the south and west. From 1844 to 1852 he was presiding elder of the Indiana conference, and was elected bishop in 1852. He was the first Methodist bishop to visit the Pacific coast. During the war he served on important commissions for the exchange of prisoners and other work.

**AMES, FISHER**; 1758-1808; b. Mass.; son of Nathaniel Ames; graduated at Harvard in 1774. He practiced law, and went into politics. In 1788 he bore a distinguished part in the Massachusetts convention to ratify the federal constitution, pleading with rare eloquence for the adoption of the new organic law. His first political ventures were in essays in the newspapers signed "Camillus" and "Brutus," and, when the authorship became known, it gave him a place among the most prominent federalists. When the new government went into operation he was the first representative in congress for the district including Boston, and he served through Washington's administration, taking high rank among the orators of the time. After leaving congress he took no prominent part in politics, though his pen was frequently employed. He pronounced the eulogy on Washington before the Massachusetts legislature. He spent his last years of failing health in retirement. He always had gloomy forebodings of the destiny of his country, as, in common with many federalists of his time, he doubted the permanent vitality of a republican form of government. His orations, essays, letters, etc., have been published by his son. He was attractive in appearance, gentle in manners, and the coruscations of his wit and imagination were incessant.

**AMES, JOSEPH**, 1825-72; b. N. H.; an American portrait painter, working many years in Boston, where he made portraits of Daniel Webster, Pius IX., Rachel, Rufus Choate, and others. His *Death of Webster* is well known.

**AMES, WILLIAM**, D.D., 1576-1633; an English independent theologian, fellow of Christ college, Cambridge; he left England during the reign of James I. to avoid expulsion, became minister of the English church at the Hague, and afterwards occupied the divinity chair in Frankener university. He was at Rotterdam, expecting to sail for America, when his death occurred. He left many important theological works.

**AMESBURY**, a t. in Essex co., Mass., 40 m. n. of Boston; pop. '80, 3,355. There are in the town half a dozen woolen mills, nearly 20 carriage factories, a national bank, and a savings-bank. A. is the home of the Quaker poet John G. Whittier.

**AMETHYST**, a variety of quartz (q.v.), differing from common quartz and rock-crystal chiefly in its beautiful violet-blue or purplish violet color—well known as *amethystine*—which is owing to the presence of a little peroxide of iron or of manganese. It is one of the most esteemed varieties of quartz, and is much employed for seals, rings, etc., although, being comparatively abundant, it is much inferior in price to the true gems. An amethystine tinge is frequently to be observed in specimens of quartz, which yet are not perfect A. The tinge is often very faint, and is frequently confined to the summits or edges of the crystals. The finest specimens of A. are brought from India, Ceylon, and Brazil. It is, however, a common mineral in Europe, and occurs in many parts of Scotland. It frequently occurs lining the interior of balls or geodes of agate, and in veins and cavities in greenstone and other rocks. The ancients imagined it to possess the property of preventing intoxication, and persons much addicted to drinking therefore wore it on their necks. The name is derived from a Greek word which signifies *unintoxicated*.—Not to be confounded with this mineral is that sometimes called the

*oriental A.*, which is a variety of spinel (q.v.) having an amethystine color, and is a very valuable gem. False *A.* made of glass or *paste* are very common, and in general very coarse; but a very perfect imitation can be and sometimes is made.

AMGA', a river of Siberia, rising in the Yablounoy mountains, running n.e. about 400 m. and joining the Aldan, one of the tributaries of the Lena. At Amginsk its breadth is 2000 ft.

AMHARIC LANGUAGE, named from the important province of Amhara; the principal tongue of Abyssinia; with some variations of dialect, used throughout the kingdom. It is of ancient Semitic stock, and relates to the old Ethiopian or Gees, which it superseded early in the 14th century. Its alphabet is the Ethiopic with some added letters; and like that language, it strongly resembles the Arabic, though with the mixture of many African words. Little is known of the *A. L.* in literature, though the Bible has been printed in it.

AMHERST, a co. in w. central Virginia, between the James river and the Blue ridge; 418 sq.m.; pop. '80, 18,768—6704 colored. It has charming scenery and fertile soil; the chief products are wheat, corn, oats, tobacco, and butter. The Virginia and Tennessee railroad intersects it. Co. seat, Amherst Court House.

AMHERST, a t. in Hampshire co., Mass., 82 m. w. of Boston on a branch of the Connecticut river; pop. '80, 4,299. It has six or eight churches, four paper-mills, various factories, and a weekly newspaper. The scenery is picturesque, with beautiful views of the Holyoke range and other mountains. The seat of the Massachusetts agricultural college, with its large greenhouses and the Durfee plant-house, probably the most successful agricultural school in the country. Amherst college, founded here in 1821, is one of the leading institutions of the country. (See AMHERST COLLEGE and MASSACHUSETTS AGRICULTURAL COLLEGE.)

AMHERST, a seaport of Tenasserim, on the e. shore of the bay of Bengal, in lat. 16° 4' n., and long. 97° 40' e., at the entrance of the Martaban or Saluen. In 1826, the province having been newly ceded by the Burmese, *A.* was founded, after a special survey of all the available sites, as the commercial capital, being named after the then governor-general of India, and proclaimed to be an asylum for the neighboring Peguers, still subject to Burmah; but policy, prestige, and foresight alike have in some measure failed; for the harbor, otherwise commodious enough, labors under two serious defects—difficulty of access, and exposure to the s.w. monsoon. Even in trade, *A.* has been distanced by Moulmein, selected at first merely to be the military station of the territory. It is of no commercial importance except as a pilot-station and occasional port of call.—The district of *A.* has an area of 15,144 sq. m., and a pop. of (1872) 235,738.

AMHERST, JEFFERY, Baron, 1717–97; a British general; present at Fontenoy on the staff of gen. Ligonier, and sent to America in 1758 with the rank of major-general. With Wolfe and Prideaux he conquered all the strongholds of the French in Canada, for which he was thanked by the House of Commons, and granted the order of K.B. Soon afterwards he was made commander-in-chief of the English forces in America; in 1763 he was appointed governor of Virginia, and in 1770 governor of the islands of Guernsey. In 1772–82 and 1793–95 he was commander-in-chief of the British armies, but, being superseded by the duke of York, he was made a field-marshal. In 1776, he was made a peer as baron Amherst of Holmesdale, and in 1787 was patented baron Amherst of Montreal.

AMHERST, WILLIAM PITT, Earl of, 1773–1857. In 1816, he was sent ambassador to China where he refused to perform what he thought a degrading act of kneeling, called *ko-tou*, which was required of all who would see the emperor. For this he was not allowed to enter Peking, and the object of his mission was frustrated. On the way home he was wrecked. Another ship in which he returned to England touched at St. Helena, where he had several interviews with Napoleon. He was governor-general of India, 1823–28, and was created earl in 1826.

AMHERSTBURG, a t. on the river Detroit, which empties lake St. Clair into lake Erie. It is one of the oldest settlements in upper Canada, being named from lord Amherst, who, by the capture of Montreal in 1760, completed what general Wolfe had begun at Quebec in 1759. It occupies the s.w. extremity of the province, the turning-point of climate and character to the basin of the St. Lawrence, the spot where its waters, after having gained southing from the 50th to the 42d parallel, suddenly assume a direction which carries them back to their original latitude above the island of Anticosti. Pop. '71, 1936. A large business is done here in timber.

AMHERST COLLEGE, in Amherst, Hampshire co., Mass., was founded, 1821, by Congregationalists. Its declared object was, *pro Christo et ecclesia*, the education of young men for ministerial and missionary labor. It holds funds which amount to nearly \$100,000, whose income is distributed among indigent students who have the ministry in view. Its 12 college buildings have cost \$300,000. Its laboratories, museums of science, archaeology, and art, and its library, contain collections valued at about \$150,000. The entire property under its control is about \$1,100,000, and its annual income from funds and fees is about \$65,000. To its funds the state contributed \$50,000; the

remainder has come from private munificence. The largest donations were \$250,000 by William J. Walker; \$175,000 by Samuel A. Hitchcock, and \$150,000 by Samuel Williston. The college church, a beautiful gothic edifice, was the gift of William A. Stearns, Jr., son of the late president. The library has 41,000 volumes. The notable collections are: the Hitchcock collection of ichnology; the Shepard collection of minerals and a remarkably full collection of meteorites; the Woods collection of geology; the Adams collection of conchology; the collection of physical apparatus, much of it the work of professor E. S. Snell, during more than 50 years of continuous labor; the gallery of fine art; the Nineveh gallery; the museum of Indian relics. The Barrett gymnasium, as managed, is a feature peculiar to the institution. All students join in its exercises, under the professional direction of the professor of hygiene and physical culture. The faculty numbers 25 persons; there are 350 undergraduates, and 2546 alumni. The presidents have been, Zephania Swift Moore, D.D., 1821-23; Heman Humphrey, D.D., 1823-45; Edward Hitchcock, D.D., LL.D., 1845-54; William A. Stearns, D.D., LL.D., 1854-76; Julius H. Seelye, D.D., LL.D., 1876, the present incumbent.

**AMICE**, or **AMICT**, a vestment in the Roman Catholic service worn during mass. It is a square linen cloth laid over the neck and shoulders, originally a protection for the throat, but adopted as an emblem of the cloth wherewith the Saviour was blindfolded before his crucifixion. In ancient Rome, the A. was an upper garment worn over the tunic.

**AMICI**, GIOVANNI BATTISTA, 1784-1863; celebrated as an improver and maker of astronomical instruments. He was the first to make elliptical specula to prevent spherical aberration. He is well known for microscopes with compound achromatic object glasses. After being professor of mathematics in Modena, he was, in 1831, appointed inspector-general of the studies of the duchy, and, a few years later, had charge of the observatory at Florence, where he lectured on mathematics in the museum of natural history.

**AMIDAS**, PHILIP, 1550-1618; an English explorer. He commanded one of the two ships sent by queen Elizabeth under Arthur Barlow to N. America, coasting up from Florida, and July 13, 1584, entering Ocracoke inlet, North Carolina, of which country he gave a most favorable description. The queen called the new land "Virginia." Amidas was long afterwards in the English marine service.

**AMIDES** are a group of organic compounds, derived, under certain conditions, from ammonia ( $\text{NH}_3$ , or  $\text{NHHH}$ ), by the exchange of one or more atoms of hydrogen for a corresponding number of atoms of a metal, or a compound radical. The first of these compounds that was discovered was that in which one atom of hydrogen was replaced by one of potassium ( $\text{NHHK}$ , or  $\text{NH}_2\text{K}$ ), the resulting product being regarded as a compound of  $\text{NH}_2$  (*amidogen*) with potassium, and being termed amide of potassium. At present, the term *amide* is restricted to the case in which one or more atoms of hydrogen are replaced by an *acid* radical, and the amides are called primary, secondary, or tertiary, according as one, two, or all three of the atoms of hydrogen are replaced by the acid radical. The primary amides may be obtained in various ways, of which we shall mention two: (1.) If we heat an ammoniacal salt, two atoms of water are given off, and the amide corresponding to the acid is left; thus, acetate of ammonia ( $\text{NH}_4\text{O.C}_2\text{H}_3\text{O}_2$ ) water ( $\text{H}_2\text{O}_2$ ) = acetamide  $\{ \text{C}_2\text{H}_5(\text{NH}_2)\text{O}_2 \}$ , which, expressed typically, is —

$\begin{matrix} \text{H} \\ | \\ \text{N} \\ | \\ \text{H} \end{matrix} \left\{ \begin{matrix} \text{C}_2\text{H}_5\text{O}_2 \\ \text{H} \end{matrix} \right\}$  N, where  $\text{C}_2\text{H}_5\text{O}_2$  is the radical of acetic acid. (2.) If an anhydride is submitted to the action of ammonia, there are simultaneously formed an amide and an ammoniacal salt. Thus, valerianic or valeric anhydride ( $\text{C}_{10}\text{H}_9\text{O}_2$ ) + ammonia ( $\text{NH}_3$ ) = valerate of ammonia ( $\text{NH}_4\text{O.C}_{10}\text{H}_9\text{O}_4$ ) + valeramide  $\{ \text{C}_{10}\text{H}_9(\text{NH}_2)\text{O}_2 \}$ , which, expressed typically, is

$\begin{matrix} \text{H} \\ | \\ \text{N} \\ | \\ \text{H} \end{matrix} \left\{ \begin{matrix} \text{C}_{10}\text{H}_9\text{O}_2 \\ \text{H} \end{matrix} \right\}$  N, where  $\text{C}_{10}\text{H}_9\text{O}_2$  is the acid radical of valeric acid. The amides are, for the

most part, capable of being obtained in a crystalline form, and are fusible volatile bodies. For a description of the more complicated forms of amides, and for a history of their general properties, the reader is referred to the article "Amides" in Watts's *Dictionary of Chemistry*, and to the chapter on Amides in the 2d edition (1867) of Naquet's *Principes de Chimie*, vol. ii. pp. 344-368. If, in place of an *acid radical*, a *base radical* replaces one or more atoms of hydrogen in ammonia, a class of compounds, termed *amines*, is formed, whose composition is noticed in the article ORGANIC BASES.

**AMIDOGEN** is a substance procured by the action of the metal potassium on dry gaseous ammonia. The latter contains one atom of nitrogen to three atoms of hydrogen ( $\text{NH}_3$ ), whilst A. contains one to two ( $\text{NH}_2$ ). A. forms a very important class of organic compounds called *amides*, and gives rise to a number of substances closely allied to the alkaloids, many of which, indeed, may be regarded as natural amides.

**AMIENS**, an ancient c. in the plain of Picardy, and capital of the department of Somme, it is the seat of a bishop and of a court of justice, and has a citadel and fortifications. It possesses a college, an academy, a theological seminary, an industrial school, a school of medicine, a public library, a picture-gallery, a botanical garden, and several

literary and scientific institutions. Among its public buildings, the cathedral is a noble edifice, built in 1220, and esteemed a masterpiece of Gothic architecture. Peter the Hermit was born here. A. has considerable manufactures of velvet, silk, woolen, and cotton goods, ribbons, and carpets. But the place owes its celebrity chiefly to the "Peace of A.," a treaty signed in this city, Mar. 27, 1802, by Joseph Bonaparte, the marquis of Cornwallis, Azara, and Schimmelpennink, and intended to settle the disputed points between England, France, Spain, and Holland. By this treaty, England retained possession of Ceylon and Trinidad, and an open port at the cape of Good Hope; France received back her colonies; the republic of the Seven islands was recognized; Malta was restored to the order of the knights of St. John; Spain and Holland regained their colonies, with the exception of Trinidad and Ceylon; the French were to quit Rome, Naples, and Elba; and Turkey was restored to its integrity. These terms were not received with satisfaction by the English, and war was declared against Bonaparte in 1803. In the Franco-Prussian war of '70, A. was taken by the German general Manteuffel, an event which contributed to the fall of Paris. Pop. '76, 61,606.

AMIOT, or AMYOT, JOSEPH, 1718-94; a Jesuit missionary in China who resided in Peking 44 years; spending the time in the study of the Chinese and Tartar literature, and doing more than all men before had done to acquaint Europe with the knowledge and thought of the Mongolians. Many of his statements were erroneous, but his *Tatar-Manchou-French Dictionary* was a valuable work. He also wrote a full, and, in the main, an accurate *Life of Confucius*, and many essays on Chinese history and science.

AMITE, a co. in s.w. Mississippi, named from Amite river, flowing through it; pop. '80, 13,791—6777 colored. It formerly had 700 sq.m., but has been reduced to form the co. of Lincoln. Its surface is uneven; soil fertile; corn, sweet potatoes, rice, and cotton are produced. Co. seat, Liberty.

AMLETH, or HAMLETH, Prince of Jütland, is said to have lived in the 2d c. b.c. According to Saxo-Grammaticus, he was the son of Horvendill and Gerutha; and after the murder of his father by his uncle Fengo, who married Gerutha, he feigned himself a fool to save his own life. Saxo relates a number of little things regarding A., which are a curious medley of sharp and lively observation, and apparent madness. We are told that, on one occasion, when he visited his mother, suspecting that he was watched, he commenced to crow like a cock and dance idiotically about the apartment, until he discovered, hidden in a heap of straw, a spy, in the person of one of Fengo's courtiers, whom he immediately stabbed; he then so terrified his mother by his reproaches, that she promised to aid him in his intended revenge on his father's murderer, and, according to the old chronicler, really did so. Scandinavian traditions confirm the existence of a prince of this name. A field is still pointed out in Jütland with a tomb bearing the name of A. In the vicinity of Elsinore is shown the spot where the father of A. was assassinated. Saxo himself does not mention the manner or circumstances of his death; but his French translator says that he was murdered at a banquet. Most of the recent historians of Denmark consider the history of A. fabulous, but Müller thinks there is a substratum of fact in the old myth. It is the source of Shakespeare's tragedy of *Hamlet*, and thus possesses a perennial interest for all the civilized world.

AMLWCH, a t. of Anglesey, N. Wales, on the n. coast of the island, 14 m. n.w. from Beaumaris. It stands on a rising ground close to the sea, and consists of one principal street, with diverging streets and lanes. It is a busy but rather dirty t., deriving its importance and wealth almost entirely from the rich copper mines in its vicinity—the mines of the Parys mountain. Copper-smelting is carried on in A., and contributes not a little to make the t. unpleasant. A harbor has been formed by excavation out of the solid slate rock, at the expense of the mining companies, and is capable of receiving vessels of 600 tons burden. It is protected by a breakwater. A branch of the Chester and Holyhead railway terminates at Amlwch. A. is associated with Beaumaris, Holyhead, and Llangefni, in returning one member to parliament. Pop. '71, 2968.

AMMAN, or AMMON, ancient Rabbah, the chief t. of the Ammonites; a ruined city of Syria, in the pashalic of Damascus, 55 m. n.e. of Jerusalem, on a branch of the Jordan. It was captured by king David; afterwards ruined, but rebuilt by Ptolemy Philadelphus and named Philadelphia. As late as 300 A.D., it was prosperous, and had temples and a fine theater. The ancient ruins are extensive.

AMMAN, JOHANN CONRAD, 1669-1725; a Swiss physician, and one of the earliest writers on the instruction of the deaf and dumb. He graduated at Basel, but fled to Amsterdam on account of his religious views. In his work *Surdus Loquens*, which Haller calls *rore aureum*, he describes the process employed by him in teaching, which was principally by fixing the attention of the pupils on the motions of his lips and larynx while he spoke, and inducing them to imitate until they could utter distinct letters and words.

AMMAN, Jost, 1539-91; a Swiss artist of singular productiveness, many of whose works are in the Berlin collection of engravings. He began a series of copperplate portraits of the kings of France, and made many wood-cuts for the Bible. His drawing is correct and spirited, and his costumes are minutely accurate.

**AMMANA' TE**, BARTOLEMEO, architect and sculptor, b. at Florence in 1511, d. in 1593. He was at first a pupil of Baccio Bandinelli, and afterwards of Sansovino at Venice. In 1550, he married Laura Battiferri of Urbino, a lady celebrated for her poetical gifts. Pope Julius III. employed him in the decoration of the capitol, and Cosmo de Medici appointed him his architect. His principal works are, the statues which adorn the tomb of Sannazer at Naples, the tomb of cardinal de Monti at Rome, the bridge of the Trinity and several fountains at Florence. He also completed the Pitti palace, commenced by Brunelleschi, and ornamented the court with three orders of columns, which were subsequently imitated by J. de Brosse in the palace of the Luxembourg at Paris. In the collection of architectural designs in the Florence gallery, there is one by A., exhibiting the plans of different buildings, by which a city may be rendered at once magnificent and convenient. His works have all a certain grandeur of character, derived, probably, from his early admiration of Michael Angelo, but are somewhat marred by a quaint mannerism: His bronzes are executed with great delicacy.

**AMMEN**, DANIEL, b. Ohio, 1820; a rear-admiral. He passed through all grades in the U. S. navy to that of commodore in 1872. He commanded the gunboat *Seneca*, bore a conspicuous part in the battle of Port Royal, Nov. 7, 1861, and was engaged in all the operations of admiral Dupont on the s. Atlantic coast; he was in the attack of the iron-clads on fort Sumter April 7, 1863; was in both attacks on fort Fisher, and was recommended for promotion by rear-admiral Porter. His more recent duty has been as chief of the bureau of navigation.

**AMMERGAU MYSTERY**. See OBER-AMMERGAU, *ante*.

**AMMIANUS MARCELLINUS**, a Roman historian of the 4th c., was present in several campaigns in Gaul, Germany, and the e., and afterwards lived at Rome, devoted to literature. Though a Greek by birth, he wrote in Latin a history of the Roman empire from 91 to 378 A.D., in 31 books, of which 13, containing the years from 91 to 352, are lost. This work, which commenced with the accession of Nerva, may be regarded as a continuation of Tacitus, and though the portions remaining have many faults of style, they are valuable on account of the author's love of truth, his careful descriptions of countries and events from personal observation, and especially his remarks on Germany. After his time, Latin ceased to be employed by any Roman writer in the composition of secular history. The best edition of A. M. is that by Wagner and Erfurdt, in 3 vols. (Leip. 1808).

**AMMIRATO**, SCRIPPO, 1531-1600; an Italian historian. He entered the church, and was in the service of Pius IV., at the suggestion of duke Cosmo I. He wrote a *History of Florence*, histories of great families in Naples and Florence, and discourses upon Tacitus.

**AMMON**, an Egyptian deity, styled Amun on hieroglyphic monuments, was compared by the Greeks with their supreme deity Zeus. The sacred name of Thebes, A.'s city ("No-Ammon") in the Old Testament), was therefore translated into Greek by Diospolis. In the temples of this town, his peculiar residence, A. is represented as sitting on a throne, holding the symbols of life and power, and wearing a crown with a peculiar ornament of two feathers, and a band falling behind and hanging down to his feet. He was especially the god of Thebes; though his temples are found in other places, as at Meroë, and over the whole of Nubia and Libya. The name Amun signifies the hidden, unrevealed deity, and, in Egyptian mythology, he held the highest place. His undefined character may serve to explain how other deities were identified with A. After the 18th dynasty, we find in hieroglyphics the name Amun-Ra frequently inscribed, indicating a blending of A. with the sun-god RA. Similarly, the representation of A. with a ram's head shows the blending of him with Kneph. The worship of A. spread at an early period to Greece, and afterwards to Rome, where he was identified with Zeus and Jupiter. Temples for his worship were erected in Thebes (Bœotia), Sparta, Megalopolis, and other places.

**AMMON**, CHRIS. FRED., a German theologian, b. Jan. 13, 1766, d. May 21, 1850, is chiefly known by his work on the *Development of Christianity as a Universal Religion* (4 vols., Leip. 1833-40), in which he argues in favor of such liberal development of doctrine as may keep theology in harmony with the progress of science. A. was a leader of the rationalist school. He was a man of extensive learning, united with great industry and earnestness, and was generally respected in Saxony, where he resided.—His second son, FREDERICK AUGUSTUS A. (b. 1799, d. 1861), is well known in Germany as the writer of several works on practical medicine and surgery.

**AMMONIA**, HARTSHORN, or the volatile alkali, was one of the few substances known to the chemistry of the ancients; being referred to by Pliny under the name of *vehement odor*, which he evolved by mixing lime with nitrum (probably sal ammoniac). It derives its name A. from its being obtained from sal ammoniac, which was first procured by heating camels' dung in Libya, near the temple of Jupiter Ammon. The atmosphere contains a minute quantity of A., amounting to 210-237 parts in 10,000,000,000 parts of air, which is equal to 1 volume of A. in 28,000,000 of air. It is likewise present in rain-water in variable proportion. The supply of A. to the atmosphere is its evolution during the putrefaction of animal and vegetable substances, during the vinous fermentation, and the combustion of coal. It is likewise present in respired air, and is therefore a product

of the daily wear and tear of the animal system. The principal source of A. at the present time is the destructive distillation of coal, as in gas-making. The materials which pass over from the retort are partly uncondensable and truly gaseous, and these are carried to our gas-jets and burned; but in other parts they are condensable, and are received during the purification of the gas, as a mixed tarry and watery liquid. On allowing this liquid to settle, the water portion, containing A., can be separated, and, hydrochloric acid being added to it, there is formed a compound of A. and hydrochloric acid, called chloride of ammonium, which can be obtained dry, by evaporating the solution down in shallow vessels. Pure A. is manufactured from this impure chloride of ammonium by mixing it with its own weight of slaked lime in a retort, and applying a gentle heat, when the A. as a gas passes over, and is received in a vessel containing water. The solubility of A. in water is very great, 1 volume of water dissolving 670 volumes of ammoniacal gas, increasing in bulk, and forming a liquid (*liquor ammonie* of the chemist, and hartshorn of the shops), which is lighter than water, its density being .875. The solution of A. is transparent, colorless, and strongly alkaline. In taste it is acrid caustic, and in odor very pungent. Applied to the skin in a concentrated form, it blisters. Exposed to the air, the A. escapes, and the solution thus gets weaker, and, reduced to  $-40^{\circ}$  F., it freezes. As generally obtained, even in the gaseous condition, it is in combination with the elements of one atom of water, and contains one of nitrogen, 4 hydrogen, and 1 oxygen ( $\text{NH}_4\text{O}$ ). Dry A. can be procured by passing the vapor of A., as ordinarily obtained, over fused chloride of calcium, when the water is abstracted, and true gaseous A. is left, having the composition 1 nitrogen, and 3 hydrogen ( $\text{NH}_3$ ). Gaseous A. can be liquefied under pressure and cold, and then yields a colorless, clear, mobile liquid, with the characteristic odor and other properties of A. much intensified. A. combines with acids to form a class of salts which are of considerable importance. Thus, the crystallized sulphate of A. ( $\text{HO}, \text{NH}_4\text{OSO}_4$ ) is very extensively used as a top-dressing by farmers, and is also mixed with manures where an increase of ammoniacal matter is desirable. The chloride of ammonium is also employed in agriculture; likewise largely by the Russian peasantry, as a condiment for flavoring food in place of common salt.

In medicine, the gaseous A. has been rarely used. The solution of A. is employed as a means of rousing the respiratory and vascular systems; and of the speedy alleviation of spasm. It is also used as a local irritant and antacid. It is serviceable in dyspeptic complaints with preternatural acidity of stomach and flatulence; to produce local irritation or destruction of certain parts, and to render comparatively harmless the bites of poisonous animals, such as serpents and insects.

AMMONIUM is a hypothetical metal, which is said to consist of 1 volume of nitrogen with 4 of hydrogen. It has never been produced in an isolated state; but a singular amalgam of A. and mercury may be formed, by subjecting a globule of mercury, surrounded by a little water of ammonia, to the action of the galvanic current; when the galvanic agency ceases, this amalgam is decomposed into mercury, ammonia, and water. A. may likewise be prepared by acting on an amalgam of sodium and mercury with a solution of chloride of A. A portion of mercury is slightly heated in a porcelain vessel, and pieces of sodium introduced, when the sodium and mercury combine, and form an amalgam of sodium and mercury, which is a semi-solid substance, and scarcely occupies more space than the bulk of the mercury employed. If this be introduced into a vessel containing a strong or saturated solution of chloride of A. ( $\text{NH}_4\text{Cl}$ ), the chlorine combines with the sodium (Na) of the amalgam, forming chloride of sodium ( $\text{NaCl}$ ), and the A. unites with the mercury, forming the amalgam of A. and mercury. As the change referred to proceeds, the amalgam increases in size many times, and forms a spongy mass of the consistence of butter, which rises through the saline solution and floats on the surface. The amalgam of A. and mercury very readily decomposes, and hence the difficulty of determining its exact composition.

AMMONIACUM, or AMMONIAC, a gum resin, used in medicine on account of its stimulant and discutient qualities, is obtained from *dorema A.*, a plant of the natural order *umbelliferae*, a native of Persia—a perennial, about 7 ft. high, with large doubly pinnate leaves. The leaves are about 2 ft. long. The whole plant is abundantly pervaded by a milky juice, which oozes out upon the slightest puncture, and which hardens, and becomes A. The A. exudes from punctures made by an insect, which appears in great numbers at the time when the plant has attained perfection. Much of it is sent to India, and it is generally imported into Britain from Bombay, although sometimes from the Levant. It occurs in commerce either in tears, or in masses formed of them, but mixed with impurities. It is whitish, becoming yellow by exposure to the atmosphere, is softened by the heat of the hand, and has a peculiar heavy unpleasant smell, and a nauseous taste, at first mucilaginous and bitter, afterwards acrid. It is not fusible, but burns with white crepitating flame, little smoke, and strong smell.—It was for some time erroneously supposed to be the produce of a species of *heracleum*, the seeds of which were found inclosed in it.—A similar substance is obtained from *ferula tingitana*, an umbelliferous plant, growing on light sandy soils in the n. of Africa; and is said also to be obtained from *F. orientalis*, a native of Asia Minor and of Greece. Both these plants have branched stems, and very compound leaves, somewhat resembling fennel. It would seem that the A. of the ancients was the gum resin of the ferula, which has a more faint odor and less powerful medicinal properties than that of the dorema.

**AMMONITES**, a Semitic race of people, living on the edge of the Syrian desert; the descendants of Ben-Ammi, the son of Lot (Gen. xix. 38). They inhabited the country lying to the n. of Moab, between the rivers Arnon and Jabbok, i.e. the desert country e. of Gad. Their chief city was Rabbath-Ammon, to which the Greeks afterwards gave the name of Philadelphia. The Israelites were often at war with them and their other Bedouin confederates. Jephthah defeated them with great slaughter. They were also overcome by Saul, David, Uzziah, and Jotham; but after the fall of the kingdom of Israel (720 B.C.), spread themselves in the districts of Judæa on the e. of the Jordan. In 582 they were subdued by the Babylonians. After the captivity, they recommenced their feuds with the Jews, but were conquered by Judas Maccabeus. The intermarriages of Jews with the A., which had been frequent, were prohibited by Nehemiah. The chief deity worshiped by the A. was named Milcom, who in his character seems to have resembled Moloch. Justin Martyr affirms that in his time the A. were still numerous.

**AMMONITES**, a genus of fossil shells, nearly allied to the recent genus *nautilus*, being, like it, chambered and spiral. The molluscous inhabitant appears to have lodged in the last and largest chamber of the shell, the spaces left behind as it increased in size being successively converted into air-chambers, and all connected by a tube (*siphuncle*), so that the animal could at pleasure ascend or descend in the sea; whilst the transverse plates dividing the chambers gave strength to the whole structure without great increase of weight. A. have long been popularly called *cornua ammonis*, from a fancied resemblance to the horns on sculptured heads of Jupiter Ammon. They are found throughout the entire series of fossiliferous rocks from the transition strata to the chalk. They abound in the cretaceous and oolitic groups. Particular kinds distinguish particular formations, a circumstance which renders them of particular interest and importance to the geologist. The number of species is very great, considerably above 200; and several genera have been constituted, as *bauculites*, *lunulites*, *scaphites*, *turritiles*, forming with *ammonites*, the family of *ammonitidae*. A. are of very different sizes, from a very small size, to 2, or even 3 or 4 ft. in diameter. The larger ones were in former times ignorantly mistaken for petrified snakes; and impositions have been practised upon collectors by adding to specimens nicely carved snakes' heads; whilst the general absence of the heads was popularly accounted for by a legend of a saint decapitating the snakes, and turning them into stone.

**AMMONIUM**, now known as the oasis of Siwah, in the Libyan desert, was in ancient times celebrated on account of the oracle of Ammon, the unfortunate expedition of Cambyses, and the subsequent journeys of Alexander the great and Cato. Besides the temple of Jupiter, placed in the center of a grove of palms, the ruins of which still exist, and which contained an image of the god, composed of smaragdus and other gems, A. was remarkable for the palace of its ancient kings, surrounded by a triple wall, in the very heart of the oasis, and for its "well of the sun," of which the waters were coldest at noonday, and warmest at midnight. Here the emperor Justinian built a Christian church. The length of the oasis is 15 m., by 12 broad; it is about 150 m. distant from the Mediterranean, and is situated in lat. 29° n., and in long. 26° e.

**AMMONIUS SACCAS**, a Greek philosopher, founder of the Neoplatonic school, is said to have been in his early days a porter in Alexandria. His parents were Christian, but he himself is said to have abandoned his early religion, in which he had been instructed by Clemens Alexandrinus, and to have devoted himself to the study of heathen philosophy under Athenagoras; although both Eusebius and St. Jerome deny that he ever formally apostatized from the Christian faith. His great endeavor was to harmonize, through a comprehensive eclecticism, the various philosophical theories which prevailed in the Roman world, especially those of Aristotle and Plato. He also labored to amalgamate with these doctrines of the Magi and Brahmans; but instead of boldly announcing the result as his own, he claimed for his system the highest antiquity. His most distinguished pupils were Longinus, Herennius, Origen, and Plotinus, the last of whom, by far the most subtle and profound of the Neoplatonists, always expressed the highest respect for his master. A. died at Alexandria, 241 A.D. He left no writings behind him.

A. is the name of several learned men in the later periods of Greek history; such as A., the master of Plutarch, who lived during the reign of the emperor Adrian, and, like A. Saccas, taught a species of eclecticism in philosophy; A., the Christian philosopher of the 3d c., who wrote a *Harmony of the Gospels*; A., son of Hermias, a peripatetic philosopher of the 5th c., and disciple of Proclus; A. the famous surgeon of Alexandria, who lived in the time of Ptolemy Philadelphus; and A., the grammarian, who was the first high-priest in an Egyptian temple, sacred to the god Apis, and afterwards (389 A.D.) became teacher at Constantinople, where he had the church historian Socrates for his pupil.

**AMMONOOSUC**, UPPER, and LOWER; small tributaries of the Connecticut river in New Hampshire; the former entirely in Coos co., the latter rising in that co. and running through Grafton, emptying opposite Wells river, Vt. Length, 100 miles. A branch is called the Wild A.

**AMMOPHILA**, a genus of grasses, closely allied to *arundo* (see REED), and distinguished by a spike-like panicle, and by the *glumes* being nearly equal, keeled, longer than

the *paleæ* of the single floret, and surrounded at the base by a tuft of hairs.—*A. arundinacea*, formerly called *arundo arenaria*—a grass about 2 to 3 ft. high, with rigid bluish leaves, the edges of which are rolled in, and very creeping roots—is frequent on the sandy sea-shores of Britain and the continent of Europe. It is sometimes called SEA REED or SAND REED, and sometimes MAT GRASS, the culms being wrought into foot-mats, coverings for stairs, etc., in the manufacture of which many families residing along the coast of Ireland are employed most of the year. It is also called *marum*, *marrum*, or *marram*, by which name it is designated in laws both English and Scottish, by which the destruction of it was prohibited under severe penalties, because of its great utility in fixing the shifting sand. In Holland and in Norfolk, it is extensively employed—along with the sea lyme grass (q.v.)—in preserving the banks of sand which prevent the inroads of the sea. It is of little value as food for cattle, although they eat the very young leaves. The fiber has been used instead of flax, but is too short.

**AMMUNITION.** Sometimes this name is given to cannon and mortars, as well as to the projectiles and explosive substances employed with them; but more usually *A.* is considered to apply to the latter—such as shot, shell, gunpowder, cartridges, fuses, wads, grenades. Muskets, swords, bayonets, and other small arms are sometimes, but improperly, included under this term. The royal laboratory at Woolwich is the place where *A.* is chiefly prepared for the British army and navy. The cannon-balls may be cast at some of the great iron foundries in the north; the shells may be cast or forged in the shell-factory at Woolwich; the muskets may be made at Birmingham, and the rifles at Enfield; the bullets at the shot-factories; the gunpowder at Waltham abbey—and so on; but the “making up” of the *A.* is mostly conducted at the establishment above mentioned. Pags of serge, in enormous number, are cut out and made, and filled to form the cartridges for large ordnance. Bags or tubes of paper are made and filled to constitute blank cartridges for small arms; while the ball-cartridges are inclosed in thin copper cylinders. The tubes and combustibles for war-rockets and fuses are also manufactured. The cartridges for small-arms (rifles, muskets, carbines, and pistols) are made in millions; since it is on those that the main offensive operations of an army depend. It has been calculated by the Woolwich authorities, that a British army of 60,000 men, comprising a fair average of infantry, cavalry, artillery, and engineers, ought to be provided with no less than 18,000,000 ball-cartridges for small-arms, for six months’ operations. These would require 1000 *A.* wagons, and 3600 horses, to convey them all at once. It is therefore deemed better that, under any such circumstances, there should be established *entrepôts* for supplying the troops from time to time. The wagons constructed for this kind of service will carry 20,000 rounds of small-arm *A.* each; the cartridges are packed in boxes, and the wagons are drawn by four horses each. Several wagons are organized into an “equipment,” under the charge of a detachment of artillery; and there are several such equipments for an army of the magnitude above mentioned—one for each division of infantry, a small portion for the cavalry, and the rest in reserve. It has been laid down that an army of 60,000 men ought to have 2,680,000 cartridges *with them*, besides those in reserve; and that the conveyance of such a quantity, with a few forges and stores, would require 150 *A.* wagons, 830 men, and 704 horses. The equipment would return to the *entrepôt* for a new supply when needed. In the peninsular war, and at Waterloo, the English used two-horse carts, carrying about 10,000 rounds of small-arm *A.* each; but a superior kind of wagon has been since introduced. In the field, an infantry soldier usually carries about 60 rounds, put in compartments in his pouch. When the word *A.* is used in connection with artillery matters, the “fixed” *A.* comprises the loaded shells, cartridges, and carcasses; whereas the “unfixed” are the unfilled case-shot, grape-shot, and shell. During peace, the Woolwich laboratory serves out little less than 1,000,000 lbs. of gunpowder annually, in *A.* for the army and navy, for purposes of exercising, saluting, etc.

The chief kinds of *A.* will be found briefly described under their proper headings.

**AMNESTY** signifies an act of pardon or oblivion, and the effect of it is that the crimes and offenses against the state, specified in the act, are so obliterated that they can never again be charged against the guilty parties. The *A.* may be either absolute, or qualified with exceptions. Instances of the latter are to be found in ancient and modern history: thus, Thrasybulus, when he overthrew the oligarchy in Athens, caused an *A.* to be proclaimed, from the operation of which the thirty tyrants, who had formed the oligarchy, and some few persons who had acted under them, were excluded. Again, Bonaparte, on his return from Elba in 1815, issued a decree, which was published at Lyon, declaring an *A.*, from the benefits of which he excepted thirteen persons whom he named. And in our own country, the historical reader will be able to recall the act of indemnity passed upon the restoration of Charles II., by which the persons actually concerned in his father’s execution were, as a class, excluded from the *A.*

**AMNESTY** (*ante*). In the absence of specific statutes on the subject, the exercise of *A.* in the United States was assumed to lie with the president. Washington, without participation by congress, granted *A.*, or pardon, to persons who took part in the “whisky rebellion.” John Adams proclaimed full pardon of those engaged in the house-tax insurrection, and Madison did the same in the case of the Baratania pirates. During the rebellion, Lincoln and Johnson issued four or five proclamations of *A.*, one of

the latest being so broad in its conditions that it raised in congress the question whether the president had the right to such action, and the judiciary committee of the senate, in Feb. 1869, decided that he had not. "A." is so closely connected with "pardon," and "reprieve" that it is difficult to distinguish them. In one message president Lincoln asserted his exclusive authority under the constitution, and his independence of congress in respect to the pardoning power, even more emphatically than in the proclamation. In 1862, congress had passed an act giving full power to the president, but he considered the act unnecessary, claiming that the constitution gave him the necessary authority. Then, in 1867, the act of 1862 was repealed; and all A. proceedings were remanded to their original basis in the second article of the constitution, until further defined in later amendments. The supreme court had decided in the case of Garland that for pardon the president's power was perfect; yet that is not held to include general amnesty. But in 1868 the fourteenth amendment to the constitution, prohibiting rebels from holding certain offices unless their disabilities should first "be removed by a vote of two thirds of each house," seemed to diminish the range of executive authority. Still, the supreme court has held in several cases to the absolute power of the president to grant amnesty and pardon, and that neither congress nor any authority less than an express change of the federal constitution can reverse, abridge, or direct that power. The court, through chief justice Chase, says: "It is the intention of the constitution that each of the great co-ordinate departments of the government, the legislative, the executive, and the judicial, shall be in its sphere independent of the others. To the executive alone is intrusted the power of pardon, and it is granted without limit. Pardon includes amnesty. It blots out the offense pardoned, and removes all its penal consequences."

**AMNION** is the membrane which immediately invests the embryo, appearing very early in the development of the latter, and adhering closely to it. As gestation proceeds, this membrane secretes from its inner surface a fluid which separates it from the foetus. This fluid, the liquor amni, consists of water, with albumen, salt of soda, and extractive matters in solution; it has a specific gravity of 1008. It supplies nutriment to the foetus, preserves around it an agreeable temperature, and when gestation is completed, by projecting the membrane through the os uteri, is the primary agent in opening the way for the foetus. At this time, the A. is thin and transparent, slightly flocculent on the side next its enveloping membrane, the chorion, but smooth on the surface next the foetus. Within it, the latter is suspended in the fluid which not only serves the purposes just mentioned, but protects it from injury. For further particulars, see EMBRYO, and for many curious superstitions connected with the subject, see CAUL.

**AMEBA DIFFLUENS**, one of the lowest animal structures; a gelatinous mass, rounded in form, capable of emitting and retracting processes and lobes from all parts of the body. It abounds in fresh-water ponds, and is known as *proteus*. Except a small pulsating space, it seems to be a formless mass of *sarcode*.

**AMOL**, a t. of Persia, in the province of Mazanderan, on the Heraz, a river which flows into the Caspian sea; 76 miles n.e. from Teheran. The t. is unwall'd, but has good bazaars, and is a place of considerable prosperity and wealth. The river, which is powerful and rapid, is crossed by a bridge of twelve arches. Extensive ruins indicate the former importance of A. Its most notable building is the mausoleum of Seyed Quam-u-deen, king of Sari and A., who died in 1378. In the suburbs are a grand palace, which once belonged to Shah Abbas, and three towers, said to have been temples of the ancient Guebres, or fire-worshippers. The inhabitants of A. cultivate rice and cotton, or are employed in the iron forges and cannon foundries of the district. The pop. in winter, when greatest, is estimated at 35,000 or 40,000; in summer, many of the inhabitants retire to summer residences in the mountains, which approach within about five or six miles of the town on the south.

**AMOMUM**, a genus of plants of the natural order *scitamineæ* (q.v.) or *zingiberaceæ* distinguished by perennial stems; the flowers in close heads resembling cones, not upon the leafy stems, but arising by themselves from the root, and little elevated above the ground; the corolla without inner lateral lobes, and with a very large flat lip, the filament flat, extended beyond the anther, with two lateral lobes, and an emarginate middle lobe. It contains a number of species, natives of tropical countries, and almost exclusively of the eastern hemisphere, of which several yield the **CARDAMOMS** (q.v.) of commerce, and several the spice known by the name of **GRAINS OF PARADISE** (q.v.). The genus A. was formerly more extensive, and included species now forming the genus *zingiber* (see GINGER), etc.

**AMONTONS, GUILLAUME**, 1663-1705; a French philosopher. Illness in youth left him partially deaf, and he turned his attention to machinery and the discovery of perpetual motion, going on to the invention and improvement of various mechanical appliances, among them a hydrometer which was highly approved by the Paris academy of sciences, of which he afterwards became a member. In France, A. is considered the inventor of the telegraph; and, almost at the same time with Halley in England, he found that the boiling point of water varies with the elevation.

**AMOOB'**, or **AMUR**, a river formed by the junction (about lat. 53° n., and long. 120° e.) of the Shilka and the Argoun, which both come from the s.w.—the former rising in Russian Siberia, near the head-waters of the Yenisei; and the latter in Chinese Tartary, not far from the sandy plateau of Kobi. From this starting post, the A. presents, on its right, a tolerably symmetrical curve, which, after receiving, at its most southerly point, the Songari from beyond the wall of China, besides other considerable feeders on both sides of either segment, enters, on nearly its original parallel, the gulf of Saghalien, about a degree below the sea of Okhotsk, properly so called. Great additions have been made to our knowledge of this large and important river within the last few years. It has been ascertained that its basin comprehends about 766,099 sq. m., and that its course has a length of about 2500 miles. Steam-boats of light draught ascend it as high as Ust Strelka, at the junction of the Shilka; and that river is navigable for boats to the foot of the Yablonoi range in eastern Siberia, part of which lies in the basin of the A. The Russians, after conquering Siberia in the 16th c., turned their attention immediately to the advantages which the possession of this river offered. The territory and the people had always been in possession of China—the people sometimes tributaries, at other times conquerors. From as early as 1636, Russian adventurers made excursions into the Chinese territories of the lower A. In 1666, they built a fort at Albazin, and succeeded in navigating from that fort to the mouth of the river. In 1685, the fort was taken and destroyed by the Chinese, but was retaken promptly by the Russians, who, however, abandoned it and the whole of the A. to the Chinese. But Russian writers did not cease to keep alive in the minds of their fellow-subjects that the lower A. belonged to them; and the fur-hunters of Siberia, encouraged by government, continued to pursue their vocation on Chinese ground. In 1854-56, two military expeditions were conducted by count Muraviev, who twice descended the A. from the mouth of the Shilka, unopposed by the Chinese. This was during the Crimean war. On the arrival of news of peace, the Russians were left to strengthen their positions at the mouth and other parts of the A. In 1857, count Putiatin endeavored in vain to obtain from China concessions on the river in favor of Russia. In 1858, the war between the former country and Great Britain and France induced China to agree to the treaty of Tientsin, by which the boundaries of Russia and China were defined. Several towns were, as the result, established by the former of these two powers on the left bank of the A., of which the largest are Khabarooka and Sofyensk; and an A. trading company was established. In 1860, after the occupation of Peking by the British and French, in less than a month after lord Elgin and baron Gros had affixed their signatures to the peace conventions at Peking, gen. Ignatieff secured the signature of prince Kung to a treaty, by which Russia acquired the broad and wide territory comprised between the river A. and the mouth of the Tumen, extending 19° of lat. nearer the temperate regions, and running from the shore of the north Pacific eastward to the banks of the river Ussuri, a principal affluent of the A. An enormous advantage to Russia of this acquisition of territory was the fact that it conferred on that country the advantage of harbors on the Pacific in a comparatively temperate latitude, where navigation is impeded by ice for at most 3 or 4 months a year. The bay of Passkett, to the s. of this region, lying at a point where the Russian, Chinese, and Korean frontiers adjoin each other, possesses a large trading town and a military station; 60 or 70 m. n. is situated the important harbor of Vladivostok ("rule of the east"), or port May, which, in 1872, was placed in telegraphic communication with Europe by the China submarine cable, and is now the capital of the A. provinces. The island of Saghalien (q.v.), lying immediately n. of the Japan group, along a portion of the coast of Asiatic Russia, and formerly possessed partly by that government and partly by Japan, was recently taken entire possession of by the unscrupulous aggressive power which has so stealthily and silently acquired the adjacent A. provinces.

**AMORETTI, CARLO**, 1741-1816; an Italian author. He joined the order of St. Augustine, and was professor of common law in the university of Parma. In 1772, he entered the ranks of the secular clergy. He was curator of the Ambrosian library in Milan, 1797, and the first to give the world knowledge of its treasures, from which he published a collection of voyages. He wrote a life of Leonardo da Vinci, and treatises on natural science, familiarizing Italians with the scientific status of other nations.

**AMORETTI, MARIA PELLEGRINA**, 1756-87; niece of Carlo A. At the age of 16 she argued in public on scientific topics, and afterwards studied law, graduating from the university of Pavia. She wrote a treatise on Roman law.

**AMORITES**, a powerful nation, of Canaan, extending on both sides of the Jordan. They were vanquished by the Hebrews under Moses, and their lands beyond Jordan were distributed among the tribes of Gad, Reuben, and Manasseh. Their two most famous kings were Sihon, king of Heshbon, and Og, king of Bashan. Og was the last of the giants, or at least of that gigantic race, the Rephaim. In Deut. iii. 11, his iron bedstead is mentioned as measuring 13½ ft. in length; but the whole of this verse, with the exception of the first clause, is considered by some an interpolation. The Rabbins hold this bedstead to have been Og's cradle, and affirm that his full-grown stature was 120 ft.! Joshua subdued, but did not wholly exterminate, the Amorites in Canaan. The residue of this people became tributary under Solomon. (Gen. x. 15-20; xv. 19-21; Numb. xiii. 29; xxi. 13; Deut. xx. 16; xii. 31; Joshua, ix.)

**AMORO'SO**, in music, affectionately, tenderly.

**AMOR'PHA**. See **INDIGO**.

**AMORPHOPHAL'US**. See **ARUM**.

**AMORPHOUS** (Gr., *a*, priv., *morphe*, form), shapeless. In chemistry, the term *A.* is used to describe the uncrystallized, in opposition to the crystallized, condition of bodies. There are substances which, in certain conditions, are capable of crystallization, but, in other conditions remain *A.* Thus, pure sugar contains carbon, which appears as an *A.* substance after the sugar has been burned in a platina crucible. The same substance, carbon, appears in its crystallized form in the diamond.

**AMOS**, the Hebrew prophet, was a herdsman of Tekoa, in the neighborhood of Bethlehem, and also a dresser of sycamore trees. During the reigns of Uzziah in Judah, and Jeroboam in Israel (about 784 B.C.), he came forward to denounce the idolatry then prevalent. His prophetic writings contain, in the first six chapters, denunciations of the divine displeasure against several states, particularly that of Israel, on account of the worship of idols. The three remaining chapters contain his symbolical visions of the approaching overthrow of the kingdom of Israel, and lastly a promise of restoration. The style of *A.*, remarkable for its clearness and picturesque vigor, abounds with images taken from rural and pastoral life. The canonicity of the book of Amos is well attested both by Jewish and Christian authorities.

**AMOS, BOOK OF**, has a place among the writings of the prophets, undisputed by the Jews, and twice affirmed in the New Testament. It is not made up of detached predictions, but is logically and artistically connected in its several parts, and is evidently the mature production of the single author whose name it bears. Nothing is certainly known concerning him besides what he relates of himself—that he was of Tekoa, in Judea, a herdsman and cultivator of sycamore fruit, until the Lord called him away from these employments to prophesy unto Israel. Jerome, applying to him words which Paul used concerning himself, calls him “rude in speech, yet not in knowledge.” Some modern critics have adopted this view, but Bishop Lowth, with good reason, rejects it; thinking “that the shepherd seer is not at all inferior among the prophets. As in sublimity and magnificence he is almost equal to the greatest, so in splendor and elegance of diction he is scarcely below any.” *A.* prophesied during the reigns of Jeroboam II., king of Israel, and Uzziah, king of Judah, two years before the earthquake which Zachariah, 800 years afterwards, describes as having caused great alarm among the people. The prophecy of *A.* preceded Isaiah's, to which, and to those of the prophets generally, it serves, in some degree, as an introduction, uttering briefly many predictions which they give more at length. Before his time Israel and Judah had been greatly oppressed by the surrounding nations; but having been relieved, they were then, like their neighbors, living in idolatry, luxury, avarice, and cruelty to the poor. Therefore *A.* was commanded to denounce judgments against them all. His prophecy has been compared to a thunder-storm, rolling over the surrounding kingdoms, touching Judah in its progress, pouring the fullness of its power on Israel, and passing away with a bright rainbow on its cloud. The book is accordingly divided into three parts. I. *Judgments against the neighboring nations*. (Chapters i. 3-15; ii. 1-3.) 1. *Syria*; the fulfillment of which, more than half a century after the prediction, is recorded (II. Kings, xvi. 9). 2. *Philistia*; fulfilled (II. Kings, xviii. 8) a century after. 3. *Tyre*; the fulfillment of which was commenced by Nebuchadnezzar, and continued at intervals, until comparatively modern times. 4. *Edom*; the fulfillment of which, in a great measure delayed until the Mohammedan invasion, was soon after that complete. 5. *Ammon*; the destruction of whose great city, Rabbah, is especially foretold. This city, after it had experienced varied fortunes, the Moslems found in ruins, still remarkable, even in the east, for their extent and desolation. 6. *Moab*; of which the palaces of Kirioth are specified as doomed to be destroyed. Of this city, as one of many, modern travelers say, “The ruins are of great extent, with traces of many public buildings, broken columns, private dwellings having low roofs, colossal walls, and massive stone doors. Over these and all the surrounding plains desolation reigns supreme.” II. *Judgments against Judah and Israel*. (Chapters. ii. 4-ix. 10.) 1. *Judah* (ii. 4, 5); fulfilled, first, by Nebuchadnezzar, about 200 years after the prediction; and, finally, by the Romans, nearly 700 years later still. 2. *Israel* (ii. 6-ix. 10); (1) General reproof for their aggravated sins against God, ii. 6-16. (2) Judgments denounced and the causes of them declared, iii. (3) Remonstrance, five times repeated, against their disregard of former visitations, iv. (4) Lamentation over their approaching ruin, with an earnest exhortation, five times repeated, to seek the Lord that they might even yet be saved, v. 1-24. (5) In view of their continued transgression, notwithstanding the divine forbearance and care, their captivity and inevitable destruction are declared, with the exception, explicitly pledged, that the judgments shall have an end, 5, 25-ix. 10. III. *The coming of the Messiah is promised, with the admission of the Gentiles to his kingdom, and the final restoration of Israel*, ix. 11-15.

**AMOSKEAG**, village. See **MANCHESTER**, N. H., *ante*.

**AMOY**, a seaport t. of China, in a small island of the same name, in the province of Fu-kien, on the sea-coast, lat. 24° 10' n., long. 118° e. It is an important commercial

emporium of the east, and contains a population estimated at 250,000. It is divided into an outer and inner t., and has an outer and inner harbor, the entrance to the former of which, as well as the inner t. itself, is fortified. A. has been celebrated as a trading t. for more than a thousand years, and was one of the earliest seats of European commerce in China. The Portuguese had establishments here in the 16th, and the Dutch in the 17th centuries. In 1841, it was taken by the British; by the treaty of Nanking, a British consul and British subjects were permitted to reside there. The trade is now open to all nations. The chief imports are rice, cotton-twist, British long cloths, beans, peas, etc.; the exports are tea, sugar, paper, grass-cloths, gold-leaf, etc. In 1877, the value of the imports was £1,104,200; the exports being £953,000. About 1000 vessels, exclusive of Chinese junks, entered and cleared the port. Smuggling is carried on extensively. A. was pillaged by the Tae-ping rebels.

AMPELOPSIS, a genus of vine-like woody plants; including Virginia creeper, or American woodbine. It is better adapted than ivy to our climate, and more rapid in growth. In autumn the dying leaves are of most brilliant red and yellow. Order, *viticaceæ*.

AMPERE, ANDRÉ MARIE, a distinguished mathematician and naturalist, was b. at Lyon, Jan. 20, 1775. The death of his father, who fell under the guillotine in 1793, made a deep and melancholy impression on the mind of young A., who sought for solace in the study of nature and antiquity. In 1805, after he had been engaged for some time as private mathematical tutor at Lyon, he was called to Paris, where he distinguished himself as an able teacher in the Polytechnic school, and began his career as an author by his essay on the mathematical theory of chances (*Sur la Théorie Mathématique du Jeu*). In 1814, he was elected as a member of the academy of sciences; and in 1824, was appointed as professor of experimental physics in the collège de France. He d. June 10, 1836. Scientific progress is largely indebted to A., especially for his electro-dynamic theory and his original views of the identity of electricity and magnetism, as given in his *Recueil d'Observations Electro-dynamiques* (Paris, 1822), and his *Théorie des Phénomènes Electro-dynamiques* (Paris, 1830). These researches prepared the way for the experiments of Dr. Faraday. Several of A.'s writings may be found in the *Annales de Physique et de Chimie*.

AMPERE, JEAN JACQUES ANTOINE, son of the above named, professor of modern literature in the collège de France, at Paris, and member of the French academy, was b. at Lyon, Aug. 12, 1800. He acquired a brilliant reputation on account of the keen and searching character of his manifold literary efforts. After laying the groundwork of his comprehensive studies in Paris, he proceeded to Italy, Germany, and Scandinavia. In 1829, when he returned from his travels, he saw no prospect of becoming a professor in Paris, and so consented to give a course of lectures on the history of literature at Marseille. After the July revolution, he succeeded Andrieux as professor in the collège de France, and also took the place of Villemain in the normal school. In both chairs he taught with great success. He was especially versed in the knowledge of German literature; while his valuable writings upon China, Persia, India, Egypt, and Nubia, as well as his Levantine voyages, proved that the far east itself was embraced within the circle of his studies. A. allowed many of his linguistic and historico-literary investigations to see the light first in reviews, especially the *Revue des Deux Mondes*. In 1833, he published an essay on the relations of French literature to that of other countries in the middle ages; in 1841, an *Essay on the Formation of the French Language*—a most valuable contribution to philology in general; and in 1850, a work entitled *Greece, Rome, and Dante*, which shows his acquaintance with classical and south-European literature. Many of his papers for periodicals have been collected under the title *Littérature et Voyages* (2 vols., Paris, 1834). Deep research and judicious criticism, expressed in a clear and classical style, distinguish his various compositions. He d. March 27, 1864.

AMPHIARA'US, a legendary son of Oicles and Hypermnestra, known as a prophet, and famed for valor in the Argonautic expedition and the Calydonian hunt, especially renowned in the war of the Seven against Thebes, into which he was forced by the treachery of his wife, a sister of Adrastus, the king of Sicyon who planned the war to restore Polynices to the Theban throne. A. lost his life; but he was deified, and believed to give oracles. Festivals were made in his honor. The ruins of a temple to A. still exist in the ancient Oropia.

AMPHIBIA, in the Linnæan system of zoology, a class containing reptiles and cartilaginous fishes. The term *amphibious* (Gr., having a double life) had been previously employed, as it still popularly is, to denote animals capable of sustaining existence for a considerable time either on dry land or in water. Of the animals of the Linnæan class, however, some only are capable of this, whilst some are strictly limited to the one element, and some to the other, and only a very few are truly amphibious, or adapted by the possession of lungs and gills at the same time for breathing either in air or in water. The Linnæan classification was soon altered by the removal of the cartilaginous fishes from the class amphibia, and the name was retained for a class consisting of reptiles alone—the *reptilia* of Cuvier. See REPTILES. Some recent naturalists have divided this into two classes, *reptilia* and *amphibia*, the former having lungs only, the latter having

both lungs and gills; the former including the chelonian, saurian, and ophidian reptiles; the latter only the Batrachian reptiles, or the former order Batrachia. But if it must be admitted that these differ from the other orders more than they do from each other, yet the propriety of separating them as a distinct class has not been universally acknowledged. In this work, the characteristics of the A. in the narrower sense are discussed under the head BATRACHIA.

**AMPHICTYONIC COUNCIL.** This central politico-religious court of several Grecian tribes was held twice a year. In spring, the members assembled in the temple of Apollo, at Delphi; in autumn, in the temple of Ceres, at the village of Anthela, near Thermopylae. Their purpose was twofold: 1. To determine questions of international law; 2. To preserve the religious institutions of the Greeks. As there were many amphictyonies in the early days of Greek history—of which, however, by far the most important was that which forms the subject of our article—it has generally been supposed that they originated out of a desire for social union, and were, consequently, a result of the national instinct for civilization. Like the Olympic games of a later period, their tendency was to develop a spirit of brotherhood where it was greatly required. The restless Greek intellect, in its application to political life, had naturally an excessive and perilous love of individualism, out of which rose the numerous strifes and animosities of the various states. These councils, on the other hand, were calculated to exert a wholesome centralizing influence. They knit together, for a time, the distracted tribes in a bond of common interest and piety. Like the Olympic games, too, they became the occasion of vast gatherings of the Greek peoples, who crowded thither for every variety of purpose, sacred and secular; and thus a feeling of unity and pure national patriotism was, temporarily at least, excited in the popular mind. The special origin of the A. C. or league is unknown, though we know that it was composed of twelve tribes. The ancient writers differ in the names of these; but the list given by the orator Æschines, though containing only eleven, is perhaps the safest to adhere to: the Thessalians, Bœotians, Dorians, Ionians, Perrhaebians, Magnetes, Locrians, Ceteans, Phthiotis, Malians, and Phocians. Probably the remaining tribe was the Dolopians, who are mentioned in other accounts. It has been justly concluded that the great preponderance of the northern tribes, who were of the old Pelasgic race, proves the antiquity of the council. It must have been older than the descent of the Dorians upon the Peloponnesus, or the emigration of the Ionians to the coasts of Asia Minor. Each of the twelve tribes sent to the A. C. two members. These 24 representatives possessed equal authority, although some of the tribes were very small, and hardly independent. They bound themselves by an oath that "they would destroy no city of the Amphictyons, nor cut off their streams in war or peace; and if any should do so, they would march against him and destroy his cities; and should any pillage the property of the god, or be privy to, or plan anything against what was in his temple at Delphi, they would take vengeance on him with hand, and foot, and voice, and all their might" (Æschines). It is only right to state, what indeed most people would naturally conclude for themselves, that so excellent an oath was very indifferently kept. In the primitive period of Greek history, it, in all likelihood, exerted the beneficial and civilizing influence of which we have spoken; but it opposed only a feeble check to the passions and ambition of a more powerful age. The members at times connived and even took part in many political crimes, and thus violated their oath. By the time of Demosthenes, the A. C. had ceased to command respect; in the 2d c. after Christ it still existed, but was then just wavering on the verge of extinction.

**AMPHILOCHUS**, in legend, a son of Amphiaraus and brother of Alcmaeon; one of the Epigoni in the Seven against Thebes. He was in the Trojan war, and was one of Helen's suitors. With Mopsus he founded Mallus, and when Mopsus refused him a share in the government, the two fought, killing each other. A. was believed to have prophetic power, and had an oracle at Mallus and an altar at Athens, where, with his father, he was worshiped. There are two other mythological persons of the name, one A.'s grandson, the other a son of Dryas.

**AMPHION**, in mythology, son of Zeus and Antiope, twin brother of Zethus. Both when infants were abandoned on a mountain, but were found and brought up by shepherds. Apollo gave A. a lyre, and he became a singer and musician, his brother being a shepherd and hunter. To avenge their mother's wrongs they captured Thebes, and fortified it by the power of the lyre, to whose music stones moved and fitted into place. A. married Niobe, who bore him many sons and daughters, but all were killed by Apollo. A. killed himself from grief, or was slain by Apollo, for assaulting his temple, and buried with his brother at Thebes. The punishment inflicted by A. upon Dirce for her treatment of his mother (tying her to the tail of a bull and dragging her until she died) is represented in one of the finest works of ancient art—*The Farnese Bull* by Apollonius and Taunicius, found in 1546, and now in the Farnese palace at Rome. There are four other mythical personages named A.

**AMPHIOXUS.** See LANCELET, *ante*.

**AMPHIPOLIS**, a city of Macedonia, built on an island at the mouth of the river Trymon, which flowed almost round the t., whence it derived its name (Gr. *amphi*,

around, and *polis*, a city). In ancient times its position must have been invaluable, as it commanded the only safe entrance from the Strymonic gulf into the broad Macedonian plains. It belonged originally to the Edonians, a Thracian people, and was called, on account of the roads which met here, *Ennea Hodoi* (Nine Ways). The first who attempted to colonize it, Aristagorus of Miletus, was cut off with his followers by the Edonians. The Athenians next tried to gain possession of it. Their first army, amounting to 10,000 men, was utterly cut to pieces at Drabescus, 465 B.C., but their second, 437 B.C., under Agnon, son of Nicias, was successful. The Thracians were expelled, and a new city built, to which Agnon gave the name of A. On account of its situation as an emporium for upper Thrace, and of its neighboring forests of timber for ship-building, A. was an important place. In 424 B.C., it was taken from the Athenians by the Spartan Brasidas, was restored to Athens by the Antalcidean treaty of peace, and afterwards was taken by Philip of Macedon. Under the Romans, it was made the capital of east Macedonia. In the middle ages, it was called *Popolia*. Its site is now occupied by a Turkish t., but a few of its ruins are still visible.

**AMPHISBÆNA**, a genus of *lacertilia*, or lizards, of the general appearance of snakes, or worms, found only in the West Indies and South America. The best known is the sooty or dusky species. The body is 18 to 24 in. long, and nearly the same thickness throughout; head small, tail very short. It lives under-ground, feeding on ants and other small insects. As it moves either way with equal ease, rumor gave it two heads, and asserted that when cut in twain the parts would find each other and reunite. Its dried and pulverized flesh was supposed to possess miraculous curative properties.

**AMPHITHEATER**, a spacious building, generally elliptical in form, used by the Romans for exhibiting gladiatorial combats, fights of wild beasts, and other spectacles. The A. differed from a theater for dramatic performances (*theatrum*) in this, that whereas the theater had only a semicircle of seats fronting the stage, the A. was entirely surrounded by them; and hence the name of A. (Gr. *amphi*, "on both sides" or "all round"). Till a late period at Rome, these erections were of wood, and merely temporary, like a modern race-stand. They seem, however, to have been of enormous size, as Tacitus mentions one, during the reign of Tiberius, which gave way, and caused the death or injury of 50,000 spectators. Amphitheatres of stone had begun, however, to be erected at an earlier period than this, the first having been built at the desire of Augustus. The Flavian A. at Rome, known as the Colosseum, which was begun by Vespasian, and finished by Titus 80 A.D., ten years after the destruction of Jerusalem, was probably the largest structure of the kind, and is fortunately also the best preserved. It covers about five acres of ground, and was capable of containing 87,000 persons. Its greatest length is 620 ft., and its greatest breadth 513. On the occasion of its dedication by Titus, 5000 wild beasts were slain in the arena, the games having lasted for nearly 100 days. The exterior is about 160 ft. in height, and consists of three rows of columns, Doric, Ionic, and Corinthian, and, above all, a row of Corinthian pilasters. Between the columns there are arches, which form open galleries throughout the whole building; and between each alternate pilaster of the upper tier there is a window. There were four tiers or stories of seats, corresponding to the four external stories. The first of these is supposed to have contained 24 rows of seats; and the second, 16. These were separated by a lofty wall from the third story, which is supposed to have contained the populace. The *podium* was a kind of covered gallery surrounding the arena, in which the emperor, the senators, and vestal virgins had their seats. The building was covered by a temporary awning or wooden roof, called *velarium*, the mode of adjusting and fastening which has given rise to many antiquarian conjectures. The open space in the center of the A. was called *arena*, the Latin word for sand, because it was covered with sand or sawdust during the performances. The taste for the excitement of the A. which existed in Rome naturally spread to the provinces, and large amphitheatres were erected not only in the provincial towns of Italy, as at Capua, Verona, Pompeii, etc., but at Arles and Nîmes, in France; and even in this country, at Cirencester, Silchester, and Dorchester.

**AMPHITRITÉ**, the daughter of the sea-god Nereus and of Doris—or, according to Apollodorus, of a daughter of Oceanus—was the wife of Neptune. When the latter demanded her in marriage, she fled to Mt. Atlas, but was discovered by a dolphin, which Neptune had sent after her, and borne back to him. As goddess and queen of the sea, she is represented with her husband's trident in her hand, sitting in a car of shells drawn by Tritons, or on a dolphin, before which a Cupid swims.

**AMPHITRYON**, legendary son of Alceus and Hipponome. He accidentally killed his uncle Electryon, for which he was expelled from Mycenæ and took refuge in Thebes. There he won the hand of Alcmena, and by her was father of Iphicles. He was killed in a war of Hercules against Erginus. His tomb was extant in Thebes in the days of Pausanias.

**AMPHIUMA**, a curious genus of *Batrachia*, having an eel-like form, a large head, thick and extensile lips, depressed and rounded snout; the neck contracted, with a transverse fold at the throat; numerous small teeth on the maxillary and palate bones, a single spiracle on each side of the neck; four legs, all very small and two-toed. A.

*means* is found in the southern and south-western parts of the United States. It attains a length of more than 2 ft. and is of a bluish-black color. It lives in muddy water or in mud, burrowing like a worm in the ditches of rice-fields, and feeds on small fish, molluscs, and insects. It is regarded by the negroes as highly venomous, but there is no reason for the notion.

**AMPHORA**, among the Greeks and Romans, was a large vessel, usually made of clay, shaped like our pitchers, with a narrow neck and two handles (hence the name, from Gr. *amphē*, on both sides, and *phero*, to carry), and often ending in a sharp point below, for being inserted in a stand or in the ground. Several of this sort, and in an upright position, were found in the cellars at Pompeii. The A. was chiefly used for the preservation of various liquids, especially wine, the age of which was marked on tickets affixed to the vessel. There is also evidence that amphoræ were employed as cinerary urns and as coffins. The A. among the ancients was likewise a measure for liquids. In Greece, it contained about 9 English gallons. The Roman A. was only two thirds of the Greek A. In modern times, *Anfora* is the name of a wine-measure in Venice.

**AMPLIFICATION**, i.e., enlargement, a term in Rhetoric, meaning that an idea, an opinion, or an inference is presented to the mind, accompanied by accessory circumstances. Its aim is to produce a powerful and vivid impression through the instrumentality of epithets, particulars, or other methods of elaboration. Rhetorical A. is generally produced—1st, by similitude; 2d, by contrast; 3d, by illustrating the universal in the particular; 4th, by piling up logical arguments. *Exaggeration* is an illegitimate kind of A., being the result of an undue enlargement of particular facts and circumstances.

**AMPLITUDE**, in astronomy, is the distance of a heavenly body, at the time of its rising or setting, from the e. or the w. point of the horizon. When the sun is in the equator (i. e., at the time of either equinox), he rises exactly e. and sets exactly w., and therefore has no A. His A. is at its maximum at midsummer, and again at midwinter; and that maximum depends upon the latitude of the place, being  $23\frac{1}{2}^{\circ}$  at the equator, and increasing to the arctic circle, where it becomes  $90^{\circ}$ . The A. of a fixed star remains constant all the year round.

**AMPULLA**, was a kind of bottle, used by the Romans for the preservation of liquids. It was made either of earthenware or glass, and sometimes, though very rarely, of more costly materials. Great numbers of such vessels have found their way into collections of antiquities. They are generally "belled," i.e., approaching to globular, narrowing towards the mouth, and provided with two handles. They are frequently mentioned in connection with the baths of ancient times. The *A. olivaria* was a "bottle of oil" which the Roman took with him when he went to the bath, and with which he anointed himself after his ablutions. Sometimes the oils were perfumed.

The *A. remensis* (the holy vessel, Fr. *la sainte ampoule*) was the name of that famous vessel in which was contained the unguent (believed to have been brought by a dove from heaven) that anointed Clovis, king of the Franks, at Rheims in 493 A.D., and with which every succeeding monarch of France, down to Louis XVI., was anointed at his coronation. The A. remensis was shattered, along with a great many more valuable things, at the revolution of 1789; but a fragment of it was preserved by some devout royalist, and handed over at the restoration to the archbishop of Rheims. Curious to say, a little of the miraculous substance still remained, which was mixed up with oil, and used to anoint Charles X. in 1825.

**AMPUTATION** (Lat. *amputo*, I lop or prune) is the cutting off of a part which, by its diseased condition, endangers, or may endanger, the safety of the whole body. The A. of a limb was in ancient times attended with great danger of the patient's dying during its performance, as surgeons had no efficient means of restraining the bleeding. They rarely ventured to remove a large portion of a limb, and when they did so, they cut in the gangrened parts, where they knew the vessels would not bleed; the smaller limbs they chopped off with a mallet and chisel; and in both cases had hot irons at hand with which to sear the raw surfaces, boiling oil in which to dip the stump, and various resins, mosses, and fungi, supposed to possess the power of arresting hemorrhage. Some tightly bandaged the limbs they wished to remove, so that they mortified and dropped off; and others amputated with red-hot knives, or knives made of wood or horn dipped in vitriol. The desired power of controlling the hemorrhage was obtained by the invention of the tourniquet (q.v.) in 1674 by a French surgeon, Morell. The ancient surgeons endeavored to save a covering of skin for the stump, by having the skin drawn upwards by an assistant, previously to using the knife. In 1679, Lowdham of Exeter suggested cutting semicircular flaps on one or both sides of a limb, so as to preserve a fleshy cushion to cover the end of the bone. Both these methods are now in use, and are known as the "circular" and the "flap" operations: the latter is most frequently used in this country.

A "flap" amputation is performed thus: The patient being placed in the most convenient position, an assistant compresses the main artery of the limb with his thumb, or a tourniquet is adjusted over it. Another assistant supports the limb. The surgeon with one hand lifts the tissues from the bone, and transfixing them with a long narrow knife, cuts rapidly downwards and towards the surface of the skin, forming a flap; he

then repeats this on the other side of the limb. An assistant now draws up these flaps, and the knife is carried round the bone, dividing any flesh still adhering to it. The surgeon now saws the bone. He then, with a small forceps, seizes the end of the main artery, and drawing it slightly from the tissues, an assistant ties it with a thread. All the vessels being secured, the flaps are stitched together with a needle and thread, and a piece of wet lint is laid over the wound. An expert surgeon can remove a limb thus in from 30 to 60 seconds.

**AMRÁOTÍ**, a district and city in India. The district has an area of 2563 sq.m., pop. '67, 407,276. It is a plain, about 800 ft. above tide, broken only by a line of hills 400 or 500 ft. higher. There are four considerable towns: the city of A., pop. 23,410; Karinja, 11,750; Badnera, on the great Indian peninsular railway which crosses the district, 6676; and Kolapur, 6169.

**AMRITSAR** (*Umrítsar*), a city of the Punjab, in n. lat. 31° 40', and e. long. 74° 45', containing (1868) 135,813 inhabitants. It is the religious metropolis, a distinction which, along with its name, it owes to its "pool of immortality," on an islet of which stands the chief temple of the Sikh faith. A. is a favorite haunt of pilgrims; and it was the place where, perhaps to bind the slippery Sikhs more firmly, was signed the treaty of 1846, for ceding to the British the territory between the Beas and the Sutlej. A. is, next to Delhi, the richest and most prosperous city in northern India, being connected with the capital, distant 36 m. to the w., by a canal, possessing considerable manufactures of cotton, silks, shawls, etc., and carrying on considerable trade. A. is on the Scinde, Punjab, and Delhi railway; and is the capital of a district of 2035 sq.m., with a pop. (1868) of 1,088,514, and of a division with an area of 5347 sq.m., and a pop. of 2,743,880, both of the same name.

**AMRU'-BEN-EL-ASS**, or **AMER**, d. 663 A.D., one of Mohammed's disciples, but before conversion a furious opponent. Like Saul, his change made his zeal greater on the other side, and chiefly to him were the prophet's successors indebted for the conquest of Syria. In 639 he led 4000 men into Egypt, besieged ancient Memphis, took it by storm, and on the spot built Fostat, the ruins of which are now known as old Cairo. In 640, after a siege of 14 months, he took Alexandria, losing 23,000 men. He is credited with projecting a canal to unite the Mediterranean and Red seas. He is charged with causing the destruction of the famous library at Alexandria, but the charge may well be dismissed, as it was not advanced until six centuries after his death. There is reason to believe that no large proportion of the 700,000 volumes left by the Ptolemies remained at the date of A.'s conquest.

**AMRU'-EL-KAIS**, or **AMROULCAYS**, an Arabian poet, contemporary with and opposed to Mohammed. Before the prophet announced his mission, A. wrote one of the seven poems called "Moallakat" (suspended) because they were suspended in the Kaaba at Mecca. They were put in English by Sir William Jones.

**AMSDORF**, **NIKOLAUS VON**, 1483-1565; a German Protestant reformer, an early and determined supporter of Luther; educated at Leipsic and first graduate of the new university at Wittenberg; professor of theology in 1511. He was with Luther at the Leipsic conference and the diet of Worms, and in the secret of his Wartburg seclusion. He assisted the first efforts at reformation in Magdeburg, Goslar, and Einbeck. He was active in the Schmalkald debates, and spoke strongly against the bigamy of the elector of Hesse. A. was made a bishop of Naumburg in 1542; resigned in 1547, and took part in founding the university of Jena. He superintended the publication of Luther's works, and opposed Melancthon on the separation of the High-Lutheran party.

**AMSLER**, **SAMUEL**, professor of the art of engraving on copper, in the academy of arts, Munich, was b. Dec. 17, 1791, at Schinznach, in Switzerland, received his first lessons from Lips of Zurich, and afterwards studied under Hess, in Munich. His first great work was an engraving from a Magdalen by Carlo Dolce. In 1816, he went to Rome, where, in several engravings of statues by Thorwaldsen, he succeeded well in uniting the characteristics of the originals with the simple style of Marcus Antonio. Aided by Barth and Hildburghausen, he engraved a title-page for the *Ley of the Nibelungen*, from a design by Cornelius. During his second sojourn in Rome (1820-1824), he began his great work, an engraving of "Alexander's Triumphal Procession," by Thorwaldsen. At Munich, in 1831, he finished his large plate of the "Burial of Christ," by Raphael, which, with his engraving of a statue of Christ, by Dannecker, displayed the highest qualities of imitative art. These works were followed by a "Holy Family," from Raphael, and the "Madonna di Casa Tempi." His last great work was an engraving from Overbeck's "Triumph of Religion in the Arts." A. d. May 18, 1849. His style is marked by a clear and noble treatment of form, rather than by strong contrast of tones. Few engravers have equaled A. in his deep knowledge and faithful representation of the works of Raphael.

**AMSTERDAM**, or **AMSTELDAM** (the dam or dike of the Amstel), the chief city of the Netherlands, is situated at the confluence of the Amstel with the IJ (pronounced Eye), an arm of the Zuiderzee, and is divided by the former, and numerous canals, into small islands, connected by about 300 bridges. Almost the whole city, which extends in the

the shape of a crescent, is founded on piles. At the beginning of the 13th c., it was merely a fishing-village, with a small castle, the residence of the lords of Amstel. In 1296, on account of the murder of count Floris of Holland, the rising town was demolished, and its inhabitants were compelled to leave it. Afterwards, with Amstelland (the district on the banks of the Amstel), it was taken under the protection of the counts of Holland, and under them enjoyed several privileges which contributed to its subsequent prosperity. In 1482, it was walled and fortified. It soon rose to be the first commercial place in the united states of the Netherlands; in 1585 was considerably enlarged by the building of the new town on the w.; and in 1623 had 100,000 inhabitants. This prosperity excited the envy of its neighbors. In the 17th c., the war with England so far reduced the commerce of A., that, in the year 1653, about 4000 houses were uninhabited. Prosperity was restored during the next century, and, though commerce was again injured by the disputes with England in 1781 and 1782, it once more revived. The union of Holland with France in 1810 entirely destroyed the foreign trade of A., while the excise and other new regulations impoverished its inland resources; but the old firms lived through the time of difficulty, and in 1815 commerce again began to expand.

The city has a fine appearance, when seen from the harbor, or from the high bridge over the Amstel. Numerous church towers and spires relieve the flatness of the prospect. The old ramparts have been levelled, planted with trees, and formed into promenades. Between 1866 and 1876, many spacious streets and an extensive public park were added to the city. Tramways have been successfully introduced, and the harbor greatly improved. There is railway communication with all parts of the country and of Europe. Rich grassy meadows surround the city. On the w. side are a great number of windmills for grinding corn and sawing wood. The three principal canals in A., on each side of which, with a carriage-way and row of trees intervening, the gentlemen's residences are built, run in semicircles within each other, and are from 2 to 3 m. long, called the Heerengracht, Keizer's-gracht, and Princengracht. The houses are built of brick, and have their gables towards the streets, which gives them a picturesque appearance. In old times, A. was strongly fortified; but now its only defense consists in the sluices, several miles distant from the city, which can flood, in a few hours, the surrounding land. A hard frost, however, like that of 1794-95, when Pichegru invaded the country, would render this means of defense useless.

The pop., 31st Dec., 1875, amounted to 289,981, the majority belonging to the Dutch reformed church. Of the remainder, the most numerous are the Roman Catholics, the Lutherans, Jews, and Baptists. The chief industrial establishments are sugar refineries, engineering works, mills for polishing diamonds and other precious stones, dockyards, manufactories of sails, ropes, tobacco, silks, gold and silver plate and jewelry, colors and chemical preparations, breweries, distilleries, with export houses for corn and colonial produce; cotton-spinning, book-printing, and type-founding are also carried on. Income of the city (1875), £496,929; expenditure, £450,127; debt, £3,518,526. The ships which cleared in were 1020; out, 1040. The former Stadhuis, converted into a palace for king Louis Bonaparte, and still retained by the reigning family, is a noble structure raised upon 13.659 piles, and extending 290 ft. in length, by 239 ft. in breadth, surmounted by a round tower, rising 190 ft. from the base. It has a hall, 120 ft. long, 57 ft. wide, and 90 ft. high, lined with white Italian marble—an apartment of great splendor.

The *Nieuwe Kerk* (New Church), founded in 1408, is the finest ecclesiastical structure in the city. Its chancel is especially admired. It contains the tombs of admiral de Ruyter, of the famous Dutch poet Vondel, and of various other notable persons. The Old Church (*Oude Kerk*), built in the 14th c., contains several monuments of naval heroes. Literature, science, and recreation are not forgotten in the pressure of business, for A. has its academy of arts and sciences, an excellent museum of paintings by the old masters and other collections, a library, harmonic societies, a botanical and a zoological garden, and several theaters. The hospital for aged people, the poor-house, house of correction, the orphan asylums, a navigation school, and many benevolent societies, are well supported, and managed on good principles. Large ships reach the city by the North Holland canal (52 m. in length) from Nieuwe Diep, but, if drawing more than 15½ ft. of water, must first discharge a large part of the cargo. To avoid this delay and expense, the IJ has been separated from the Zuider Zee by a sea-dike, with sluices for admitting the small inland ships, and pumping-machinery capable of discharging 2500 cubic meters of water per minute. Two piers have been built into the North sea, near Wijk aan Zee, to form a harbor. The peninsula has been cut by a canal which is continued through the IJ, and capable of admitting vessels drawing 22 ft. direct to A., reducing also the distance from 52 to 15 m., the length of the new canal. In carrying out these works, about 12,000 acres of excellent land have been reclaimed from the IJ, and in 1876 a large tract was already bearing fine crops.

**AMSTERDAM**, a barren islet in lat. 37° 52' s., and long. 77° 37' e., the home of sea-birds, shell-fish, and seals. It is worthy, however, of notice at once for its structure and its situation. Manifestly of volcanic origin, it still possesses a burning soil and hot springs; and along with its single neighbor, St. Paul, 60 m. to the n.e., it is about midway in the direct line between the cape of Good Hope and Van Diemen's Land, being also at nearly the same distance from cape Comorin.

AMSTERDAM, a t. in Montgomery co., N. Y., 23 m. n.w. of Albany, on the Mohawk river and the N. Y. Central Railroad. There are six churches, a score of factories, banks, and two weekly newspapers. Pop. '75, 9045.

AMU, AMU DARIA, or JEHUN. See OXUS, *ante*.

AMUCK', or AMOOK, RUNNING (Javanese, *amook*, "to kill"), a custom in Java among those in whom a ferocious madness is produced by long use of opium. The sufferer rushes abroad armed with some weapon, usually a creese, or large dirk, striking indiscriminately at all whom he encounters. When one is seen to start on his madness, the people cry "amook," and immediately hunt the maniac to death. Probably in many cases this is deliberate on the victim's part, as a means of suicide. This madness is known only by the Javanese.

AMULET, any object worn as a charm. It is often a stone or piece of metal, with an inscription or some figures engraved on it, and is generally suspended from the neck, and worn as a preservative against sickness, witchcraft, etc. Its origin, like its name, seems to be oriental. The ancient Egyptians had their amulets, sometimes forming necklaces. Among the Greeks, such a protective charm was styled *phylacterion*; among the Romans, *amuletum*. This word is probably derived from the Arabic *hamulet* ("what is suspended"). The phylacteries of the Jews (see Matt. xxiii. 5), slips of parchment on which passages of the law were written, were evidently worn as badges of piety by the Pharisees; but were also regarded as wholesome preservatives from evil spirits, and from all manner of harm. From the heathen, the use of amulets passed into the Christian church, the inscription on them being *ichthus* (the Greek word for a fish), because it contained the initials of the Greek words for Jesus Christ, Son of God, Saviour. See ABBREVIATIONS. Among the Gnostic sects, Abraxas stones (q.v.) were much used. Amulets soon became so common among Christians that, in the 4th c., the clergy were interdicted from making and selling them on pain of deprivation of holy orders; and in 721 the wearing of amulets was solemnly condemned by the church. Among the Turks and many other nations of central Asia, every person considers it necessary to wear a preservative charm. With the spread of Arabian astronomy, the astrological A. or talisman (q.v.) of the Arabs found its way to Europe. Kopp, a German author, has written a work, *Talismanographia Critica*, on amulets and their inscriptions. Among amulets in repute in the middle ages were the coins attributed to St. Helena, the mother of Constantine. These and other coins marked with a cross were thought specially efficacious against epilepsy, and are generally found perforated, for the purpose of being worn suspended from the neck.—The belief in the virtue of amulets is not extinct among the vulgar.

AMURATH', or MURAD', I., 1326-89; Sultan of the Ottoman Turks, succeeding his father Orkhan in 1360. He was the first to lead Turkish arms into Europe, and in 1361 took Adrianople, fixed there his residence, built a splendid mosque, and further adorned the city. Urban V. preached a crusade against him, but the venture was disastrous to the Christians. The Greek emperor John Palaeologus was his ally; but the son of the Greek and one of A.'s sons made a conspiracy, which was defeated and young Amurath was put to death by his father. A. was a good soldier but illiterate, signing treaties by dipping his hand in ink and making a mark with three fingers together, with the fourth finger and thumb at distant places. He lost his life in the battle of Cassova, and was succeeded by his son Bajazet.

AMURATH', or MURAD', II., 1404-51; tenth emperor of the Turks, succeeding Mohammed I. in 1421. He took Salonika (Thessalonika) from the Venetians and opened the way for subjugating Greece. He went on successfully till 1442, when he was defeated by Hunnaides and obliged to make peace with the Christians. At that time he lost a son, and abdicated in favor of another son, Mohammed, only 14 years of age. The Christians renewed the war, and hastening from retirement he defeated them in the important battle of Varna, Nov. 10, 1444, where Ladislas, king of Hungary, fell. He again retired, and again came forth to quell an insurrection of the janissaries. He invaded Albania and the Peloponnesus, where George Castriot (Scanderbeg) defeated him; but he retreated only to gain a great victory over his former adversary Hunnaides, at Cassova, Oct. 17, 1448, in a battle lasting three days. He was the first Ottoman emperor who caused bridges of great length to be built; and in his reign poetry, jurisprudence, and theology began to flourish. He died of apoplexy at Adrianople.

AMURATH', or MURAD', III., 1545-95; succeeded his father, Selim II., in 1573 as sultan of the Turks. It is said that his first words to his courtiers at accession were, "I am hungry; give me something to eat," and they were prophetic of the famines and disasters of his reign. In 1579, queen Elizabeth gained his friendship, and made with him a commercial treaty. In his reign the janissaries began to know their power, and to hasten the ruin of the state by revolts. He was superstitious, feeble, irritable, fond of dancing, music, and the pleasures of the harem.

AMURATH', or MURAD', IV., 1611-40; succeeded his uncle Mustapha in 1622. The chief event of his reign was the recovery of Bagdad after 30 days' incessant assault upon the Persian defenders. His bloody character has given him the name of the Turkish

Nero. On repossessing Bagaad he slew 30,000 Persians in cold blood. It is supposed that this ferocity and his early death at the age of 39 were due to perpetual intoxication.

AMUSSAT, JEAN ZULÉMA, 1796-1856; a French surgeon. He entered the army, was assistant surgeon under Esquirol in La Salpêtrière hospital, and prosecutor at the Paris faculty of medicine. He improved and invented many surgical instruments, and was the first to show the importance of torsion of arteries in hemorrhage. He wrote on the nervous system, lithotomy, etc.

AMURNATH, a cave amidst the mountains which bound Cashmere on the n.e. It is a natural cave in a rock of gypsum, about 100 yards wide, 20 high, and 500 deep. It is believed by the Hindus to be the residence of the god Siva, and is therefore visited by multitudes of pilgrims. It is inhabited by vast numbers of doves, which fly out in alarm on the loud shouting of prayers by the pilgrims, and this is supposed to indicate the acceptance of their prayers.

AMYCLÆ, an old Laconian t., was situated on the eastern bank of the Eurotas, 20 stadia s.e. of Sparta, in a richly wooded and fertile region. It was a famous city in the heroic age, the abode of Tyndarus and his spouse Leda, who bore to Jupiter the twins, Castor and Pollux (called *Amyclæi fratres*, the Amyclæan brothers), and also Helena. Long after the Dorians had subjugated and peopled the rest of the Peloponnesus, A. continued to be a free Achaean town. It was conquered by the Spartans only before the first Messenian war, and in consequence of a curious and absurd law. The inhabitants were so often agitated by false rumors of the approach of the Spartans, that, growing tired of living in a state of continual alarm, they decreed that no one should henceforth mention or even take notice of these disagreeable fictions. Unfortunately, the Spartans *did* come at length, and according to the Greek saying, "A. perished through silence." Hence the proverb, *Amyclæi ipsis taciturnior* (more silent than A. itself). After its conquest, A. became a village, noted only for its annual festival of the Hyacinthia, and its temple of Apollo, with the colossal statue of the god himself.—A., an ancient city on the coast of Campania, Italy, said to have been built by a colony from the Greek A. It had ceased to exist in the time of Pliny.

AMYGDALÆE, or DRUPACEÆ, according to some botanists, a natural order of dicotyledonous plants, but more generally regarded as a sub-order of ROSACEÆ. The species are all trees or shrubs. They have the tube of the calyx lined with a disk, the pistil a solitary simple carpel with a terminal style, the fruit a drupe. For other botanical characters, see ROSACEÆ. The bark yields gum, and hydrocyanic acid is present in very notable quantity in different parts, as the leaves, kernels, etc. The A. are chiefly natives of the cold and temperate regions of the northern hemisphere. Some of them yield valuable fruits; and various products of the order are used in medicine. See ALMOND, PEACH, NECTARINE, PLUM, CHERRY, and CHERRY LAUREL. This order or sub-order contains about 110 known species.

AMYGDALIN ( $C_{10}H_{17}NO_{22}, 6HO$ ) is a crystalline principle existing in the kernel of bitter almonds, the leaves of the *cerasus lauro-cerasus*, and various other plants, which, by distillation, yield hydrocyanic acid. It is obtained, by extraction with boiling alcohol, from the paste or cake of bitter almonds, which remains after the fixed oil has been separated by pressure. The alcoholic solution usually contains more or less oil, which must be removed by decantation or filtration; it must then be evaporated till a syrup is left, which must be diluted with water, mixed with yeast, and set aside to ferment, in order to get rid of any sugar that may be present: on now filtering and evaporating, the amygdalin crystallizes in thin transparent needle-like prisms. It has a sweetish somewhat bitter taste, and is not poisonous, and when treated with alkaline solvents, ammonia is expelled, and amygdalic acid,  $HO, C_{10}H_{26}O_{21}$ , is produced. Its most remarkable change is, however, that which is noticed in the article ALMONDS, VOLATILE OIL, or, and which may be thus briefly stated. When the bruised almond kernel, or almond paste, is brought in contact with water, the peculiar odor of bitter almonds is almost immediately evolved; and in twenty-four hours all traces of amygdalin will have disappeared, its place being taken by essential oil of almonds, hydrocyanic acid, sugar, and formic acid. This transformation is due to the presence of a peculiar nitrogenous matter called emulsin (q.v.), or synaptase, which sets up a kind of fermentation. As the proportion of hydrocyanic acid which is liberated by the above reaction is fixed, Liebig and Wöhler recommend that amygdalin should be employed in preparing that acid for medicinal purposes. Amygdalin may be dissolved in water for any length of time without undergoing change; but if it be mixed with an emulsion of sweet almonds, immediate decomposition ensues. Seventeen grains of amygdalin, when dissolved in 1 oz. of emulsion of sweet almonds, furnish exactly 1 grain of pure hydrocyanic acid, which may be readily diluted to the strength of the pharmacopœial acid.

AMYGDALOID (from *amygdalus*, an almond), a rock, consisting of a basis of some kind of trap-rock, very frequently of greenstone, forming numerous roundish or oval cells, which are filled with nodules, often of calcareous spar or of zeolitic minerals. The cells are not of large size, but even those which are almost adjacent differ much in this respect. The nodules are evidently the result of a sublimation and imperfect crystallization, under the action of the heat which formed the cells. Empty cells often

occur amongst those which are filled with minerals. The name A. is sometimes extended to rocks of the same character, although the basis be not of trap.

**AMYL** ( $C_{10}H_{21}$ ) is the fifth in the series of alcohol radicals whose general formula is  $C_nH_{2n+1}$ , and of which methyl and ethyl are the first two members. It is obtained by heating amyl-iodide with an amalgam of zinc in a closed tube at a temperature of about  $350^\circ$ , and is one of the natural products of the distillation of coal. It is a colorless liquid, with a sp. gr. of  $32^\circ$ , a boiling-point of  $311^\circ$ , and a somewhat aromatic odor, and it exerts a right-handed rotatory action on a ray of polarized light. It enters into a large number of chemical compounds, most of which—as, for instance, bromide, chloride, iodide, etc.—are derived from amylie alcohol, which bears precisely the same relation to amyl that ordinary alcohol bears to ethyl ( $C_2H_5$ ). Amylic alcohol is sufficiently described in the article FUSEL OIL, which is the name given to the crude alcohol. It seems invariably to accompany ordinary alcohol when the latter is prepared by fermentation, and apparently occurs in largest quantity in those liquids which remain most alkaline during fermentation.

**AMYLA CEUS** (from *amylum*, starch), a term used in chemistry and botany, and equivalent to starchy.—*A. food* is food consisting at least in great part of some kind of starch, as arrow-root, sago, etc.—A compound radical, called *amyle*, is formed by the decomposition of starch in a peculiar fermentation—the *amylie fermentation*—but to it the term A. has no reference.

**AMYLENE**, a thin colorless liquid, boiling at  $102^\circ$  F., density of vapor 2.43; sp. gr. 0.65; discovered in 1844 by Balard. It is produced by treating amylie alcohol with sulphuric or phosphoric acid. It is very volatile, mixes with alcohol and ether, and burns with a white flame; combines actively with bromine, the hydriacids, and chloride of sulphur. Its vapor is rapidly absorbed by sulphuric anhydride and perchloride of antimony. It has been used like chloroform as an anæsthetic, but with occasional fatal results.

**AMYLIC ALCOHOL.** See FUSEL OIL.

**AMYOT**, or **AMIOT**, JACQUES, a French writer, well known by his excellent translations of the Greek classics, was b. in 1513, and d. in 1593. Racine highly esteemed the translations by A., of which the version of Plutarch is one of the best, and has passed through several editions.—**AMIOT**, Joseph, a celebrated Jesuit and oriental scholar, was b. at Toulon in 1718, and lived as a missionary in China from 1750 to the time of his death, in 1794. His knowledge of the Chinese and Tatar languages enabled him to collect many valuable notices of antiquities, history, language, and arts, in China. Many of his writings may be found in the *Mémoires concernant l'Histoire, les Sciences et les Arts des Chinois* (15 vols. Paris, 1776-1791). His *Dictionnaire Tatar-Mantchou Français* was edited by Langlès in 1789.

**AMYRAUT**, MOÏSE, 1596-1664; an eminent French Protestant theologian and metaphysician, of an illustrious family from Alsace. His father set him to study law, and he made rapid progress in the university of Poitiers; but on his way home met at Saumur the Protestant minister, Bonchereau, who took him to Plessis-Mornay, governor of the city, and the two persuaded A. to leave law for theology. He dwelt at Saumur, and "sat at the feet of the great Cameron," a pupil as great as his master. His fame became such that universities and churches in Saumur, Paris, and Rome competed for his presence. A. referred all to the synod of Anjou, and its decision settled him at Saumur, both as professor and pastor. His co-professors were Louis Capell and Josua de la Place; and their life-long friendship was beautiful and remarkable, as is their memory as joint authors of the *Theses Saumurienis*. In 1631, A. published *Traité des Religions*, still a living work; and thenceforward he was foremost in provincial and national synods. His character was largely shown when the Charrenton synod of 1631 chose him to present to the king the *Copy of the Complaints and Grievances for the Infractions and Violations of the Edict of Nantes*. Before this time all save Roman Catholic deputies had addressed the king on their knees; but A. refused to speak unless he could stand as did the Romanists. A warm debate ensued, and even Richelieu consented to visit privately the stout Protestant, and reason with him; but he insisted and carried the day, and in presence of the sovereign, his rehearsal, given with suavity and dignity, charmed even his adversaries. His oration was at once published in the *Mercury*, and is a historic landmark in French Protestantism. He took part in all the great controversies on predestination, Arminianism, etc., of the time; holding fast to Calvinism, but with a liberality not usual in that severe sect. The university at Saumur became the fountain-head of French Protestantism, and A. had as many as 100 students in attendance upon his prelections. He left many works which are still the religious consolation of humble French homes. In 1657, he was hurt by a fall which perhaps hastened his death.

**AMYRIDA CEE**, a natural order of dicotyledonous or exogenous plants, consisting of trees and shrubs, natives of tropical countries, remarkable for the abundance of their fragrant balsamic or resinous juice. They have compound leaves, occasionally with stipules and pellucid dots. The flowers are in racemes or panicles; the calyx persistent, with 2 to 5 divisions; the petals are 3 to 5; aestivation valvate or imbricated. The stamens are twice or four times as many as the petals. The ovary is superior, sessile, 1 to 5 celled,

inserted in a large disk; the style solitary and compound, or wanting; the stigmas as many as the cells of the ovary; the ovules in pairs, anatropal. The fruit is hard and dry, 1 to 5 celled, its outer rind often splitting into valves. The seeds are exalbuminous. About 40 or 50 species are referred to the order; but many of them are still very imperfectly known. Some species afford valuable timber; but the principal products of the order are fragrant resins and balsams, as Myrrh (q.v.), and different kinds of frankincense (q.v.), olibanum (q.v.), elemi (q.v.), bdellium (q.v.), tacamahac (q.v.), balsam of gilead (q.v.), etc. Among the more important genera of the order may be named *amyris*, *balsamodendron*, *boswellia*, and *icica*. *Canarium commune*, a native of Java, which yields a gum similar in its properties to the balsam of copaiva (q.v.), produces also triangular nuts, which are eaten both raw and dressed, and from which an oil is extracted for the table and for burning. *Balanites egyptiaca* is cultivated in Egypt for its fruit, a drupe, which is eaten, and from the seeds of which a fat oil is expressed, called *zachu*.

**ANA**, a termination added to the names of remarkable men, to designate collections of their sayings, anecdotes, etc.; as in the works entitled *Baconiana*, *Johannsoniana*. Such titles were first used in France, where they became common after the publication of *Scaligerana* by the brothers Dupuy (Hague, 1666). In English literature there are many works of this kind. America, also, has its *Washingtoniana*. A tolerably complete catalogue of works with such titles may be found in Namur's *Bibliographie des Ouvrages publiés sous le Nom d'Ana* (Brussels, 1839).

**ANABAPTISTS**, a term applied generally to those Christians who reject infant baptism, and administer the rite only to adults; so that when a new member joins them, he or she is baptized a second time, the first being considered no baptism. The name (Gr. to baptize again) is thus owing to an accidental circumstance, and is disclaimed by the more recent opponents of infant baptism, both on the continent and in Great Britain.

The origin of the sect cannot be distinctly traced; but it is manifestly connected with the controversy about infant baptism carried on in the early church. Opposition to this doctrine was kept alive in the various so-called heretical sects that went by the general name of Cathari (i.e., purists), such as the Waldenses, Albigenses, etc. Shortly after the beginning of the reformation, the opposition to infant baptism appeared anew, especially among a set of fanatical enthusiasts called the prophets of Zwickau, in Saxony, at whose head were Thomas Münzer (q.v.) (1520) and others. Münzer went to Waldshut, on the borders of Switzerland, which soon became a chief seat of anabaptism, and a center whence visionaries and fanatics spread over Switzerland. They pretended to new revelations, dreamed of the establishment of the kingdom of heaven on earth, and summoned princes to join them, on pain of losing their temporal power. They rejected infant baptism, and taught that those who joined them must be baptized anew with the baptism of the Spirit; they also proclaimed the community of goods, and the equality of all Christians. These doctrines naturally fell in with and supported the "peasant war" (q.v.) that had about that time (1525) broken out from real causes of oppression. The sect spread rapidly through Westphalia, Holstein, and the Netherlands, in spite of the severest persecutions. The battle of Frankenhausen (see MÜNZER) crushed their progress in Saxony and Franconia. Still, scattered adherents of the doctrines continued, and were again brought together in various places by traveling preachers. In this capacity, one Melchior Hoffmann, a furrier of Swabia, distinguished himself, who appeared as a visionary preacher in Kiel in 1527, and in Emden in 1538. In the last town he installed a baker, John Matthiesen, of Haarlem, as bishop, and then went to Strasburg, where he died in prison. Matthiesen began to send out apostles of the new doctrine. Two of these went to Münster, where they found fanatical coadjutors in the Protestant minister Rothmann, and the burghers Knipperdolling and Krechting, and were shortly joined by the tailor Bockhold, of Leyden, and Gerrit Kippenbrock, of Amsterdam, a bookbinder, and at last by Matthiesen himself. With their adherents, they soon made themselves masters of the city; Matthiesen set up as a prophet, and when he lost his life in a sally against the bishop of Münster, who was besieging the town, Bockhold and Knipperdolling took his place. The churches were now destroyed, and 12 judges were appointed over the tribes, as among the Israelites; and Bockhold (1534) had himself crowned king of the "New Sion," under the name of John of Leyden. The Anabaptist madness in Münster now went beyond all bounds. The city became the scene of the wildest licentiousness; until several Protestant princes, uniting with the bishop, took the city, and by executing the leaders, put an end to the new kingdom (1535).

But the principles disseminated by the A. were not so easily crushed. As early as 1533 the adherents of the sect had been driven from Emden, and taken refuge in the Netherlands; and in Amsterdam the doctrine took root and spread. Bockhold also had sent out apostles, some of whom had given up the wild fanaticism of their master; they let alone the community of goods and women, and taught the other doctrines of the A., and the establishment of a new kingdom of pure Christians. They grounded their doctrines chiefly on the Apocalypse. One of the most distinguished of this class was David Joris, a glass-painter of Delft (1501-1556). Joris united liberalism with anabaptism, devoted himself to mystic theology, and sought to effect a union of parties. He

acquired many adherents, who studied his book of miracles (*Wunderbuch*), which appeared at Deventer in 1542, and looked upon him as a sort of new Messiah. Being persecuted, he withdrew from his party, lived inoffensively at Basle, under the name of John of Bruges, and died there in the communion of the reformed church. It was only in 1559 that his heretical doctrines came to light, when the council of Basle had the bones of Joris dug up, and burned under the gallows.

The rude and fanatical period of the history of anabaptism closes with the scandal of Münster. A new era begins with Menno Simons. (See MENNO.) Surrounded by dangers, Menno succeeded, by prudent zeal, in collecting the scattered adherents of the sect, and in founding congregations in the Netherlands, and in various parts of Germany. He called the members of the community "God's congregation, poor, unarmed Christians, brothers;" later, they took the name of Mennonites, and at present they call themselves, in Germany, Taufgesante; in Holland, Doopsgezinden—corresponding very nearly to the English designation Baptists. This, besides being a more appropriate designation, avoids offensive association with the early Anabaptists. Menno expounded his principles in his *Fundamentbuche von dem rechten Christlichen Glauben*, 1556 (Elements of the True Christian Faith). This book is still an authority among the body, who lay particular stress on receiving the doctrines of the scripture with simple faith, and acting strictly up to them, and set no value on learning and the scientific elaboration of doctrines. They reject the taking of oaths, war, every kind of revenge, divorce (except for adultery), infant baptism, and the undertaking of the office of magistrate; magistracy they hold to be an institution necessary for the present, but foreign to the kingdom of Christ; the church is the community of the saints, which must be kept pure by strict discipline. With regard to grace, they profess universalism, or hold it to be designed for all, and their views of the Lord's supper fall in with those of Zwingli; in its celebration, the rite of feet-washing is retained. In Germany, Switzerland, and Alsace, their form of worship differs little from the Lutheran. Their bishops, elders, and teachers serve gratis. Children receive their name at birth, baptism is performed in the place of worship, and adults that join the sect are rebaptized.

But along with these general principles there have been endless diversities and splits in the sect, occasioned by differences as to strictness of discipline. This cause divided the body, as early as 1554, into the mild and the strict Mennonites. The first are known by the title of Waterlinders, from a place in Holland; the second split again into a multitude of subdivisions, according to minute shades of strictness, and their several designations, derived from the names of leaders, places, and even peculiarities of dress (John-Jacob Christians, Buttoners, Hook-and-eye-ers, etc.), bewilder the student of ecclesiastical history. The purity of their lives, however, commanded everywhere respect, and their industry made them prosperous; so that they gradually secured formal toleration in many places.

Almost the only split among the early continental Baptists on doctrinal grounds was that which took place in Amsterdam in 1664. Arminianism had not been without its influence, especially among the Waterlinders, originally more liberal in their views. A leading congregation accordingly divided into two parties, one (Galenists, from Galenus, their leader) advocating freer views in doctrine and discipline; the other (Apostolists, from Samuel Apostool) adhering to absolute predestination and the discipline of Menno. The liberal party rejected creeds as of human invention, adopted much of the philosophy and theology of England, and exercised no little influence on the intellectual progress of Holland. These two parties gradually absorbed the other sections of the Baptists in the Netherlands; and about the beginning of the 19th c., a union took place by which all the congregations now belong to one body.

In Germany, the Baptists have made some attempts in more recent times to extend their church with considerable success. Under the Baptist Union of Germany (which, although including churches in Holland, Poland, and other countries, derives its strength largely from Prussia) there were, in 1872, 163 churches, with 19,393 members. In Prussia, various concessions had been made to the Baptists early in this century, such as exemption from military service. They were tolerated in Bavaria, Baden, Württemberg, Mecklenburg, Russia, France, and Denmark; but were expelled from Sweden. Wherever they are settled, they are respected as quiet, industrious subjects; but several German governments have imposed restrictions on their exercise of public worship; the reason assigned being the tendency to visionary enthusiasm, which had again shown itself in some congregations.

As the representatives of the sect in Great Britain and North America have little or no historical connection with the earlier A. of the continent, they fall more properly to be noticed under BAPTISTS.

**ANABASIDÆ, or LABYRINTHERANCHIDÆ**, a family of acanthopterygious fishes, characterized by a remarkable structure of the upper membranes of the pharynx, which are divided into small irregular leaves, containing between them cellular reservoirs. These retain water sufficient to keep the gills moist for a considerable time, and so enable the fish to subsist out of water, and to travel some distance on dry ground; some of the species, as the climbing perch (q.v.) of India (*anabas scandens*), climbing steep banks, or even trees, by means of the spines of the fins, tail, and gill-covers. *Ophicephalus margi-*

*natus* is often seen traveling among the grass in the beginning of the rainy season. The fishes of this family appear to leave the water for various reasons; but very commonly, it would appear, upon account of the drying up of pools in periodical drougths, their peculiar organization enabling them to go in search of others. They are all fresh-water fishes, natives of the s.e. of Asia, continent and islands, and of South Africa. The species are numerous, and are arranged under 11 genera. Some of them are much esteemed for their delicacy as food.

**ANABASIS** (Greek), literally, an ascent or a march out of a lower into a higher country—the name of two historical works: 1. The *A. of Cyrus*, written by Xenophon, which gives a narrative of the unfortunate expedition of the younger Cyrus against his brother, the Persian king Artaxerxes, and of the retreat of his 10,000 Greek allies under the command of Xenophon; 2. The *A. of Alexander*, written by Arrian, and giving an account of the campaigns of Alexander the great.

**ANABLEPS** (from the Gr. *anableps*, to look up), a genus of fishes of the order *mala-copterygii abdominales*, family *cyprinide* of Cuvier—of the family *cyprinodontide* (q.v.) of Agassiz—characterized by a structure of the eyes to which there is nothing similar in any other vertebrated animals. This consists in a division of the *cornea* and *iris* into two somewhat unequal elliptical parts, by transverse bands formed of the *conjunctiva* (see EYE), so that the animal appears to have four eyes, and there are really two pupils on each side, the other parts of the eye being single. This peculiarity of structure is supposed to be connected with a habit which these fishes are said to have of swimming with the eyes partly out of the water. They are elongated, scaly fishes, with flattish rounded back, and depressed head. The young are brought forth alive, and in a state of considerable advancement. The best known species, *A. tetraphthalmus*, inhabits the rivers of Guiana and Surinam.

**ANACARDIACEÆ** (TEREBINTACEÆ of some botanists, and part of TEREINTACEÆ of others), a natural order of dicotyledonous or exogenous plants, consisting of trees and shrubs, which abound in a resinous, sometimes acrid and poisonous juice. The leaves are alternate and without dots; the flowers inconspicuous, usually unisexual. The calyx is generally small and persistent, and has generally five divisions; the petals are perigynous, equal in number to the segments of the calyx, imbricated in æstivation, occasionally wanting. The stamens are equal in number to the petals, and alternate with them, or twice as many, or more; distinct when there is a fleshy disk, cohering at the base when the disk is wanting. The ovary is usually single, free or adhering to the calyx, 1-celled; the styles 1, 3, or 4, occasionally wanting; the ovule solitary, attached to the bottom of the cell by a cord. The fruit is usually a drupe, the seed exalbuminous. The order contains about 95 known species, chiefly but not exclusively tropical, amongst which are a considerable number valuable for the resinous juices and varnishes which they yield, as the varnish of Sylhet, varnish of Martaban, Japan lacker, etc., and others, which produce wholesome and pleasant fruits. See CASHEW NUT, PISTACIA, MASTIC, TURPENTINE TREE, MANGO, HOG PLUM.

**ANACARDIUM.** See CASHEW NUT.

**ANACHARIS**, a genus of plants of the natural order *hydrocharideæ* (q.v.), of which a species, *A. alismastrum* (*elodea canadensis* of some botanists), has recently become naturalized in Britain, suddenly appearing in so great abundance as to impede the navigation of some rivers and canals. It is a native of North America, growing in ponds and slow streams and is a dark-green, much-branched perennial, entirely floating under water, its flowers only appearing above water for a very short time at the period of fertilization, as in others of the order to which it belongs. It has numerous leaves, which are either opposite, or in whorls of 3 or 4, without foot-stalks, linear-oblong, transparent, 3 to 4 lines long. The female flowers are sessile in the upper axils, and are inclosed in a small 2-lobed spathe; the slender tube of the perianth is often 2 or 3 in. long, so as to attain the surface of the water, where it terminates in three or six small spreading segments. The male flowers are seldom observed. The plant was first found in Britain in 1842, by the late Dr. Johnston of Berwick, in the lake of Dunse castle; and again in 1847 by Miss Kirby, in the reservoirs of a canal in Leicestershire. It is now very abundant and troublesome in the Trent, Derwent, and other rivers. Its rapidity of growth is extraordinary. Immense masses disfigure the shallows of the Trent, and cover the beds of the deeps. It strikes its shoots under the mud in a lateral direction for 6 in. or 1 ft., and then rises and spreads. The stems are very brittle, and every fragment is capable of growing, so that the means usually adopted to get quit of it serve rather for its propagation. It appears, however, that water-fowl are very fond of it; and by them, probably, its seeds may be conveyed from one river to another. It has been found that swans may be fed upon it with advantage, and its excessive growth kept down more effectually in this way than in any other. It is supposed to be a great impediment to the progress of salmon ascending the rivers in which it occurs; but for some kinds of fish it probably affords both food and shelter. The manner of its introduction into Britain is unknown, although it has been conjectured that it may have escaped from some garden-pond—a conjecture the more doubtful, from the distance between the localities in which it was first found; but its rapid increase is of great scientific interest, in connec-

tion with the important subject of the distribution of species. As being calculated to block up water-courses, the plant involves some serious economic considerations.

**ANACHARSIS**, a Scythian and brother of king Saulios, visited Athens in the time of Solon, with whom he lived on terms of intimacy, but whose abilities for framing a constitution he does not seem to have estimated highly. Incited by a love of learning, he subsequently traveled through several countries. On account of his clearness of understanding, he was numbered among the seven wise men; and many sagacious proverbs and sayings were ascribed to him. No other "barbarian" ever received the Athenian franchise. The letters which bear his name were written long after his time. It is said that, after his return to his native land, he was put to death by order of the king, who feared the introduction of the mysteries belonging to the Greek religion, in which it was supposed that A. had been initiated.

Under the title, *Voyage du Jeune Anacharsis en Grèce* (Travels of the young Anacharsis in Greece), Jean Jacques Barthélemy, a well-known French author (q.v.), wrote a description of Greek life and manners, displaying learning and good taste, but disfigured by many anachronisms. A. is made to visit Athens only a few years before the birth of Alexander the great, and the features of several distinct periods in Grecian history are confusedly regarded as having been contemporaneous. The book, therefore, will not bear a critical examination; but it has contributed its share towards an improved knowledge of ancient life, and has given rise to several similar works, such as the *Galins* and *Charicles* of Becker. The A. of Barthélemy has been translated into English, and is to be found in most old libraries; it is still a deservedly esteemed work, which may be read with advantage by the young.

**ANACHRONISM**, an error in chronology. Sometimes an A. is purposely made for the sake of effect, or to bring certain events within convenient compass for dramatic purposes. Shakespeare, in his *Julius Cæsar*, makes the "clock" strike three; and Schiller, in his *Piccolomini*, speaks of a "lightning-conductor" as existing about 150 years before the date of its invention. These discrepancies, however, do not seriously injure the general truth of a poetical work. The A. is more offensive when, in a work which pedantically adheres to the costumes and other external features of old times, we find a modern style of thought and language, as in the old French dramas of Corneille and Racine. In popular epic poetry A. is a common feature. Achilles is always young; Helena, always beautiful. In their versions of old classic traditions, the writers of the middle ages converted Alexander, Æneas, and other ancient heroes, into good Christian knights of the 12th century. In the *Nibelungen-lied*, Attila and Theodoric are good friends and allies, though the latter began to reign some 40 years after the former. At the end of the poem the heroine, who must have been nearly 60 years old, and had passed through great affliction and sorrow, is still the "beautiful queen Kriemhild."—Many ludicrous examples of A. may be found in old paintings, e.g., Abraham, Isaac, and Jacob in modern costumes.

**ANACLA'CHE**, one of the mountains of Bolivia, in 18° 12' s., 69° 20' w.; about 4 m. high, always covered with snow.

**ANACLE'TUS I.**, SAINT; second or third bishop of Rome, a martyr under Domitian. Others say that he succeeded Clement I. as fifth Roman bishop, and was martyred about 109 A.D.

**ANACLE'TUS II.**, PETER DE LEON, anti-pope. He was chosen in 1129 by a faction of cardinals opposed to Innocent II., and was sustained by the Roman and some other states. He maintained himself at Rome against the arms of Lothaire, the opposition of other kings, and the clergy in general; d. 1138.

**ANACONDA**, *Eunectes murina*, a serpent of the boa family, native of tropical America. It passes most of its time in shallow lakes or streams, living chiefly on small rodents, iguanas, fish, and occasionally monkeys and ant-eaters, which it crushes and swallows. It is not venomous, and is handled without danger. The natives, who make shoes and bags of its skin, use its fat for oil, and its flesh for food. It is ovoviviparous; swims rapidly and can remain long under water. It is seldom more than 20 ft. long.

**ANACREON**, one of the most esteemed lyric poets of Greece, was b. at Teos, a seaport of Ionia, spent part of his youth in Abdera, to which place most of his fellow-townsmen emigrated when the city was taken by the Persians in 540 B.C., and rose to fame as a poet about 530 B.C. He was patronized by Polycrates, the ruler of Samos, who invited him to his court; and there he sang, in light and flowing strains, the praise of wine and beauty. After the death of Polycrates, he went to Athens (521 B.C.), and was received with distinguished honor by Hipparchus. On the fall of Hipparchus, he left Athens, and probably returned to Teos, from which, during the insurrection of Ionia against Darius, he fled to Abdera, where he d., at the age of 85. According to tradition, he was choked by a dried grape. Great honors were paid to him after his death; Teos put his likeness upon its coins, and a statue was raised to him on the Acropolis of Athens, which represented him in a state of vinous hilarity.

Only a few of his poems have been preserved. Of five books which once existed, only 68 lyrics now exist which bear his name; but of these, comparatively few are to be confidently regarded as genuine. They exhibit great simplicity and delicacy of expres-

sion, fertility of invention, and variety of illustration. Moore, a poet of congenial spirit, translated the *Odes* of A. into English verse.

**ANACYCLUS.** See PELLITORY OF SPAIN.

**ANADYOMENE** ("emerging"), one of the names of Venus; a painting by Apelles, representing Venus rising from the sea, and wringing her flowing wet hair. Phryne or Paucaste was supposed to have supplied the model for this master-piece of Apelles. The inhabitants of the island of Cos bought the picture, and placed it in the temple of Æsculapius. Augustus afterwards bought it for 100 talents of remitted taxes, and placed it in the temple of Venus Genetrix. It is frequently described in the Greek anthology.

**ANADYR'**, or **ANADIR**, a sea or large gulf of n.e. Asia, much resorted to by whalers. — **ANADYR RIVER**, in e. Siberia, flows 500 m. through rocky, barren, and snowy regions, and empties in the sea of A.

**ANÆMIA** (from *a*, privative, and *aima*, blood) is the condition generally termed poverty of blood, and consists essentially of a diminution in the fibrine, and especially in the proportion of red corpuscles of the blood (see BLOOD), which in some cases of A. may be so low as 27 in 1000 parts. Persons in an anæmic condition have pale waxy complexions, pallid lips and tongues, and if blood be drawn from them, it forms a clot which is less red, and also smaller in proportion to the serum, than blood from a healthy person.

They suffer from palpitations, fainting, and headaches, singing in the ears, and disturbed vision: and the symptoms may simulate organic disease within the head or of the heart. This A. condition may be induced by repeated losses of blood, or by defective nutrition, or by some cause, as in chlorosis, when the balance is disturbed between the loss and reproduction of the red corpuscles.

The curative treatment of A. consists in allowing the patient fresh air, good nourishment, and those materials which promote the formation of the deficient elements of the vital fluid. Of these, the principal is iron, of which there are several preparations. This remedy has, in some instances of chlorosis, doubled the proportion of red blood corpuscles in a very short time.

**ANÆSTHESIA** (*a*, privative, and *aisthēsis*, sensation) is a term used to express a loss of sensibility to external impressions, which may involve a part or the whole surface of the body. In some diseased conditions of the nervous centers, a part of the body may become totally insensible to pain, while, in another part, sensation may be unnaturally acute, or be in a state of hyperæsthesia. When a nerve is divided, there is no feeling of touch or pain referred to the parts which it supplies, because these are cut off from communication with the brain; and in some diseases, as the *elephantiasis græcorum*, a loss of sensation in patches of the skin is an early and characteristic symptom. This insensibility to external impressions may be either *peripheral*—that is, on the surface of the body—or *central*, that is, from a cause acting primarily upon the brain or spinal cord.

In ancient writers, we read of insensibility or indifference to pain being obtained by means of Indian hemp (*canabis Indica*), either inhaled or taken into the stomach. The Chinese, more than 1500 years ago, used a preparation of hemp, or *ma-yo*, to annul pain. The Greeks and Romans used mandragora for a similar purpose (*pocin anæsthēsian*); and as late as the 13th c., the vapor from a sponge filled with mandragora, opium, and other sedatives was used. The mandragora, however, occasionally induced convulsions, with other alarming symptoms; and though Bulleyn, an English author (1579), mentions the possibility of putting patients who were to be cut for the stone into "a trance or a deepe terrible dreame" by its use, it gradually became obsolete and banished from the pharmacopœia. John Baptista Porta, of Naples, in his work on natural magic (1597), speaks of a quintessence extracted from medicines by somniferous *menstrua*. This was kept in leaden vessels, perfectly closed, lest the *aura* should escape, for the medicine would vanish away. "When it is used, the cover being removed, it is applied to the nostrils of the sleeper, who draws in the most subtle power of the vapor by smelling, and so blocks up the fortress of the senses, that he is plunged into the most profound sleep, and cannot be roused without the greatest effort. . . . These things are plain to the skillful physician, but unintelligible to the wicked." In 1784, Dr. Moore, of London, used compression on the nerves of a limb requiring amputation, but this method was in itself productive of much pain. In 1800, Sir Humphry Davy, experimenting with the nitrous oxide or laughing-gas, suggested its usefulness as an anæsthetic; and in 1828, Dr. Hickman suggested carbonic acid gas. As early as 1795, Dr. Pearson had used the vapor of sulphuric ether for the relief of spasmodic affections of the respiration. The fact that sulphuric ether could produce insensibility was shown by the American physicians Godwin (1822), Mitchell (1832), Jackson (1833), Wood and Bache (1834); but it was first used to prevent the pain of an operation in 1846, by Dr. Morton, a dentist of Boston. The news of his success reached England on 17th Dec., 1846; on the 19th, Mr. Robinson, a dentist, and Mr. Liston, the eminent surgeon, operated on patients rendered insensible by the inhalation of sulphuric ether. This material was extensively used for a year, when Sir J. Y. Simpson, of Edinburgh, discovered the anæsthetic powers of

*chloroform* (see CHLOROFORM), and introduced the use of it into his own department, midwifery. Since that time, chloroform has been the anæsthetic in general use in Europe, but either is preferred in America. It is now the opinion of most medical men, that chloroform should not be given where there is weak action of the heart from disease. Other substances have been used by inhalation, such as nitric ether and bichloride of methylene. The latter substance has been recommended by Dr. Richardson, of London; but it has not been generally accepted, as it depresses to a dangerous extent after it has been administered for some time.

Nothing could be more desirable than the power of producing *local A.* Freezing mixtures have been employed; a stream of carbonic acid or cooled air, or a finely divided spray of ether, have been thrown on the part. All of these methods have the disadvantage that they injure the tissues, and may be followed by much pain. An agent which would benumb the sensory nerves, without injuring them or the neighboring parts, is still a great want. Recently, in dentistry, the inhalation of nitrous oxide has been much employed. It is rapid in action, and is not usually followed by unpleasant effects; but as it induces a condition in the blood similar to that in asphyxia, its use is not unattended with danger. Chloroform continues to occupy its high place as one of the greatest blessings granted to man. It is proper, however, to say that it requires to be used under certain precautions, and that in unskillful hands its application may be fatal.

See *On Chloroform and other Anæsthetics*, by John Snow (Lond., 1858); *The Obstetric Memoirs and Contributions of James Y. Simpson* (Edin., 1855).

#### ANAGALLIS. See PIMPERNEL.

**ANAGNI** (anc. *Anagnin*), a t. of central Italy, 37 m. e.s.e. from Rome. It stands on a hill in the midst of a fertile district, and, although an ill-built t., is the residence of many noble families. It is the seat of a bishop. There are some remains of ancient buildings. The ancient *Anagnia* was the chief city of the Hernici. It was a place of importance during the whole period of Roman history, and Virgil mentions it as the "wealthy Anagnia." Pop. 6000.

**ANAGRAM** (from the Greek *ana*, backwards, and *gramma*, writing), the transposition of the letters of a word, phrase, or short sentence, so as to form a new word or sentence. It originally signified a simple reversal of the order of letters, but has long borne the sense in which it is now used. The Cabalists attached great importance to anagrams, believing in some relation of them to the character or destiny of the persons from whose names they were formed. Plato entertained a similar notion, and the later Platonists rivaled the Cabalists in ascribing to them mysterious virtues. Although now classed among follies, or at best among ingenious trifles, anagrams formerly employed the most serious minds, and some of the puritanical writers commended the use of them. Cotton Mather, in his elegy on the death of John Wilson, the first pastor of Boston, in New England, mentions

His care to guide his flock and feed his lambs  
By words, works, prayers, psalms, alms, and anagrams.

The best anagrams are such as have, in the new order of letters, some signification appropriate to that from which they are formed. It was a great triumph of the mediæval anagrammatist to find in Pilate's question, "*Quid est veritas?*" (What is truth?) its own answer: "*Est vir qui adest*" (It is the man who is here). Anagrams, in the days of their popularity, were much employed, both for complimentary and for satirical purposes; and a little straining was often employed in the omission, addition, or alteration of letters, although, of course, the merit of an A. depended much upon its accuracy.

I. D'Israeli (*Curiosities of Literature*, vol. iii.) has a chapter on anagrams, which, as an exercise of ingenuity, he ranks far above acrostics. Among a great many considered by him worthy of record, are the following: The mistress of Charles IX. of France was named *Marie Touchet*; this became *le charme tout* (I charm every one), "which is historically just." The flatterers of James I. of England proved his right to the British monarchy, as the descendant of the mythical king Arthur, from his name *Charles James Stuart*, which becomes *claims Arthur's seat*. An author, in dedicating a book to the same monarch, finds that in *James Stuart* he has a *just master*. "But, perhaps, the happiest of anagrams was produced on a singular person and occasion. Lady Eleanor Davies, the wife of the celebrated Sir John Davies, the poet, was a very extraordinary character. She was the Cassandra of her age, and several of her predictions warranted her to conceive she was a prophetess. As her prophecies in the troubled times of Charles I. were usually against the government, she was at length brought by them into the court of high commission. The prophetess was not a little mad, and fancied the spirit of Daniel was in her, from an A. she had formed of her name,

ELEANOR DAVIES.  
*Reveal, O Daniel!*

The A. had too much by an *l*, and too little by an *s*; yet *Daniel* and *reveal* were in it, and that was sufficient to satisfy her inspirations. The court attempted to dispossess the spirit from the lady, while the bishops were in vain reasoning the point with her out of the scriptures, to no purpose, she poisoning text against text: one of the deans of the

arches, says Heylin, shot her through and through with an arrow borrowed from her own quiver; he took a pen, and at last hit upon this excellent A.:

DAME ELEANOR DAVIES,  
*Never so mad a Ladie!*

The happy fancy put the solemn court into laughter, and Cassandra into the utmost dejection of spirit. Foiled by her own weapons, her spirit suddenly forsook her; and either she never afterwards ventured on prophesying, or the A. perpetually reminded her hearers of her state—and we hear no more of this prophetess."

On a visit to King's Newton hall, in Derbyshire, Charles II. is said to have left written on one of the windows, *Cras ero lux* (To-morrow I shall be light), which is the A. of *Carolus Rex*.

AN'AHEIM, a t. in Los Angeles co., California, 12 m. from the ocean; the center of a great wine interest. In 1875, the California wine product was 8,000,000 gallons.

ANAHUAC, a Mexican term, said to signify "near the water." Its application is vague in the extreme. It is either a plateau or a ridge. As a ridge, again it oscillates between the continuation of the Rocky mountains, below lat. 40° n., and that branch of the chain which runs nearly parallel to the upper course of the Rio Bravo del Norte; and as a plateau, it designates either the whole of the table-land of Mexico or certain portions thereof, more or less extensive, with the capital as a common center. Practically, if one acceptance is more generally admitted than another, A. may be regarded as the largest of those plateaus—a definition which, with reference to the number of lakes, seems more peculiarly to suit the etymology of the word. See further, CORDILLERAS OF CENTRAL AMERICA—a description which, for want of a briefer and better one, may be made to embrace all that less regular section of the backbone of America which lies between the simple formations of the Andes to the s. and the Rocky mountains to the n.

AN'AKIM, a gigantic race of people, whose stronghold was Kirjath-arba, in the s. of Palestine. In the opinion of some biblical critics, they were not Canaanites, as they are not included in the list of devoted nations; others, again, conclude from the fact that invariably mention is made only of three individuals or families, that the name is appellative rather than gentile, and that the A. were merely particular tribes of the wide-spread and powerful Amorites, distinguished for their unusual stature. Be that as it may, the Israelites considered them too dangerous for neighbors, and consequently subjected them to the same stern treatment as the rest. It was the A. whose appearance so terrified the Hebrew spies who entered the land of promise from Kadesh-barnea. Those who escaped the sword of Joshua fled to the country of the Philistines; and it has been conjectured that Goliath and the other Philistine giants were their descendants; a supposition probable enough, when we reflect that the particular places in which the fugitive A. took refuge were Gaza, Gath, and Ashdod. The word Anak means a necklace or neck-chain; and some have supposed that these giants received that name from the circumstance of their wearing such ornaments proudly round their necks; others translate the word A. by "long-necked men," or men with long-stretched necks, i.e., men of great height. The A., however, in all probability, immediately derived their name from Anak, the son of Arba.

ANAKOLUTHON is a term employed both in grammar and rhetoric, to denote the absence of strict logical sequence in the grammatical construction. Good writers sometimes sacrifice this logical sequence to emphasis, clearness, or graceful arrangement. In colloquial speech, nothing is more common than examples of A.

ANAL'CIME, CUBICITE, or SARCOLITE, a silicate of alumina and soda, usually occurring in 24-sided crystals, and sometimes in cubes with the eight solid angles replaced by the faces of an octahedron. It is found in the lake Superior copper region.

ANALEMMA, a name given to a projection of a sphere upon a plane. In this form of projection, called also *orthographic*, the plane of projection is that of a meridian, or one parallel thereto, and the point of sight is assumed at an infinite distance on a line normal to the plane of projection and passing through the center of the sphere. A circle which is parallel to the plane of projection is projected into an equal circle; a circle perpendicular to the plane of projection is projected into a right line equal in length to the diameter of the projected circle; a circle in any other position is projected into an ellipse, whose major axis equals the diameter of the projected circle. The term A. was also applied to an instrument of brass or wood, on which such a projection was accompanied by a horizon; it was used in finding the time of the rising or setting of the sun.

ANAL GLANDS. Under this name may be described a large and diversified group of glands, found in many animals, and generally characterized by the disagreeable odor of their secretion. Those to which the name most strictly belongs are of frequent occurrence among carnivora and rodents; they consist of follicles which pour their secretion into sacs with muscular walls and narrow orifices, placed one on each side of the anus. According to the most recent investigations, it appears that these sacs are to be considered as prolongations inwards of the common integument, and that two sorts of glands open into them; one of a lobulated structure, having a fatty secretion, and representing

the sebaceous glands of the skin greatly hypertrophied; the other crowded more at the bottom of the sac, tubular, and elaborating the specific secretion. In the hyena, there is a single sac, which opens by a transverse fissure above the vent. There is a gradual passage from true A. G. to others of a somewhat different character. Thus, there are glands called inguinal in the hare and rabbit—little bare places pouring out an unctuous secretion, which are held to be equivalent to A. G., only not inclosed in sacs. The civet cat has an anal sac on each side of the vent; and also two other sacs opening by a common outlet in front of the vent; and from the latter is derived the substance known as civet, which the negroes seek for on the trees where it has been left by the civet cats. The civet gland furnishes a natural link between the A. G. and those more closely connected with the genital apertures, called preputial. The most remarkable are those of the beaver, large sacs found both in the male and female, and which furnish the castoreum of commerce. The beaver has true A. G. besides. The sac which contains the musk of the musk-deer lies in the middle line beneath the skin of the abdomen, and opens at the prepuce. The secretion peculiar to badgers, polecats, and skunks, and which they use as an instrument of defense, shielding themselves from their adversaries by an overpowering and intolerable odor, comes from a pouch situated beneath the tail. In some animals, we meet with secretions similar to some of the above, poured out on other parts of the body. Thus, in the bat, there are glands on the face opening above the mouth, which prepare a fetid oily secretion; the so-called lacrymal follicles of ruminants, and the cutaneous glands of the tail of the deer, secrete a dark unctuous humor; and the temporal gland between the eye and the ear of the elephant pours out an oily substance at rutting-time. The peccary has an odoriferous gland on its back; and the crocodile has a musk-sack under the lower jaw. Anal sacs opening immediately behind the vent are also found in the crocodile and in many serpents.

**ANALOGUE**, a term in comparative anatomy. Organs are *analogous* to one another, or are *analogues*, when they perform the same function, though they may be altogether different in structure; as the wings of a bird and the wings of an insect. Organs, again, are *homologous*, or *homologues*, when they are constructed on the same plan, undergo a similar development, and bear the same relative position, and this independent of either form or function. Thus, the arms of a man and the wings of a bird are homologues of one another. See **HOMOLOGY**.

**ANALOGY**, a term originally Greek, and which signifies an agreement or correspondence in certain respects between things in other respects different. Euclid employed it to signify proportion, or the equality of ratios, and it has retained this sense in mathematics; but it is a term little used in the exact sciences, and of very frequent use in every other department of knowledge and of human affairs. In grammar we speak of the A. of language, i.e., the correspondence of a word or phrase with the genius of the language, as learned from the manner in which its words and phrases are ordinarily formed. A., in fact, supposes a rule inferred from observation of instances, and upon the application of which, in other instances not precisely, but in some respects, similar, we venture, with more or less confidence, according to the degree of ascertained similarity, and according to the extent of observation from which our knowledge of the rule has been derived. The opposite to A. is *anomaly* (Gr. irregularity); and this term is used not only in grammar, but with reference to objects of natural history which in any respect are exceptions to the ordinary rule of their class or kind. In the progress of science, analogies have been discovered pervading all nature, and upon which conclusions are often based with great confidence and safety. Reasoning from A. indeed warrants only probable conclusions; but the probability may become of a very high degree, and in the affairs of life we must often act upon conclusions thus attained. Reasoning from A., however, requires much caution in the reasoner. Yet even when its conclusions are very uncertain, they often serve to guide inquiry and lead to discovery. Many of the most brilliant discoveries recently made in natural science were the result of investigations thus directed. Where the proper evidence of truth is of another kind, arguments from A. are often of great use for the removal of objections. It is thus that they are employed by bishop Butler in his *A. of Religion, Natural and Revealed, to the Constitution and Course of Nature*. In law, reasoning from A. must often, to a certain extent, be admitted in the application of statutes to particular cases. Upon similar reasoning, the practice of medicine very much depends. To discover the meaning of any composition, it is also often necessary; the sense of the author in a passage somewhat obscure being in some measure determined according to passages in which he has expressed himself more clearly. The application of this rule to the interpretation of Scripture is a point of difference between Protestants and Roman Catholics, the latter insisting upon the interpretation of difficult passages by ecclesiastical tradition and authority. The extension of it to the whole Scriptures, however, depends upon the admission of their inspiration; but this, when fully admitted, warrants a more confident use of analogical reasoning than in the case of the works, or even of a single work, of an uninspired author. Protestant theologians have very generally employed, with reference to this rule of interpretation, the phrase "A. of faith," deriving it from Rom. xii. 6; but the meaning of the expression in that verse is disputed. However, the reality of an A. of faith, and the right of reasoning from it, are not affected by any criticism on that verse.

**ANALYSIS** (Gr.), the resolution of a whole into its component parts. In mental philosophy, this term is applied to the logical treatment of an idea so as to resolve it into other ideas which combine to form it. A judgment or proposition may thus also be analyzed. The opposite of A. is *synthesis* (q.v.); and the opposition of these terms is common in other branches of science as well as in mental philosophy. We speak of an *analytic* method in science, and of a *synthetic method*; and both are necessary, the one coming to the assistance of the other to secure against error, and promote the ascertainment of truth. The analytic method proceeds from the examination of facts to the determination of principles; whilst the synthetic method proceeds to the determination of consequences from principles known or assumed. The test of perfection in a theory is the harmony of the results obtained by the methods of A. and synthesis.

*Mathematical A.*, in the modern sense of the term, is the method of treating all quantities as unknown numbers, and representing them for this purpose by symbols, such as letters, the relations subsisting among them being thus stated and subjected to further investigation. It is therefore the same thing with algebra, in the widest sense of that term, although the term algebra is more strictly limited to what relates to equations, and thus denotes only the first part of A. The second part of it, or A. more strictly so called, is divided into the A. of finite quantities, and the A. of infinite quantities. To the former, also called the theory of functions, belong the subjects of series, logarithms, curves, etc. The A. of infinities comprehends the differential calculus, the integral calculus, and the calculus of variations. To the diligent prosecution of mathematical A. by minds of the greatest acuteness, is to be ascribed the great progress both of pure and applied mathematics within the last two centuries.

The A. of the ancient mathematicians was a thing entirely different from this, and consisted simply in the application of the analytic method as opposed to the synthetic, to the solution of geometrical questions. That which was to be proved being in the first place assumed, an inquiry was instituted into those things upon which it depended, and thus the investigation proceeded, as it were, back, until something was reached which was already ascertained, and from which the new proposition might be seen by necessary consequence to flow. A reversal of the steps of the inquiry now gave the synthetical proof of the proposition. The modern mathematical A. affords a much more easy and rapid means of solving geometrical questions; but the ancient A. also afforded opportunity for the exercise of much acuteness, and was the chief instrument of the advancement of mathematical science until comparatively recent times. The invention of it is ascribed to Plato; but of the works of the ancients on geometrical A. none are extant, except some portions of those of Euclid, Apollonius of Perga, and Archimedes.

**ANALYSIS**, in chemistry, is the term applied to that department of experimental science which has for its object the chemical disunion or separation of the constituents of a compound substance: thus, the resolution of water into its components, hydrogen and oxygen; of common salt into chlorine and sodium; of marble into lime and carbonic acid; of rust into iron and oxygen; of sugar into carbon, hydrogen, and oxygen; and of chloroform into carbon, hydrogen, and chlorine—are all examples of chemical A. This department of chemistry, therefore, takes cognizance of the breaking down of the more complex or compound substances into their more simple and elementary constituents, and is antagonistic to *chemical synthesis*, which treats of the union of the more simple or elementary bodies to produce the more complex or compound. Chemical A. is of two kinds: *Qualitative A.*, which determines the quality or nature of the ingredients of a compound, without regard to the quantity of each which may be present; and *quantitative A.*, which calls in the aid of the balance or measure, and estimates the exact proportion, by weight or volume, in which the several constituents are united. Thus, *qualitative A.* informs us what water, marble, common salt, etc., are composed of; but it remains for *quantitative A.* to tell us that water consists of 1 part of hydrogen by weight united with 8 parts of oxygen; that marble is composed of 28 parts of lime and 22 of carbonic acid; common salt, of 35½ parts of chlorine and 23 of sodium; turpentine, of 30 carbon and 4 hydrogen; chloroform, of 12 carbon, 1 hydrogen, and 106½ chlorine.

The divisions of inorganic (mineral) chemistry and organic (vegetable and animal) chemistry have led to a corresponding classification of chemical A. into *inorganic A.*, comprehending the processes followed and the results obtained in the investigation of the atmosphere, water, soils, and rocks; and *organic A.*, treating of the modes of isolation and the nature of the ingredients found in or derived from organized structures—viz., plants and animals. Both departments afford examples of what are called *proximate* and *ultimate A.* Proximate A. is the resolution of a compound substance into components which are themselves compound: thus, in inorganic chemistry, marble is resolved into lime (calcium united with oxygen) and carbonic acid (carbon with oxygen); whilst ultimate A. comprehends the disunion of a compound into its *elements* or the simplest forms of matter: thus, lime into calcium and oxygen; carbonic acid into carbon and oxygen; water into hydrogen and oxygen. Organic chemistry affords still better examples of each class: thus, ordinary wheat-flour, when subjected to proximate A., yields, as its proximate components, gluten (vegetable fibrin), albumen, starch, sugar, gum, oil, and saline matter; but each of these proximate ingredients is in itself compound, and when they undergo ultimate A., the gluten and albumen yield, as their ultimate elements or

constituents, carbon, hydrogen, oxygen, nitrogen, sulphur, and phosphorus; and the starch, sugar, gum, and oil are found built up of carbon, hydrogen, and oxygen.

Several other terms are in use in chemical treatises: thus *Gas A.* is applied to the processes employed in the examination of the various gases, and is every day becoming of more and more importance and interest. *Metallurgic A.* includes the smelting of metallic ores, the assays of alloys of gold, silver, etc., and, in general, everything that pertains to the ultimate A. of metallic ores and compounds. *Agricultural A.* is restricted to the examination of manures, feeding-stuffs, and soils; *medical or physiological A.* to the investigation of blood, urine, and other animal fluids and juices, and the examination of medicinal compounds; whilst *commercial A.* is the term used where great accuracy or nicety of detail is not required in an A., but where the commercially important constituents alone are determined, as the separation and recording of the amount of phosphates; ammonia, and alkaline salts in a sample of guano; the total amount of saline matter in a certain water; the iron in an iron-stone, the lime in a limestone, etc.

ANALYTICAL CHEMISTRY is that department of chemistry which takes cognizance of analyses. The analytical chemist requires some peculiar apparatus, together with re-agents, generally solutions, by the addition or reaction of which the nature and amount of the ingredients of a compound are determined.

ANAM' or ANNAM, is an independent kingdom in the east of Further India, and is often called Cochin-China (q.v.). It consists of the once separate states of Tonquin and Cochin-China, and of a part of the ancient kingdom of Cambodia. At present it comprises Tonquin in the n., the whole of Cochin-China, with the exception of the six provinces ceded to France in 1867, and Tsiampa in the s. The country is mountainous in the interior, has rich plains in the n. and s., and along its coast-land has excellent harbors. Tonquin possesses rich stores of gold, silver, copper, and iron; and in A. are found most of the best-known products of southern Asia. The area is estimated at near 200,000 sq.m., and the pop. at 21,000,000. The government is an absolute monarchy, and is sometimes called an empire. The independence of A. (as against China) was guaranteed by France in 1872, the king agreeing to accommodate his policy to that of France, to annul all laws against Christians and converts, and to open three ports to foreign vessels. Hitherto the trade of A. has been almost wholly with China, and even in A. is chiefly in the hands of Chinese residents. The Anamese, who speak a monosyllabic tongue, are intelligent and peaceful, and are clever ship-builders. For the most part they worship tutelary deities; but the upper classes are Confucians, and Buddhism is tolerated. There are besides 420,000 Roman Catholic Christians in A. See COCHIN-CHINA and SAIGON.

ANAM', or ANNAM' (*ante*). The treaty with France concluded at Saigon, March, 1874, secured to the emperor of A. independence of all foreign powers, especially of the emperors of China. For this protection the emperor of A. pledged himself to accommodate his policy to that of France, to annul the enactments affecting the Roman Catholic religion, to open several ports to foreign commerce, and to admit to those ports French consuls and a limited number of armed guards. This treaty opened the ports of Haiphong and Hanoi in 1875; and of Quinhon in 1876. Haiphong is a mere village on one of the mouths of the Songkoi, or Hongkiang (red river), at a point reached by vessels drawing about 14 ft. of water. Hanoi, also on the Hongkiang, is properly the capital of Tonquin. Quinhon is a seaport in 13° 50' n. and 69° e. The form of government in A. is an unlimited monarchy. Hwang-te, the emperor, has a personal council and seven ministers. The principal divisions of the empire, Tonquin and Cochin-China, have each a viceroy, and there is a governor at the head of each province. The empire of A. comprises Cochin-China (independent of the six provinces of lower Cochin-China, which were ceded to France in 1862-67) and the province of Tonquin (conquered in 1862) in the n.; and Tsiampa in the s.; also, as tributaries, the territory of the Laos, and the independent Moi tribes. The area of A. is about 200,000 sq.m., and its pop. is supposed to be 12,000,000, of whom the largest portion are in the provinces of Tonquin. Hué is the capital, with a population, including the suburbs, of 50,000, of whom about 3,000 are Chinese. The religion of the great mass of the people is a belief in witchcraft, while the educated classes adhere to the doctrines of Confucius, and Buddhism is tolerated. The Christians (Roman Catholics) are rated at 420,000. The army is in six corps, comprising 150,000 men; each corps comprises five regiments of 12 companies, or 25,000 men. The navy consists of seven small corvettes, 300 junks, and a few vessels ceded by France in 1876; the whole armament being 1400 guns and 16,000 men. The imports are hardware, cotton thread, hosiery, Chinese faience, mirrors, opium, paper, petroleum, tea, dyes, and liquors. There are no railroads or telegraphs in the empire. The country produces sugar, rice, tropical fruits, and valuable timber. The people partake of the characteristics of their neighbors, the Chinese on one side and the Malays on the other. They are indolent, inoffensive, and fond of gayety. In dress and social customs, they are much like the Chinese, though their women are not compelled to live in seclusion. See COCHIN-CHINA, *ante*.

ANAMBOE', or ANAMABOE', a seaport on the African gold coast, 10 m. e. of Cape Coast Castle; pop. about 5000. It is the seat of some trade, and was once a great slave

port. The British fort here is the strongest on the coast. Exports, gold-dust, ivory, palm-oil, and pea-nuts.

**ANAMIE' TA.** See *COCCULUS INDICUS*.

**ANAMORPHOSIS**, an ideal change of development or form that may be found in the members of a group of plants or animals. It has been suggested that by the process of A. animals and plants of the present time have been developed. In optics A. is a drawing, which when viewed directly appears distorted or confused, but whose image in a curved mirror, viewed from a proper point, is an intelligible and consistent picture.

**ANA'NAS.** See *PINE-APPLE*.

**ANANIAS**, one of the members of the young church at Jerusalem who conspired with his wife, Sapphira, to make a false pretense respecting their gift of property to the community of the brethren, and was, with his wife, struck dead. Another A. is mentioned in Acts ix. 12, and elsewhere. Still another A. was a high-priest at Jerusalem (Acts xxiii. 2).

**ANAPA'**, a sea-port in Russia, on the Black sea; pop. 9000. The town is fortified. Its harbor is not safe in all weather.

**AN'ARCHY** (from the Gr. *a*, privative, and *arche*, government), the state of society without any regular government, when a country is torn by the strife of parties, and no law or authority remains. Complete A. is necessarily rare and of short duration; but conditions approaching to it often arise after revolutions and gross abuses in government; and in such cases it is apt to become, as in the South American states, a chronic or permanent evil, attended with constant national decay.

**ANARRHICHAS.** See *WOLF-FISH*.

**ANAS**, a Linnæan genus of birds, included in the order *palmipedes* (web-footed birds) of the system of Cuvier, and divided by recent ornithologists into a number of genera; one of which, retaining the name A., contains the true ducks, and others contain the swans (*cygnus*), geese (*anser*), scoters (*oidemia*), garrets (*clangula*), eiders (*somateria*), pochards (*fuligula*), shovelers (*rhyncaspis*), shieldrakes (*tadorna*), musk-ducks (*cairina*), teal (*querquedula*), widgeons (*mareca*), etc. These, with mergansers (*mergus*) and flamingoes (*phœnicopterus*), constitute the family *anatide* of some ornithologists. Cuvier places them in a family called by him *lamellirostres*, and distinguished by a thick bill, horny only at the nail-like extremity, and elsewhere invested with a soft skin, the edges furnished with laminae, or with small teeth particularly adapted for the purpose of separating the food from the mud which is often taken into the bill along with it. The laminae, and large and broad bill, are the chief characteristics of the old genus A. Some, as the true ducks, subsist in great part on small insects; others, as geese and swans, almost exclusively on vegetable food. The species are very numerous, distributed over all parts of the world, some of them very abundant in the polar regions. Some are important for their feathers or down, others for their flesh and for their eggs. A few have been domesticated, and are commonly kept for economic uses. See *DUCK*, *GOOSE*, *SWAN*, *ELDER*, *BARNACLE*, *TEAL*, etc.

**ANASTASIUS I.**, emperor of the east, was b. in 430 A.D., at Dyrrachium, in Epirus, of an obscure family. The early portion of his life is unknown to history. On the death of Zeno, he was proclaimed emperor by the senate, and crowned on the 11th April, 491, at the age of 60. He owed his elevation to Ariadne, widow of Zeno, whom he married. No monarch was ever more notable for his heresies. One of his generals, Vitalian, taking advantage of this unpopular feature of his character, revolted, ravaged Thrace, Scythia, and Moesia, compelled A. to promise to recall the orthodox bishops whom he had banished, and secured for himself the title of governor of Thrace. A., however, had some good natural qualities, and performed certain praiseworthy actions. He suppressed the cruel and degrading spectacles where men fought with wild beasts, abolished the sale of offices, the tax on domestic animals, which had existed since the days of Vespasian, built a wall on the w. side of Constantinople to defend it from the incursions of the barbarians, constructed aqueducts in the city of Hierapolis, made a harbor at Cæsarea, and restored the "pharos" or light-house at Alexandria. He died 8th July, 518.—**ANASTASIUS II.**, emperor of the east, was born about the middle of the 7th c., and died in 719 A.D. His great aim was to restore peace to the church, but his measures led to his deposition.

**ANASTASIUS II.**, emperor, elected to the throne of Constantinople by the senate and people in 713. He organized a formidable naval force which mutinied at Rhodes and proclaimed Theodosius, a low person, emperor; and this Theodosius took Constantinople six months later, when A. escaped to Thessalonica and became a monk. In 721, he led a revolt against Leo, the successor of Theodosius, but fell into Leo's hands and was put to death.

**ANASTASIUS I.**, patriarch of Constantinople, was b. in the second half of the 7th century. He favored the party of iconoclasts, or image-breakers. He owed his elevation to the emperor Leon, who exacted from him a pledge that he would assist in the destruction of the images. A. kept his word; but having made himself obnoxious to the new

emperor, Constantine Copronymus, the latter (743) seized him, put out his eyes, and marched him through the hippodrome (race-course) mounted on an ass with his head to the tail. He d. in 753.

**ANASTASIUS I.** was elected pope, or rather bishop of Rome, 398 A.D. He succeeded Siricius, one year after the death of Ambrose. Under his pontificate, flourished Chrysostom, Augustine, and Jerome. The most conspicuous act of his life was the reconciliation of the church at Antioch with that of Rome, after a schism of 17 years. Among the epistles attributed to A., two are obviously apocryphal; the one addressed to Nereianus; the other to the German bishops. The latter commanded the faithful to remain standing while the gospel was read in the churches, that neophytes should receive holy orders only on the recommendation of five bishops, and that the Manichæans, who had been expelled from Rome, should not be admitted into Germany. But the first of these epistles is posterior to the death of A., and the second anterior to his accession to the pontificate. A. was vehemently opposed to the doctrines of Origen, one of whose works (*Peri Archōns*, i.e., *Concerning Principles*) he condemned as heretical. For this he is praised by Jerome, who calls him a man of a holy life, of a "rich poverty," and of an apostolical earnestness. During his life, several councils were held, at Carthage, Constantinople, Ephesus, and Toledo. He d. Dec. 14, 401 A.D.—There were three other popes of this name: ANASTASIUS II. (496–498), ANASTASIUS III. (911–913), and ANASTASIUS IV. (1153–54). See POPE.

**ANASTASIUS**, SAINT, surnamed ASTRIC, apostle of the Hungarians, was b. in 954, and d. in 1044. A Frenchman by birth, he finally settled, after various changes, at the court of Stephen, duke of Hungary, where he became very influential, and was intrusted with the ecclesiastical organization of the land. All his energies were devoted to securing the triumph of the Christian faith.

**ANASTATIC PRINTING.** See PRINTING.

**ANASTATICA.** See ROSE OF JERICHO.

Arteries  
anastomosing.

**ANASTOMOSIS** (Gr., the making of a mouth or opening), an anatomical term used to express the union of the vessels which carry blood or other fluids, and also, for convenience' sake, the junction of nerves. The veins and absorbents anastomose to form large single trunks, as they approach their ultimate destinations. The arteries break up into small branches, for the supply of the tissues, and each small vessel again communicates with others given off above and below. At each large joint there is a very free A., so that the safety of the limb beyond may not be entirely dependent on the single arterial trunk passing into it, exposed as it is to all the obstructive influences of the different motions of the limb. After the main artery has been permanently obstructed, the anastomosing vessels enlarge, so as to compensate for the loss; but after a time, only those whose course most resembles the parent trunk continue enlarged, and the others gradually regain their ordinary dimensions.

An idea of the profusion of this anastomosing system may be formed from the fact that if the innominate artery, or great vessel destined for the supply of the right upper half of the body, be tied, and those on the left side injected with size and vermilion, the injection will flow freely into the arteries of the right arm, through branches as minute as they are numerous.

**ANATHEMA** (Gr., a thing set or hung up or apart—i.e., as consecrated), a word originally signifying some offering or gift to Deity, generally suspended in the temple. Thus, we read in Luke xxi. 5, that the temple was adorned "with goodly stones and gifts" (*anathemata*). It also signifies a sacrifice to God; and, as the animals devoted to be sacrificed could not be redeemed from death, the word was ultimately used in its strongest sense, implying eternal perdition, as in Rom. ix. 3; Gal. i. 8 and 9; and other places. In the Catholic church, from the 9th c., a distinction has been made between excommunication and anathematizing; the latter being the extreme form of denunciation against obstinate offenders. The synod of Pavia, in 850, determined that all transgressors who refused to submit to discipline, such as penance, should be not merely excommunicated, but anathematized, and deprived of every kind of Christian hope and consolation. Such a sentence could not be pronounced without the concurrence of the provincial bishops with their metropolitan. See EXCOMMUNICATION.

**ANATHOTH**, a t. in Palestine, 4 m. n. of Jerusalem; the birthplace of Jeremiah; a city of priests and of refuge. It was an important place, but it is now supposed to exist only in the little village of Anata, at the top of a hill n. of Jerusalem, commanding a view of the Dead sea. At A., Jeremiah bought the field as a symbol of the return from captivity.

**ANATOLIA** (Gr. Anatolē, the east, i.e., from Constantinople) is the modern name for Asia Minor; Turkish, Anadolı. It may be considered as coincident with the peninsula; the boundary line on the e. between it and Armenia and Mesopotamia, not being natural, cannot be well defined. The area of the peninsula exceeds 200,000 square miles. It constitutes the western prolongation of the high table-land of Armenia, with its border mountain-ranges. The interior consists of a great plateau, or rather series of plateaus,

rising in gradation from 2400 to 5000 ft., with bare steppes, salt plains, marshes, and lakes; the structure is volcanic, and there are several conical mountains, one of which, the Agridagh (Argæus), with two craters, rises 10,000 ft. above the plain of Kaisarijeh, which has itself an elevation of between 2000 and 3000 ft. The plateau is bordered on the n. by a long train of parallel mountains, varying from 4000 to 6000 ft. high, and cut up into groups by cross valleys. These mountains sink abruptly down on the n. side to a narrow strip of coast; their slopes towards the interior are gentler and bare of wood. Similar is the character of the border ranges on the s., the ancient Taurus, only that they are more continuous and higher, being, to the n. of the bay of Skanderun or Issus, 10,000 to 12,000 ft., and further to the w., 8000 to 9000 feet. The w. border is intersected by numerous valleys, opening upon the archipelago, through the highlands of the ancient Caria, Lydia, and Mysia, to the northern part of which mounts Ida and Olympus belong. Between the highlands and the sea lie the fertile coast-lands of the Levant. The rivers of A. are not considerable; the largest are the Yeshil Irmak (Iris), the Kisil Irmak (Halys), and the Sakkariah (Sangarius), flowing into the Black sea; and the Sarabat (Hermus) and Minder (Mæander) into the Ægean.

The *climate* wears on the whole a south-European character; but a distinction must be made of four regions. The central plateau, nearly destitute of wood and water, has a hot climate in summer, and a cold in winter; the s. coast has mild winters and scorching summers; while on the coast of the Ægean there is the mildest of climates and a magnificent vegetation. On the n. side, the climate is not so mild, nor the productions so tropical a kind as on the w.: yet the vegetation is most luxuriant, and a more delightful or richer tract than the coast from the sea of Marmora to Trebizond, is hardly to be found. The whole peninsula, however, is liable to earthquakes.

In point of natural history, A. forms the transition from the continental character of the east to the maritime character of the west. The forest-trees and cultivated plants of Europe are seen mingled with the forms peculiar to the east. The central plateau, which is barren, except where there are means of irrigation, has the character of an Asiatic steppe, more adapted for the flocks and herds of nomadic tribes than for agriculture; while the coasts, rich in all European products, fine fruits, olives, wine, and silk, have quite the character of the s. of Europe, which on the warmer and drier s. coast shades into that of Africa.

The inhabitants consist of the most various races. The dominant race are the Osmanli Turks, who number about 1,200,000, and are spread over the whole country; next to these come the Turkomans, belonging to the same stock, and speaking a dialect of the same language. These are found chiefly on the table-land, leading a nomadic life; there also live hordes of nomadic Kurds. Among the mountains e. of Trebizond are the robber tribes of the Lazæ. The population of the towns, in addition to Turks, consists, in the w., chiefly of Greeks and Jews; and in the e., of Armenians; the non-Turkish population, along with Europeans in the maritime parts, have the whole commerce of the country in their hands. The whole population of the peninsula is supposed not to exceed 5,000,000; the latest official census available made it 10,907,000, including Armenia; but this is thought to be much overestimated. The political and social arrangements are much as in the rest of Turkey (q.v.). One peculiarity is the old Turkish system of vassal-dynasties, the Dere-begs (valley chiefs), who, like the feudal lords of the middle ages in Europe, are hereditary rulers and military commanders of their district, under the suzerainty of the sultan. This institution is in greatest force in the n.e. of the peninsula. The power of these feudal chiefs, however, was broken by Sultan Mahmud.

The whole country is divided at present into eight *eyalets* or governments, under governors-general, and each of these again, into several *sandjaks*, or provinces, under lieutenant-governors. The *eyalets* are: 1. Khudavendkiar, in the n.w., including ancient Mysia, the w. part of Bithynia, and part of Phrygia; chief t. Brussa: 2. Kastamuni, occupying the middle of the n. coast, including ancient Paphlagonia, the e. of Bithynia, and part of Pontus; chief t., Kastamuni: 3. Tarabosan or Trabezun (Trebizond), the ancient Pontus and Colchis; capital, Trebizond: 4. Aïdin, in the s.w., the ancient Lydia, Caria, and Phrygia; capital, Isniir or Smyrna: 5. Konia, formerly Karamania, eastward from Aïdin, the ancient Lycia, Pamphylia, Pisidia, Lycaonia, and part of Cilicia; chief t., Konieh (Iconium): 6. Adana, comprehending the rest of Cilicia, Kataonia, and part of Cappadocia; chief t., Adana: 7. Angora, the central part of the peninsula, ancient Cappadocia and Galatia; chief t., Enguri or Angora: 8. Sivas, e. from Angora, embracing parts of Pontus and little Armenia; chief t., Sivas.

**ANATOMY** (Gr., a cutting up or dissecting) is the science of the form and structure of organic bodies, and is practically acquired by separation of the parts of a body, so as to show their distinct formation, and their relations with each other. It is generally understood as applied to the human body, while the A. of animals is styled ZOOLOGY, and that of plants, PHYTOLOGY. The investigation and comparison of the structures of the different kinds of organic bodies is styled COMPARATIVE A. Theoretical A. is divided into GENERAL and SPECIAL.

GENERAL A. gives a description of the elementary tissues of which the systems and organs of the body are composed, as preliminary to an examination of them in their combined state in the various organs: it also investigates their laws of formation and combi-

nation, and the changes which they undergo in various stages of life. This branch of study may also be styled structural or analytical A., and has been first developed in recent times, especially by Bichat (1801) and Bordeu, who have been followed by J. Müller, Goodsir, Mayer, E. H. Webber, Schwann, Valentin, and many others. In our day, microscopic investigation has been successfully applied to the study of elementary textures. See HISTOLOGY.

**SPECIAL A.** (styled descriptive by the French writers) treats of the several parts and organs of the body in respect to their form, structure, and systematic connection or relation with each other. The arrangement of the several parts and organs in an order deduced from their similarity in structure or use, constitutes **SYSTEMATIC A.** According to this mode of study, which is essential as an introduction to physiology, A. has been divided, though not with scientific precision, into six branches of study. 1. *Osteology*, which treats of the bones, including the cartilages of the joints (chondrology).—2. *Synsplanchnology*, which describes the ligaments, or bands, that unite the bones of various joints. The bones, with their cartilages and ligaments, form a framework, which supports the external soft parts, and within which the vital organs are suspended and protected from injury; they are also arranged in a mechanical system as instruments of motion.—3. *Myology* explains the system of the muscles, which, by their contractile power, serve to impart motion to the bones and joints; while, like the bones, they contribute to form the cavities of the body, and to protect the internal organs. Their structure also serves to produce the external shape and symmetry.—4. *Angiology* describes the vessels or ducts, with their complex net-work and ramifications, spreading over most parts of the body, and divided into two great systems: (a), the blood-vessels with the heart, a fleshy organ propelling the blood through the pulsating vessels or arteries, from which it returns to the heart, after circulation through the veins; (b), the lymphatics, by which a certain fluid (lymph) is brought into union with the blood in the organs styled lymphatic glands, and is afterwards passed into the veins.—5. *Neurology*, or the doctrine of the nerves, describes the nervous system, as divided into *first*, the two central masses of the brain and the spinal column; *second*, the ramification of nerves running from the brain and spinal column to almost all points of the surface; and *lastly*, the order of nerves having a peculiar structure, and styled the ganglionic system of nerves.—6. *Splanchnology* describes the viscera, or organs formed by combination of the distinct systems of veins, nerves, lymphatics, etc., and mostly situated in the cavities of the body. These are divided into five groups, viz.: (a), the organs of sensation—sight, hearing, smell, taste, and touch; (b), of voice and respiration—nostrils, mouth, larynx, trachea, and lungs, with the thyroid gland, the thymus gland, and the diaphragm; (c), digestive organs—the mouth, with its salivary glands, the throat, gullet, the stomach, the intestines, with the liver, spleen, and pancreas; (d), the urinary organs—kidneys, ureter, bladder, and urethra; (e), sexual organs of both sexes.

Special A. may be treated in another mode: by an arrangement made in accordance with natural divisions, or by imaginary lines dividing the body into several regions—as the head, the trunk, and the extremities. Again, the trunk may be subdivided into neck, thorax, and abdomen; and in each of the main regions, several subdivisions may be made. This system of arrangement may be styled **TOPOGRAPHICAL A.**, and is also known as **SURGICAL A.**, on account of its importance as the basis of operative surgery. It was the eldest of the Monroes of Edinburgh University who first gave this branch of the study its due prominence.

The several parts and organs of the animal body will be found described under their proper heads.

*History of A.*—It is difficult to determine the date at which this science began to be cultivated, but it is probable that from the earliest times some persons took advantage of favorable circumstances to acquaint themselves with it. The Druids, who were at once the priests, judges, and physicians of the people, demanded from those who came for their advice human victims as sacrifices, and were themselves the executioners; and it is not unlikely that they availed themselves of these opportunities of acquiring anatomical knowledge. It is probable, says Galen, that Æsculapius, who excelled in the treatment of wounds, dissected animals for the instruction of his pupils. His descendants, the Asclepiades, cultivated A., or rather zootomy, and founded the three famous schools of Cos, Rhodes, and Cnidos. The rabbins tell us that, although among the Jews the touching of a dead body involved ceremonial uncleanness, they did not entirely neglect A., which they studied from the carefully preserved bones of their ancestors, and the necessary manipulations of embalming. They counted 248 bones, and 365 veins or ligaments, which division, according to the rabbins, has relation to the 248 precepts of the Mosaic law that *command*, and the 365 that *forbid*.

Homer exhibits a certain amount of anatomical knowledge in his description of wounds in the *Iliad*. Pythagoras first reasoned physiologically from observations made by him when in Egypt, where he witnessed the sacrifices, and also the Egyptian methods of embalming. Alcmeon of Crotona, a disciple of Pythagoras, first dissected animals with the view of obtaining comparative knowledge of human A. Democritus, who frequented the sepulchres, probably with anatomical views, practiced zootomy, and was engaged dissecting animals when visited by Hippocrates. Hippocrates II., descended in the eighteenth degree from Æsculapius, and born at Cos in 35 A.M., was the first author

who treats A. as a science. He caused a skeleton of brass to be cast, which he consecrated to the Delphian Apollo, with the view of transmitting to posterity proofs of the progress he had made, and of stimulating others to the study of A. Aristotle, who lived 384 B.C., does not appear to have dissected men; and he states that the parts of man are unknown to them, or that they possess nothing certain on the subject beyond what they can draw from the probable resemblance of the corresponding parts of other animals. He first gave the name *aorta* to the great artery.

Diocles (380 B.C.) was the first who treated of the proper manner of conducting anatomical examinations for purposes of demonstration. But no real progress in A. was made, owing to the researches being confined to animals, till the time of Erasistratus, who was b. at Ceos about 300 B.C., and who was the first to dissect human bodies. He obtained from Seleucus Nicanor and Antiochus Soter the bodies of criminals, and is said to have dissected some condemned to death while they were still alive. His writings are lost, but fragments are preserved in the writings of Galen. He made many discoveries, among others, of the lacteal vessels. Herophilus, who lived about the same time, was b. at Carthage, but carried on his anatomical pursuits principally at Alexandria. He also is said to have dissected living subjects. Parthenius, who lived 200 years B.C., published a book, entitled *On the Dissection of the Human Body*. In the first chapter of the Christian era, the dissection of human subjects was forbidden, under heavy penalties. Rufus the Ephesian, who lived 112 A.D., under the empire of Trajan, taught A. in a more exact manner than had been hitherto done, and devised a more exact anatomical nomenclature. He made use of animals in his demonstrations, and mentions that "of old they used for that purpose human bodies."

Galen (131 A.D.) dissected apes, as being most like human subjects, though he occasionally obtained bodies of children exposed in the fields, or of persons found murdered, which, however, he was obliged to dissect in secret. There was at this time no regularly prepared skeleton, as there was a law at Rome forbidding the use of dead bodies. Galen's writings show a knowledge of human A. Soranus had extensive knowledge of A., derived from human subjects. Moschion had some anatomical illustrations engraved. Oribasius compiled more than 70 volumes, the 24th and 25th being on A., principally from Galen.

Nemesius, bishop of Nemesus, a t. in Phœnicia, cultivated A. at the end of the 4th c., in which also Meletius lived, who wrote a complete treatise *On the Nature and Structure of Man*. Theophilus, a monk, published in the 7th c. a good abridgment of the A. of Galen.

A. made small progress among the Arabs, which is accounted for by their religion prohibiting contact with dead bodies. When the great Arabian physician, Rhazes, was about to be operated on for cataract, he discovered that the surgeon was ignorant of the structures of the eye, and refused to submit to the operation. Avicenna (980 A.D.), b. in the province of Khorasan, was a good osteologist, and described some structures not alluded to by Galen.

A. was now neglected for a long period, till Frederick II., king of Sicily (1194-1250), made a law forbidding any one to practice surgery without having first acquired some knowledge of A. He founded a chair at the solicitation of Martianus, his chief physician, where the science was demonstrated for five years; students from all parts crowded to it, and, some time after, a similar school was established at Bologna—these two were largely attended, but no very material progress was made in A.

The university of Montpellier was founded by pope Nicholas IV. in 1284, and the chair of A. was filled by Bernard Gordon with great distinction for ten years. He published a huge work, called *Litium Medicina*.

Mundinus, b. at Milan, 1315, professed A. there, and is considered the real restorer of A. in Italy. He publicly demonstrated it, and published a work which was the text-book in the academy of Padua 200 years after its publication. Then came Guy de Chauliac, who first correctly described the humerus. Mathæus of Grado published several anatomical works about 1480. Gabriel de Zerbus, in 1495, published a confused and imperfect work on A. at Verona. The science continued to be studied by surgeons such as Vigo (1516), Achillinus, and Berenger (Carpi), (1518), who boasted of having dissected at Bologna more than a hundred subjects. Reports were raised that he dissected living Spaniards, and he fled or was exiled to Ferrara.

André Lacuna (1535), Charles Etienne, Gonthier (1536), Massa, Driander (1537), Sylvius (1539), Levasseur, and Gesner, were celebrated for A.; but especially Andrew Vesalius, b. 1514, who published a great work on A. before he was 28 years of age. He had the misfortune to open the body of a young Spanish nobleman whose heart was found still beating, and was obliged to make an expiatory pilgrimage to Jerusalem. In 1564, the Venetian senate recalled him to succeed at Padua, the famous Fallopius, who had just died; on his return, he was shipwrecked on the island of Zante, where he was starved to death.

William Horman of Salisbury wrote, in 1530, *Anatomia Corporis Humani* (A. of Human Body); then came Ingrassias, and others of less note.

Thomas Gemini of London, in 1545, engraved upon copper the anatomical figures of Vesalius, which had appeared in Germany upon wood. Gemini suppressed the name of Vesalius, though using his figures and descriptions. Thomas Vicary, in 1548, is said

to be the first who wrote in English on A.; he published *The Englishman's Treasure, or the True A. of Man's Body*. John Ligæus, in 1555, published an anatomical treatise in Latin hexameters. Franco (1556), Valverde, Columbus, and others, wrote works of great merit on A. In 1561, Gabriel Fallopius professed it with great distinction at Padua, and made many original discoveries.

In the 17th c., progress was rapid: Hervey, in 1619, discovered the circulation of the blood, and the microscope was employed to detect the structure of minute vessels. Aselli, in 1632, discovered and demonstrated the existence of the lymph-vessels; and his conclusions were supported by the investigations of Pecquet, Bartholin, and Olaus Rudbeck. The glandular organs were investigated by Wharton, while Malpighi, Swammerdam, and (in the following century) the illustrious Ruysch, by the use of injections and the aid of the microscope, gave a new impulse to research in the minute structures. Eminent names in the history of A. are numerous in the 18th century. In Italy, which still retained its former pre-eminence, we find Pacchioni, Valsalva, Morgagni, Santorini, Mascagni, and Cotunni; in France, Winslow, D'Aubenton, Lieutaud, Vicq d'Azyr, and Bichat, the founder of general A.; in Germany, the accomplished Haller and Meckel prepared the way for greater achievements in the 19th c.; in Great Britain, Cowper, Cheselden, Hunter, Cruikshank, Monro, and Charles Bell contributed to the progress of the science; while Holland was worthily represented by Boerhaave, Albinus, Camper, Sandifort, and Bonn. On the boundaries of the two centuries, we find the names of Sömmerring, Loder, Blumenbach, Hildebrand, Reil, Tiedemann, and Seiler; nearly all connected with practical medicine, which was benefited by their studies in A.

The necessity of a union of theory and practice has led to that zealous study of PATHOLOGICAL A. (the dissection and study of structures as modified by diseases) which has recently prevailed. The origin of this branch of A. may be traced back to ancient times in Egypt, where post-mortem examinations were sometimes made to discover the seat of disease and cause of death. In the medical writings of the Greeks, some anatomico-pathological observations are found. During the general revival of science in the 16th c., many notices of pathological A. occur. In 1507, Benevieni of Florence wrote the first book on this branch of science; and Bonet, in 1679, published his compilation of numerous observations. Still, these were only fragmentary indications of a possible science, and the facts stated were often very erroneously interpreted. Morgagni (1707), who must be regarded as the true founder of pathological A., was worthily followed by Lieutaud, Sandifort, Hunter, Baillie, and others. Meckel the younger, in Germany, in his study of malformations, etc., paid little or no attention to practical applications of the science. The recent change of direction given to the study of pathological A., which is now properly regarded as a means towards practical improvements in medicine, must be ascribed to Bichat and the pupils of Broussais, among whom may be mentioned the names of Laennec, Cruveilhier, Louis, Andral, Lobstein, Lebert, Virchow, Bennett, etc. In London and other large towns there are societies devoted specially to the investigation of pathology.

COMPARATIVE A. has always preceded anthropotomy, or dissection of the human subject, but was first treated systematically as a distinct science by Cuvier and his pupil Meckel the younger. The system proposed by the latter was, unfortunately, never completed. Blumenbach, Tiedemann, Home, Blainville, Geoffroy St. Hilaire, Carus, Oken, Goethe, the German poet, Richard Owen, John Goodsir, and Huxley, must be named as eminent contributors to this branch of science, while, in late years, zootomy and comparative A. have been studied, with an especial reference to physiology, by Müller, Wagner, Siebold, Bowman, Todd, and Allan Thomson.

A. FOR ARTISTS is studied with reference to the effects produced by internal structure on the external form, and describes the organs, especially the muscles and tendons, not only in a state of rest, but also as modified by passion, action, and posture. Consequently, observation of the nude living form is required in this branch of study, which has been treated of by Errard and Genga (1691); and in modern times, by Lavater (1790), Camper (1792), Charles Bell (1806), Salvage (1812), Mascagni (1816), Koeck (1822), Gardy (1831), Fischer (1838), Salomon and Aulich (1841), Berger (1842), Seiler and Günther (1850), etc.

PRACTICAL A. includes *dissection* (q.v.) and the making of *preparations*. *Preparation* consists in dividing parts or organs, so that their respective forms and positions may be clearly shown. Organs or parts thus treated are styled *anatomical preparations* of bones, muscles, vessels, nerves, etc. For example, a bone preparation is made by clearing away all muscular and other adhesions; the whole structure of the bones, thus prepared and bleached, when connected by wires in its natural order, forms an artificial *skeleton*.

For preparations of parts containing vessels with minute ramifications, injections are employed. Some colored fluid which has the property of gradually becoming solid, is gently injected into the arteries or other vessels, by means of a syringe. Formerly, materials which required a certain degree of warmth to preserve their fluidity were used; but as these were attended with inconvenience, a great improvement was made by Shaw and Weber, who introduced the use of linseed oil and turpentine, which, when mixed with certain metallic compounds in due proportions, form a fluid which,

after a time, becomes solid in ordinary temperatures. Quicksilver and colored lime-water are also used for injection of the finer vessels. Preparations are either dried and varnished or preserved in spirit.

A series of such specimens, arranged in proper order, forms an *anatomical museum*. The valuable collections made by Ruysch, Rau, Loder, Walter, John and William Hunter, Meckel, Sömmering, and Dupuytren, are all now public property. There is also a splendid collection in the university of Edinburgh, collected and prepared for the most part by John Goodsir. The college of surgeons of Edinburgh also possesses a very valuable museum of pathological preparations. As it is impossible to preserve thus all parts in their integrity for any great length of time, artificial copies in wood, ivory, and wax, have been made with great exactitude, especially in Florence; and recently Anzou, in Paris, has employed *papier-mâché* for the same purpose. But, apart from dissections and preparation of the natural organs, the most general and available assistance in the study of A. is found in anatomical engravings and plates on wood and copper. This assistance was known in ancient times. Aristotle affixed to his works on A. some anatomical drawings, which have been lost. In the 16th c., the greatest artists—Leonardo da Vinci, Michael Angelo, Raphael, Titian, and Dürer—gave their aid in designing anatomical figures; but few of their works, in this department of art, have been preserved. Lately, lithography has been employed. Among the numerous illustrations of A. which we now possess, the old works by Vasal (1543), Eustachius (1714), Bidloo (1685), Albin (1747), Haller (1743-1756), and Vicq d'Azyr (1783-1790), may be mentioned. The present century has supplied works of first-rate excellence by Caldani (Venice, 1801-1814), Mascagni (Pisa, 1823), Langenbeck (Göttingen, 1826), Bourguery and Jacob (Paris, 1832), and Arnold (Zürich, 1838). For general use, we may commend the plates of Loder (Weimar, 1803), Cloquet (Paris, 1826), Oesterreicher (Munich, 1827-1830), Weber (Düsseldorf, 1830), Bock (Leipsic, 1840), and D'Alton (Leipsic, 1848): in surgical A., the works by Roscnmüller (Weimar, 1805), Pirogoff (Dorp, 1840), and Günther (Hamburg, 1844): in pathological A., Meckel (Leipsic, 1817-1826), Cruveilhier (Paris, 1828-1841), Froriep (Weimar, 1828), Albers (Bonn, 1833), Gluge (Jena, 1843-1850), and Vogel (Leipsic, 1843): in comparative A., Carus (Leipsic, 1826) and Wagner (Leipsic, 1841). Among English works may be mentioned those by Lizars, Jones, and Richard Quain, in special A.; by Morton and MacLise, in surgical A.; and by Baillie and Bright in pathological A.

**ANATOMY** (in law). While the study and practice of A., or the art of dissecting the human body, were necessary to the pursuit of surgical knowledge, there were, until the year 1832, no sufficient legal means in Britain of procuring dead bodies for anatomical purposes; and the consequence was, the evasion, and sometimes even the open violation of the law by persons interested in supplying the surgical profession with subjects for dissection. The high prices, indeed, given for these subjects, may almost be said to have created a lucrative and tempting trade, which led to the most atrocious crimes; and murders, with no other object than the possession of the victim's body for the surgeon's knife, were frequently committed. The notorious case of Burke, tried and convicted before the high court of judicature in Edinburgh, in 1828, is a horrible illustration of the state of the law at that time, and of the position in which it placed surgical practitioners. It was believed that Burke and his associate Hare had been the murderers of sixteen persons, whose bodies they sold to the anatomists. It was their practice to inveigle poor people, generally strangers, into their houses, make them drunk, and then smother them. Burke, informed against by Hare, was condemned for thus disposing of an old woman, and suffered the last penalty of the law, bequeathing a new verb, *to burke*, to the English language. To remedy this state of things, an act of parliament was passed on the 1st of Aug., 1832, 2d and 3d William IV. c. 75, the preamble of which, sufficiently disclosing its necessity, is as follows: "Whereas, a knowledge of the causes and nature of sundry diseases which affect the body, and of the best methods of treating and curing such diseases, and of healing and repairing divers wounds and injuries to which the human frame is liable, cannot be acquired without the aid of anatomical examination: and whereas, the legal supply of human bodies for such anatomical examination is insufficient fully to provide the means of such knowledge: and whereas, in order further to supply human bodies for such purposes, divers great and grievous crimes have been committed, and, lately, murder, for the single object of selling for such purposes the bodies of the persons so murdered: and whereas, therefore, it is highly expedient to give protection, under certain regulations, to the study and practice of A., and to prevent, as far as may be, such great and grievous crimes and murder as aforesaid"—It is therefore enacted, that the secretary of state for the home department in Great Britain, and the chief secretary in Ireland, may grant a license to practice A. to any fellow or member of any college of physicians or surgeons, or to any graduate or licentiate in medicine, or to any person lawfully qualified to practice medicine in any part of the United Kingdom, or to any professor or teacher of A., medicine, or surgery, or to any student attending any school of A., on the application of such party for such purpose, countersigned by two justices of the peace acting for the county, city, borough, or place where such party resides, certifying that, to their knowledge or belief, such party so applying is about to carry on the practice of A. The act provides for the appointment of inspectors of

schools of A., and directs them to make a quarterly return to the secretary of state, or the chief secretary, as the case may be, of subjects removed for anatomical examination to every place in the inspector's district where A. is carried on, distinguishing the sex, and, as far as is known at the time, the name and age of each person whose body was so removed. The inspectors are further required to visit and inspect places within their respective districts where A. is practiced; and for the performance of all these duties, the inspectors are each to have an annual salary not exceeding £100, with a further reasonable sum for their official expenses. By section 7, it is enacted that it shall be lawful for any executor or other party having lawful possession of the body of any deceased person, and not being an undertaker or other party intrusted with the body, for the purpose only of interment, to permit the body of such deceased person to undergo anatomical examination, unless, to the knowledge of such executor or other party, such person shall have expressed his desire, either in writing, at any time during his life, or verbally, in the presence of two or more witnesses, during the illness whereof he died, that his body, after death, might not undergo such examination; or unless the surviving husband or wife, or any known relative of the deceased person, shall require the body to be interred without such examination: while, by section 8, it is declared that the wishes of persons who had expressed a desire that their bodies should be subjected to anatomical examination shall be respected, unless the deceased person's surviving husband or wife, or nearest known relative, or any one or more of such person's nearest known relatives being of kin in the same degree, shall require the body to be interred without such examination. Bodies are not to be removed for examination until 48 hours after death, and without a certificate by the medical attendant, stating, according to the best of his knowledge or belief, the manner or cause of death. The act contains a number of provisions intended to secure its sufficient administration; but, by section 15, it is provided that it shall not extend to or prohibit any post mortem examination of any human body required or directed to be made by any competent legal authority; and it repeals an enactment in a previous statute, 9 George IV. c. 81, which directed the bodies of murderers after execution to be dissected.

This act of parliament is understood to have met the evil it was designed to obviate; and under it the supply of bodies of persons dying friendless, in poor-houses, hospitals, and elsewhere, is stated to have proved sufficient for the wants of the profession.

**ANAXAGORAS**, one of the most eminent philosophers of the Ionic school, was b. at Clazomenæ, in Ionia, 500 B.C. He belonged to a wealthy and distinguished family, which circumstance may have enabled him to devote himself exclusively to intellectual pursuits. Yet he does not seem to have entered into the possession of his property, but left it to his relations. When only 20 years of age, he went to Athens, where, in the course of time, he acquired a high reputation, and had several illustrious pupils, among whom were Pericles, Euripides, Socrates, and Archelaus. But at last, being accused of impiety towards the gods, he was condemned to death. His sentence, however, was commuted into banishment for life, through the eloquence of Pericles. He withdrew to Lampsacus on the Hellespont, where he died in the 73d year of his age. The old man was accustomed to say proudly, in his exile: "It is not I who have lost the Athenians, but the Athenians who have lost me." When on his death-bed, the magistrates of the town asked what funeral honors he desired; "Give the boys a holiday," was the quaint reply of the sage; and for several centuries the day of his death was commemorated in all the schools of Lampsacus.

It is not easy to ascertain what were the opinions of A. in philosophy. Fragments merely of his works have been preserved, and even these are sometimes contradictory. Of one thing we are certain, that he had a deeper knowledge of physical laws than any of his predecessors or contemporaries. The absurdities of opinion which are attributed to him are no proof of the contrary, for, in his time, any attempt to explain even a moderate number of the phenomena of nature was sure to be attended with what everybody now sees to be extravagant fictions. He believed the heavens to be a solid vault; the stars to be stones thrown up from the earth by some violent convulsion, and set on fire by the ether which ever burns in the upper regions of the universe; the milky-way to be the shadow of the earth; that the soul had an aerial body; that the sun was a burning mass of stone, larger than the Peloponnesus. But he also arrived at some tolerably accurate conclusions regarding the cause of the moon's light, of the rainbow, of wind, and of sound. His great contribution to ancient philosophy, however, was his doctrine as to the origin of all things. He held that all matter existed originally in the condition of atoms; that these atoms, infinitely numerous, and infinitely divisible, had existed from all eternity, and that order was first produced out of this infinite chaos of minutiae through the influence and operation of an eternal intelligence (*Gr. nous*). He also maintained that all bodies were simply aggregations of these atoms, and that a bar of gold, or iron, or copper, was composed of inconceivably minute particles of the same material; but he did not allow that objects had taken their shape through accident or blind fate, but through the agency of this "shaping spirit" or *Nous*, which he described as infinite, self-potent, and unmixed with anything else. "*Nous*," he again says, "is the most pure and subtle of all things, and has all knowledge about all things, and infinite power." A.'s theory is thus only one step from pure theism. He makes the work of the Eternal commence with providence, not with creation.

The fragments of A. have been collected by Schaubach (Leipsic, 1827), and by Schorn (Bonn, 1829).

**ANAXARCHUS**, of Abdera. He was with Alexander in the Asian expedition, and is supposed to have been a friend and counselor, checking the conqueror's vainglory, and consoling his grief when he had slain Clitus.

**ANAXIMANDER**, a Greek mathematician and philosopher, the son of Praxiades, and the disciple and friend of Thales, was b. at Miletus 610 B.C., and d. in 546. His principal study was mathematics. He is said to have discovered the obliquity of the ecliptic, and certainly taught it. He appears to have applied the *gnomon*, or style set on a horizontal plane, to determine the solstices and equinoxes. The invention of geographical maps is also ascribed to him. As a philosopher, he speculated on the origin (*arche*) of the phenomenal world, and this principle he held to be the infinite or indeterminate (*to apeiron*). This indeterminate principle of A. is generally supposed to have been much the same with the chaos of other philosophers. From it he conceived all opposites, such as hot and cold, dry and moist, to proceed through a perpetual motion, and to return to it again. Of the manner in which he imagined these opposites to be formed, and of his hypothesis concerning the formation of the heavenly bodies from them, we have no accurate information. It would seem, however, that he did not believe in the generation of anything in the proper sense of the word, but supposed that the infinite atoms or units of which the *arche*, or primary matter, is composed, merely change their relative positions in obedience to a moving power residing in it. Some of his particular opinions were that the sun is in the highest region of the heavens, is in circumference 28 times greater than the earth, and resembles a cylinder from which flow continual streams of fire; that eclipses are caused by the stopping of the openings from which the fire flows; that the moon is also a cylinder, 19 times greater than the earth; and that the moon's phases are caused by obliquity of position, and eclipses by complete turning round. He taught that the earth is of the form of a cylinder, and that it floats in the midst of the universe, that it was formed by the drying up of moisture by the sun, and that animals are produced from moisture.

**ANAXIMENES**, a Greek philosopher, b. at Miletus, flourished about 556 B.C. He held *air* to be the first cause of all things, or the primary form of matter, from which all things are formed by compression.

**ANAXIMINES**, a Greek historian, b. in Lampsacus, Asia Minor, in the 4th c. B.C.; a pupil of Zoilus and Diogenes; said to have taught Alexander rhetoric, and to have accompanied him in the Persian expedition. He wrote histories of Philip of Macedon, of Alexander, and of Greece, of which a few fragments exist.

**ANBURY**, a disease to which turnips are liable, and which often proves of serious importance to farmers, destroying the crop of entire fields. It is sometimes called *club-root*, because of the knobs or tubercular excrescences which form upon the root. The root, instead of swelling into one turnip of good size, generally becomes divided into a number of parts, each in some small degree swelling separately by itself; whence the popular name, *fingers and toes*. The growth of the plant is arrested; the root becomes woody; the excrescences rot, and emit most offensive effluvia, which, however, appear peculiarly attractive to insects of various kinds; and, accordingly, eggs and maggots in abundance are soon to be found in them. It has been very generally supposed that these insects, or some of them, are the cause of the disease; but the truth seems rather to be that they are attracted by the diseased state of the plant. A. has been erroneously confounded with the excrescences, each containing a small grub, which are frequent on the roots of turnips, as on those of cabbages, and many other cruciferous plants, although these also sometimes effect the destruction of the plant. The true nature and cause of the disease are not yet well known. Much attention has been devoted to the subject; and premiums have been offered in connection with it by the highland and agricultural society of Scotland; but hitherto, without eliciting any certain or satisfactory information. It appears probable that the disease is in some measure owing to peculiarities of soil, or of manure, and to the too frequent repetition of turnip-crops upon the same field. A much greater frequency of repetition, however, can be safely practiced in some districts, or in some fields, than in others. The liberal application of lime has been found advantageous as a preventive of A.; but even this often succeeds but imperfectly; and the increasing prevalence of this disease in certain districts seems not unlikely to necessitate a considerable modification in the system of husbandry, in which the turnip-crop has long occupied so important a place. See **TURNIP**.

**ANCACH**, the n.w. department of Peru, between the Andes and the Pacific; about 18,000 sq.m.; pop. 317,000; very productive in cereals, sugar, and cotton. Marble and minerals abound. The capital is Huaras, in an extensive and populous valley. Other cities are Huaylas, Santa, Huari, Cajatambo, Panabamba, and Pallaca, each the capital of a province of the same name. Through the passes in this department the Colombian army of the war of independence made its wonderful march to fall upon the Spanish forces at Junin.

**ANCAS'TÉ**, a t. of the Argentine Republic, S. A., in the province of Catamarca, 23 m. n.e. from Catamarca. Pop. about 8900.

**ANCELOT**, JACQUES-ARSÈNE-POLYCARPE-FRANÇOIS, a French poet, b. Feb. 9, 1794, at Havre, where his father was clerk of the chamber of commerce. The latter being a well-informed gentleman, delighting in verse, early taught his son to recite passages from the French poets. A. was from the first intended for active life in connection with the administration of the navy; and was employed, until the revolution of July, in the government service. His reputation was first established in 1819 by his tragedy of *Louis IX.*, which was played fifty nights in succession, and procured him a pension of 2000 francs from the king. His next piece, *The Mayor of the Palace* (1822), was not so well received. In 1824, appeared his *Fiesque*, a work which exhibited the great skill of the author in adapting a masterpiece of Schiller to the French stage. In 1825, he gave to the world an epic poem in six cantos, *Marie de Brabant*; and in 1827, a clever and graceful work, partly prose and partly verse, entitled *Six Months in Russia*; besides a novel in four volumes, *The Man of the World*. *Oiga*, a drama, was published in 1828; and *Elizabeth of England* in 1829. Both of these works were highly successful, though neither met with the brilliant reception of *Louis IX.* In 1834 appeared *Les Emprunts aux Salons de Paris*. The revolution of July deprived him of his pension, and also of his situation as librarian at Meudon; and for the next ten years he was compelled to support himself and family by the concoction of numberless *vaudevilles*, dramas, comedies, anecdotes, etc., sometimes of very questionable morality. In 1841, the French academy chose him as the successor of Bonaud. Shortly after appeared his *Familiar Letters* (*Épîtres Familiales*), a collection of satires as remarkable for freshness of epigram as for grace of style and richness of versification. In 1848, he published *La Rue—Quincampoix*. He d. in 1850.

A's *chief-d'œuvre*, *Louis IX.*, is a work of genius; the versification is correct, elegant, and harmonious; the manners and characters of the period are delineated with great fidelity and brilliancy: the plot is skillfully constructed; and some of the scenes are contrived with singular felicity.

**ANCELOT**, MARGUERITE LOUISE VIRGINIE CHARDON, a French novelist and dramatist, wife of Jacques A., b. Mar. 15, 1792. She greatly aided her husband in his dramas, and produced several comedies of her own, in all 20 plays, besides many novels which were popular. She was also an amateur painter. In 1828, she exhibited *Un Lécureur de M. Ancelot*, which was much talked about for its portraits of Parisian celebrities.

**ANCHISES**, in legend, the son of Capys and Themis, the founder of Ilium; from many indications supposed to have come from Assyria. Venus was enamored of his beauty, and by him became the mother of Æneas, whose maternity A. was not to disclose; but he did so, and was killed by a bolt from Jupiter—some say only blinded. His son bore him on his shoulders, fleeing at the destruction of Troy, and he is heard of in Italy, Sicily, and elsewhere. There was a grave on Mt. Ida said to be his, and he had a sanctuary at Egesta, in Sicily.

**ANCHITHEURIUM**, an extinct quadruped of the miocene, now thought to represent a genus distinct from but analogous to the horse. The shaft of the ulna is complete and separate from the radius; the fibula and tibia are attached; the short crowns of the molars lack cement, and the teeth are inserted by distinct fangs. The foot has three digits, the middle being largest, and all reach the ground.

**ANCHOR**, an implement for retaining a ship in a particular spot, by temporarily chaining it to the bed of a sea or river. Many forms of A. were made by the ancients; some were merely large stones; others, crooked pieces of wood, weighted to make them sink in water, the earlier ones acting mainly as weights, and holding the vessel by their own inertia instead of hooking into the ground. The first *iron* anchors are supposed to have been used by the Greeks. As originally made, the A. had only one fluke or arm for penetrating the ground, but a second was afterwards added; it had no stock (presently to be described), and was, on that account, ill suited for insuring a firm gripe into the ground when lowered. The Greek vessels had several anchors, one of which, called the "sacred A.," was never let go until the ship was in dire distress. Of whatever form and material the ancient anchors were made, they were lowered from the ships' sides by ropes—chain cables being a modern invention.

The maritime nations of Europe, and the United States of America, employ anchors bearing a good deal of general resemblance one to another. A large-sized modern A., regarded irrespectively of improvements recently introduced, comprises the following parts: The vertical or supporting beam of the A. is the *shank*, B; at the upper end of it is a *ring*, r, or a shackle, and just below the ring is a transverse piece called the *stock*, ss; the other extremity is the *crown*, c, from which branch out two *arms* or *blades*, g, in directions nearly at right angles to that of the stock; each arm spreads out into a broad *palm* or *fluke*, h, the sharp extremity of which is the *peak* or *bill*, k. All these parts bear special relation to the fast-holding of the A. in the ground. When the A. is let go from the ship's side, the crown first strikes the ground; it then falls over in such a manner that one end of the stock rests upon the ground; and the subsequent movements of the ship and the cable cause one or other of the flukes (it matters not which) to dig verti-

cally into the ground, and maintain a firm hold. On the firmness of this gripe depends the safe anchoring of the ship; and the sizes of all the different parts of the A., as well as the curve of the arms and flukes, are calculated with direct reference to this condition. The most favorable angle between the face of the flukes near their extremities and the shank has been found to be about  $45^\circ$ —that is, the planes of the two flukes should lie approximately at right angles to each other.

The number of anchors in British ships-of-war is in general four—the “best bower,” the “small bower,” the “sheet,” and the “spare.” For particular and special services, there are also the “stream” and the “kedg,” which are usually carried “in-board.” Smaller vessels have fewer and smaller anchors; and the “stream” A. of a large ship may conveniently serve as the “bower” for a smaller, the difference between bower, sheet, and spare anchors being rather in size than in design. Lloyd’s rules prescribe the number and weight of anchors which must be carried by ships of different sizes registered in their list, as well as the size and length of their cables, hawsers, and warps. A 200-ton vessel must have 3 “bowers,” 1 “stream,” and 1 “kedg” A.; vessels from 250 to 1800 tons carry an additional “kedg,” and those above 2000 an additional “bower” also. Steamers are only required to carry the anchors and cables which belong to a sailing vessel of two thirds their total tonnage.

Many important improvements in the shape and construction of anchors have been introduced within the last forty years. Lt. Rodgers, to increase the strength, without increasing the weight, took out a patent for *hollow-shanked* anchors; these are not strictly hollow, however, for there is a wooden core, which is bound to the iron of the shank by iron hoops. Mr. Perring introduced iron shanks made of layers of flat bars, instead of solid iron. The same inventor increased the strength of the arms, by making them in great part a curved continuation of the same pieces of iron which form the shank.

The most important novelty, however, is that introduced under Mr. Porter’s patent of 1838, seeing that it is the basis which supports all the subsequent improvements of any note. The arms are pivoted to the stock, instead of being rigidly fixed; and there is a projecting piece, called the *toggle*, on the convex part of each arm. These two additions or adjustments have a remarkable effect on the action of the A. The advantages of this A. over those of ordinary make are very considerable. There is less chance of “fouling” by the cable passing over the exposed fluke of the A. when the vessel is swinging in a tide-way; there is less danger of injury from the upper peak; the A. cannot lodge on its stock-end; it is stronger in the arm than ordinary anchors; and it is very conveniently stowed on shipboard. On the other hand, it has the disadvantage of increased complication over an A. made in one piece; its taking the ground is not so certain as with the old A.; it is extremely difficult to sweep if the cable parts; and it is somewhat awkward to fish.

Among the modifications of Porter’s A., since introduced, are those of Trotman and Honiball. Trotman’s, to which most attention is at present directed, has several advantages over Porter’s, principally in the arrangement of the palms and toggles, but it possesses the same disadvantages. This A. was for long the subject of a bitter contention between Mr. Trotman and the admiralty. In 1852, in compliance with a requisition from numerous ship-owners and underwriters, the admiralty appointed a committee, consisting of eleven experienced and impartial persons, to make trial of a large number of anchors, with a view of determining the relative merits of various forms and modes of construction. The anchors were to be similar in weight, and were to be tested in a great variety of ways—on shore, and at sea, and in reference to the holding, stowage, sweeping, tripping, fouling, etc. Most of the recently invented anchors tried were found to be better than the ordinary admiralty A.; and the one which appeared to possess the greatest number of good qualities was Trotman’s. It is beyond doubt a very good A., and is largely used in the merchant service; but the admiralty—in spite of the favorable report of their committee—have never yet felt justified in adopting any A. not made in one piece, and it is not used either in the British or (we believe) any other navy. The admiralty A. (often spoken of as Sir William Parker’s) has been of late years greatly improved in many details, chiefly by Mr. Lenox, and is probably now as perfect as a solid A. can be.

The manufacture of anchors furnished, until recent years, the most formidable exemplification of smith’s work anywhere presented, on account of the great dimensions and weight of the pieces of iron which had to be welded into one mass. The anchor-smiths wielded the most ponderous sledge-hammers known to our artisans; and the services of a large number were needed to weld the metal while in the heated and yielding state. At the present time, however, the operations are rendered very much more easy by the steam-hammer, the force of which is both greater and more easily applied than that of any available number of sledge-hammers wielded by men. At some of the government dockyards, anchor-making is conducted on a great scale; but the larger portion of the supply for the navy is obtained by contract by private firms.

We have already spoken of the sizes of anchors, etc., prescribed for merchant vessels

under Lloyd's regulations. Some of these particulars for a few differently sized vessels, will be found in the accompanying table:

Ship's tonnage.	Anchors.				Stud-chain cables.		
	No. of bowers.	No. of others.	Weight of each bower.*	Admiralty test.	Size (minimum).	Length.	Admiralty test.

\* Excluding stock.

**ANCHORAGE** is a due or toll levied on the owner or captain of a ship for permission to cast anchor at special anchoring-grounds. In most instances, it is payable to the state; but sometimes the right is vested in corporate bodies or in individuals. The tariff varies greatly, depending on the size of the ship, or on the value of the cargo, according to circumstances. In most cases, where a vessel is driven into port by stress of weather, and does not discharge cargo there, it is exempt from this toll. Shore-dues differ from A. chiefly in the fact that a vessel pays duty on entering a certain port or harbor, whether she anchors or not; and, by a singular anomaly, these duties are in certain instances vested in the corporation of an inland t., many miles distant from the port in question.

A. is a term also sometimes applied to the whole suite of anchors belonging to a ship; and still more frequently it has the same sense as anchor-ground (q. v.).

**ANCHOR-GROUND** is a part of the bed of the sea, or of a river, suitable for anchoring. It must not be too deep, or the cable will bear too perpendicularly, and will be likely to drag the anchor out of the ground. It must not be too shallow, or the ship's bottom will be exposed to the hazard of striking at low-water, or when the sea is rough. It must not be too rocky, or the anchor will be liable to break its flukes by hooking into jagged rocks, and the cable to be severed by rubbing against rocky edges. Thus, a combination of favorable circumstances is necessary for the selection of a good anchoring-ground.

**ANCHORITES**, or **ANCHORETS** (Gr. *anachorētai*; literally, persons who withdraw from society), the hermits who began to appear in the Christian church in the 3d c., living in solitude, and not, like the monks or cenobites, in communities. During the first two centuries, Christians generally thought it enough to withdraw from the world by refusing to participate in heathen festivals and amusements; but extreme views became gradually prevalent, and were connected with a belief in the merit of celibacy, of abstinence from particular kinds of food, of self-inflicted tortures, etc. The persecutions to which Christians were subjected, drove some into the solitude of deserts; afterwards, the glory of a life spent in loneliness and austerity became a substitute for that of the martyr's death. The general corruption of society also caused many earnest and well-meaning persons to flee from it; the Ascetics (q. v.) first set the example of retiring from cities to rural districts and villages; the A. went further, and sought to withdraw themselves altogether from mankind; and if the reputation of sanctity which was connected with a life of solitude constituted its chief attraction to some, there can be no doubt that many chose it in the hope of thereby attaining to real sanctity. Many of the A. voluntarily subjected themselves to the vicissitudes of the weather, without proper habitation or clothing, restricted themselves to coarse and scanty fare, wore chains and iron rings, and even throughout many years maintained painful postures, such as standing on the top of a pillar (see **STYLITES**), thus displaying an earnestness which greater enlightenment might have directed to the good of mankind. Paul (q. v.) the hermit, and Antony (q. v.), were among the first and most celebrated A. The A. were not always able to preserve their solitude unbroken. The fame of their sanctity drew many to visit them; their advice was often sought; and the number of their visitors was much increased by the belief that diseases, particularly mental diseases, were cured by their blessing. Sometimes, also, they returned for a short time to the midst of their fellow-men to deliver warnings, instructions, or encouragements, and were received as if they had been inspired prophets or angels from heaven. The number of A., however, gradually diminished, and the religious life of convents was preferred to that of the hermitage. The western church, indeed, at no time abounded in A. like the eastern, and perhaps the reason may in part be found in the difference of climate, which renders a manner of life impossible in most parts of Europe that could be pursued for many years in Egypt or Syria.

**ANCHOVY**, *Engraulis encrasicolus*, a small fish, about a span long, much esteemed for its rich and peculiar flavor. It is not much longer than the middle finger, thicker in proportion than the herring, to which it has a general resemblance; the head is sharp-pointed, and the under jaw much shorter than the upper; the scales large, silvery, and easily removed, the tail deeply forked. It is occasionally found on the British coasts, and is said to be not at all uncommon on the coast of Cornwall in the latter part of summer and beginning of autumn. It would seem to have been formerly more abundant than it now is in the British seas, as several acts of parliament, of the reign of William and Mary, regulated the A. fisheries. It occurs on the coasts of the Baltic and of Greenland, and abounds in the Mediterranean and on the Atlantic coasts of Spain, Portugal, and France, where extensive and very productive fisheries are carried on, particularly in the months of May, June, and July, when the shoals of anchovies leave the deep seas, and approach the shores for the purpose of spawning. They are fished during the night, and are attracted to the boats by fires. They are salted in small barrels, and are much used for sauces, etc. The Romans made from them a highly valued sauce called *garum*.—*Sardines* (q.v.) are often sold as anchovies.—The genus *engraulis* belongs to the *clupeidae* (q.v.) or herring family, and was formerly included in *clupea*, from which it is distinguished by the more deeply cleft mouth, the wider gill openings, and more numerous gill rays. All the species are small, and most of them tropical. *E. brownii* abounds in the strait of Malacca and at the mouths of the Ganges, and is used for making a delicious condiment called *red fish* in India.

**ANCHOVY PEAR**, *Grias cauliflora*, a tree, the only known species of a genus somewhat doubtfully referred by Lindley to his order *barringtoniaceae* (more generally regarded as a sub-order of *myrtaceae*, q.v.). It grows in boggy places in the mountainous districts of Jamaica and other West Indian islands, attains a height of 50 ft., and has great oblong leaves 2 or 3 ft. in length. The flowers are numerous, on short peduncles, large and whitish, the corolla consisting of four petals, and the calyx 4-cleft. The fruit is an ovate drupe, crowned with the persistent calyx, the stone marked with eight ridges. This fruit is pickled and eaten like the East Indian mango, which it much resembles in taste.

**ANCHUSA**. See **ALKANET**.

**ANCHYLO'SIS**. See **ANKYLOSIS**.

**ANCIENNE LORETTE**, a Canadian village, 7 m. w.s.w. of Quebec; pop. '71, 2333; the last refuge of the Huron Indians after their defeat at lake Huron in 1650. A remnant of the race still exists in the village.

**ANCIENTS, COUNCIL OF**, one of the two assemblies composing the French legislature in 1795-99. There were 250 members, none less than 40 years old. It was dissolved at the overthrow of the directory by Napoleon.

**ANCIL'LON**, a French family who, after the revocation of the edict of Nantes, migrated from Metz into Prussia.—**DAVID A.** studied theology at Geneva, was afterwards pastor of the French Reformed colony at Hanau, and d. in Berlin in 1692.—**CHARLES**, son of the former, was b. at Metz, July 28, 1659, and d. in Berlin, July 5, 1715. He is known by his writings: *L'Irrévocabilité de l'Édit de Nantes* (1688), and *Histoire de l'Établissement des Français Réfugiés dans les États de Brandebourg* (1690).—**LOUIS FREDERICK**, grandson of Charles A., was b. in Berlin 1740, and d. there as pastor of the French congregation in 1814. His son **FREDERICK**, who rose to be a minister of state in Prussia, was b. in Berlin, April 30, 1767. In 1792, he was appointed professor of history in the military academy of Berlin, and afterwards royal historiographer, a post to which he had recommended himself by his work, *Tableau des Révolutions du Système Politique de l'Europe depuis le 15<sup>me</sup> Siècle* (4 vols., Berlin, 1803-1805). In 1814, he took an administrative post under Hardenberg, and, in 1818, held a very prominent position under Count von Bernstorff. In 1830, when the July revolution occurred in France, he assisted the measures of king Frederick William III. for the preservation of peace in Europe. While, like the politicians of Austria, he argued that "all should be done for the people, but nothing by the people," he also contended for the necessity of progressive reforms in legislation, in order to prevent all violent collisions between government and popular opinion. His private life was simple and unostentatious. Though thrice married, he left no children. A. d. April 19, 1837. His various writings on politics, philosophy, and literature are chiefly devoted to an exposition of the principles by which he was guided as a statesman.

**ANCK'ARSTROEM**, or **ANKARSTRÖM**, **JOHAN JACOB**, the assassin of Gustavus III., of Sweden, executed Apr. 29, 1792. He was the son of an army officer, a page in the court, and ensign in the royal body-guard. As a partisan of the old aristocrats, he was implicated in seditious movements in 1790, tried, and acquitted. The same year he joined the conspiracy of nobles, and to him fell the lot to kill the king, whom he shot at a masked ball, Mar. 15, 1792. He met his fate firmly, refusing to disclose the names of his accomplices.

**ANCONA**, the capital of a province in Italy of the same name, lat. 43° 38' n., and long. 13° 35' e. It is situated on a promontory of the Adriatic coast, and, rising in the U. K. I.—28

form of an amphitheater, presents a picturesque appearance from the sea. It is the seat of a bishop, and contains (1872) 35,110 inhabitants, of whom above 5000 are Jews. The harbor, once famous, seems likely to be filled up with mud. The commerce is much less considerable than it once was, though, in that respect, it is still one of the most important places on the Adriatic. Corn, and woolen and silk goods, oils, cordage, bacon, fruits, etc., are the chief exports. Value of imports (1874), £963,698; of exports, £436,933. A mole of 2000 ft. in length, built by the emperor Trajan, and a triumphal arch of the same emperor, are the most notable monuments of antiquity. There are some fine public buildings. One of the most venerable of these is the cathedral of St. Cyriac, built in the 10th c., and possessing the oldest *cupula* in Italy. But the houses are in general mean, and the streets narrow. A. is supposed to have been founded by Syracusans who had fled from the tyranny of Dionysius the elder. It was destroyed by the Goths, rebuilt by Narses, and again destroyed by the Saracens in the 10th century. It afterwards became a republic; but in 1532, pope Clement VII. annexed it to the states of the church. In 1798, it was taken by the French; but in 1799, gen. Meunier was obliged to surrender it to the Russians and Austrians, after a long and gallant defense. Since 1815, the citadel has been the only fortification. When the Austrian troops in 1831 occupied the Roman frontiers, whose inhabitants were then in a state of insurrection, the French ministry determined to neutralize the influence of Austria. A French squadron appeared before the harbor, and landed 1500 men, who took possession of the town on the 22d Feb., 1832, without any resistance, the citadel capitulating on the 25th. It remained in their hands till 1838, when both French and Austrians retired from the Papal states. In 1849, a revolutionary garrison in A. capitulated after enduring a siege by the Austrians of 25 days.

**ANCRE**, CONCINO CONCINI, BARON DE LUSSIGNY, Marshal d', a Florentine by birth, who came to the French court in the year 1600, with Maria de' Medici, the wife of Henry IV., and along with his wife, Eleonora Galigai, exercised an unhappy influence in promoting the disagreement between the king and queen. When, after Henry's death, the queen became regent, Concini, as her favorite, obtained possession of the reins of government; and in 1613, was made a marshal and prime minister. He purchased the marquise of Ancre in Picardy, and took his title from it. He became an object of detestation equally to the nobility and the people. A conspiracy was formed against him, to which the young king Louis XIII. was himself privy—Luyne (q.v.) the king's worthless favorite, being one of the conspirators—and he was assassinated in the Louvre in open day, on the 24th of April, 1617. His body was privately buried, but was soon disinterred by the populace, dragged through Paris, and burned before the statue of Henry IV. His wife was soon afterwards accused of witchcraft, which she sarcastically repudiated, saying that the only sorcery she had employed to influence the queen was "the power of a strong mind over a weak one." The sneer, however, did not save her. She was executed, and her son, deprived of rank and property, was driven from the country.

**ANCUS MARCIUS**, son of Pompilia, daughter of king Numa Pompilius, was the fourth king of Rome. Following the example of his grandsire, Numa, he endeavored to restore the almost forgotten worship of the gods and the cultivation of the arts of peace among the Romans. But, despite his inclination for peace, he was engaged in several wars with the neighboring Latin tribes, whom he subdued and reduced to order. These Latins, Niebuhr considers to have formed the original *plebs*. Against the Etruscans he fortified the Janiculum, connected it with Rome by a wooden bridge, and gained possession of both banks of the Tiber, as far as its mouth, where he founded Ostia as the port of Rome; he dug what was called "the ditch of the Quirites"—a defense for the open space between the Cælian hill and Mt. Palatine; and built the first Roman prison of which we read, a proof that civilization had really commenced, inasmuch as offenses then formally ceased to be regarded as private and personal matters, and were treated as crimes against the community. He d. in 614 B.C., after reigning twenty-four years.

**ANCYRA**. See **ANGORA**.

**AN'DA**, a genus of plants of the natural order *euphorbiaceæ*, the only species of which *A. brasiliensis*, is a Brazilian tree, with large yellow flowers, and an angular fruit about the size of an orange, containing two roundish seeds, like small chestnuts. The seeds are called in Brazil *purga dos paulistas*, are much used medicinally in that country, and are more purgative than those of the castor-oil plant. This quality seems to depend upon a valuable fixed oil, of which twenty drops are a moderate dose. It is obtained by pressure. The bark of the tree, roasted in the fire, is accounted in Brazil a certain remedy for diarrhea, brought on by cold. The fresh bark, thrown into ponds, is said to stupefy fish.

**ANDALU'SIA**, or **ANDALUCIA**, a large and fertile province or kingdom in the south of Spain, lying between 36° 2' and 38° 39' n. lat., and 1° 38' and 7° 20' w. lon. Having been overrun by the Vandals, it is supposed by some that they gave it the name of Vandalucia or Andalucia; but the real origin of the name is probably *Andalus*, the land of the west. It is the *Tarshish* of the Bible, and was called *Tartessus* in

ancient geography. The Romans named it Bætica, from the river Bætis (the modern Guadalquivir). The Moors founded here a splendid monarchy, which quickly attained a high degree of civilization. Learning, art, and chivalry flourished in harmony with industry and commerce. The four great Moorish capitals were Seville, Cordova, Jaén, and Granada. During the darkness of the middle ages, Cordova was "the Athens of the west, the seat of arts and sciences;" and later still, under the Spaniards, when "the sun of Raphael set in Italy, painting here arose in a new form in the Velasques, Murillo, and Cano school of Seville, the finest in the peninsula." On the n., A. is divided from Estremadura and New Castile by the mountain-chains of Aroche, Cordova, and Morena. On the e. it is bounded by Murcia, and on the w. by Portugal and the Atlantic. The s. coast eastward from Gibraltar is mountainous; the w., where the Guadalquivir flows into the Atlantic, is level. A. was esteemed the richest district of Hesperia, and its former wealth of produce has been indicated by such names as the "garden," the "granary," the "wine-cellar," and the "gold-purse" of Spain. But, in the present day, such predicates are merited only by comparatively small portions of the hilly country on both sides of the Guadalquivir, where, even with careless cultivation, the soil is luxuriantly productive. Here wheat and maize ripen in April, and yield abundantly. Olives and oranges attain their greatest height, and vegetation generally assumes a tropical character. Cotton, sugar-cane, Indian figs, and batatas flourish in the open air, and the cactus and aloe form impenetrable hedges. Wine and oil abound. The botany and mineralogy of A. are very rich. The ranges of the Sierra Nevada are composed principally of primary and secondary formations. In the w., towards Xenil, cultivation is more sparing, as there is a natural deficiency of water, and the artificial means of irrigation formerly employed have fallen into disuse. Nearer to the coast lie tracts of land still more barren; and the level strip extending between the mouths of the Guadalquivir and the Tinto is covered with moving sands. On the whole, A. is still one of the most fertile districts of Spain, owing to its delicious southern climate and the abundance of water supplied by its snowy mountains. Its breed of horses has long been celebrated, and the mules are superior to those of other countries. The Sierra Morena mountains supply the wild cattle exhibited in the bull-fights of Madrid. The natural riches of the district have at various times invited colonists and invaders, such as the Phœnicians and the Moors. The Andalusians are regarded as among the most lively, imaginative, and active people of Spain. But they are also considered by the rest of their countrymen to be the Gascons—the braggarts and boasters of Spain. Apparently they have never at any time been warlike, since even Livy calls them *imbelles*. They are, like all braggarts, extremely credulous, and are, besides, remarkable for their intense superstition. The worship of the Virgin prevails to such an extent that the very country is called "the land of the most holy Virgin." They speak a dialect of Spanish mixed with Arabic. A. is divided into the provinces of Almeria, Jaén, Malaga, Cadiz, Huelva, Seville, Cordova, and Granada. The chief towns are Seville, Cordova, Jaén, Cadiz (q. v.). Area, 33,840 sq. m. Pop. '70, 3,264,640.

**ANDALUSITE**, an anhydrous silicate of alumina, occurring in four-sided prisms, distinguished from feldspar by being harder and less fusible. A variety called chiastolite is found in abundance at South Lancaster, Mass.

**ANDAMANS**, a group of thickly-wooded islands towards the e. side of the bay of Bengal, between 10° and 14° of n. lat., and about 93° of e. long. The population is both barbarous and scanty, and bears no resemblance whatever either in physical features or language to the neighboring Asiatic races. In 1793 the Great Andaman received a British colony, which was withdrawn, however, in 1796. Since 1857, the A. have been a penal settlement for sepoys, mutineers and other criminals. In 1872, lord Mayo, governor-general of India, was assassinated here by one of the convicts. It is physically, however, that the A. deserve mention, not for anything in themselves, but from their being a portion of the long arch, mostly volcanic, of the Indian archipelago, which, with Timor at its bend, comprises the Moluccas, Celebes, the Philippines, and Formosa, on the one side; and on the other side the Sunda isles, Java, Sumatra, the Nicobars, and the A.—the outline only requiring to be filled up in imagination, in order to produce a peninsula harmonizing more or less with the other southern projections of the world, Hindostan, Africa, and South America.

**ANDANTE** (Italian), in music, implies a movement somewhat slow and sedate, but in a gentle and soothing style. This term is often modified, both as to time and style, by the addition of other words—as *A. affettuoso*, slow, but pathetically; *A. cantabile*, slow, but in a singing style; *A. con moto*, slow, but with emotion; *A. grazioso*, slow, but gracefully; *A. maestoso*, slow, with majesty; *A. non troppo*, slow, but not too much so; *A. pastorale*, slow, and with pastoral simplicity.

**ANDELYS, LES**, a t. in the department of Eure, France, 20 m. n.e. of Evreux. It consists of Grand and Petit A. The former dates from the 6th c., and has a collegiate church with wonderful stained-glass windows. Petit A. clusters around château Gailard, built by Richard Cœur de Lion in 1195, and once one of the strongholds of France. The chief trade is in cloth. There are thread and leather manufactures. Pop. '72, 5379.

**ANDENNES**, a t. of Belgium, in the province of Namur, 10 m. e. from Namur, and nearly 2 m. s. from the Maas. It has manufactures of paper, porcelain, and tobacco-pipes, for the last of which it is particularly famous. Cotton-spinning, bleaching, and other branches of industry are also prosecuted. There are beds of pipe-clay, quarries of marble, and lead, iron, and coal mines in the neighborhood, Pop. (1870) about 6700.

**ANDERAB'**, or **INDERAB**, a t. in the Afghan portion of Turkestan, on the northern slope of the Hindu Kush mountains, and on the right or northern bank of the Anderab or Inderab river, a branch of the Ghorî or Kunduz, itself a branch of the Jihun, 80 m. s.s.e. from Kunduz. It is surrounded by gardens, orchards, and vineyards. It is a principal *entrepôt* of commerce between Persia and India. Pop. supposed to be about 6500.

**ANDERLECHT**, a t. in Belgium, a suburb of Brussels; pop. '66, 11,663. Here, Nov. 13, 1792, Dumouriez defeated the Austrians.

**ANDERLO'NI, FAUSTINO**, 1766-1847; an engraver of Padua. Among his works are a portrait of Herder, a Magdalen after Correggio, and a Holy Family, after Poussin.

**ANDERLO'NI, PIETRO**, 1784-1849; brother of Faustino; an Italian engraver, pupil of his father, and director of the Loughi school in Milan. His best pieces are "The Woman taken in Adultery," after Titian; "The Virgin," after Raphael; "Moses and Jethro's Daughter," after Poussin, and portraits of Da Vinci, Canova, and Peter the Great.

**ANDERNACH**, a little t. belonging to the district of Coblenz on the Rhine, in lat. 50° 27' n., long. 7° 25' e., was once a Roman fortress styled Antunnacum, then a residence of the Merovingian kings, and afterwards became one of the most flourishing places on the Rhine. The great tower on the n. side, the fine old church—with one tower built in the Carolingian times—and the old gates and walls, give quite a medieval aspect to the town. It now contains about 4500 people, supported by trade in leather, wine, and corn, and is especially celebrated for its millstones, exported to distant parts of the world, and for its *tuffstein* or trass, an indurated volcanic mud, which, when pulverized and mixed with lime, makes a mortar or cement for constructions under water.

**ANDERSEN, HANS CHRISTIAN**, one of the most gifted poets that Denmark has recently produced, was b. April 2, 1805, at Odense in Funen. His father was a poor shoemaker, who used, however, to console himself by speaking of the former prosperity and wealth of his family. After his father's death, he was for a short time employed in a manufactory. The widow of Bunkefiød, a poet of some reputation, charitably adopted him. He early displayed a talent for poetry, and was known in his native place as "the comedy-writer." Hoping to obtain an engagement in the theater, he went to Copenhagen, but was rejected because he was too lean. He was next encouraged to hope for success as a singer; but had hardly commenced his musical studies when his voice failed. He found generous friends, however, to help him in his distress; and application having been made by one of them to the king, he was placed at an advanced school at the public expense, and so began his academic education in 1828. Some of his poems, particularly one entitled *The Dying Child*, had already been favorably received, and he now became better known by the publication of his *Walk to Amak*, a literary satire in the form of a humorous narrative. In 1830, he published the first collected volume of his *Poems*, and in 1831 a second, under the title of *Fantasies and Sketches*. His *Traveling Sketches* were the fruit of a tour in the north of Germany. He completed his *Agnes and the Merman* in Switzerland; and one of his best works, *The Improvisatore*, a series of scenes depicted in a glowing style, and full of poetic interest, was the fruit of a visit to Italy. Soon afterwards, he produced *O. T.* (1835), a novel containing vivid pictures of northern scenery and manners, which was followed (1837) by another, entitled *Only a Fiddler*. In 1840, he produced a romantic drama, entitled *The Mulatto*, which was well received; but another drama, *Raphaella*, was less successful. In the same year appeared his *Picture-book without Pictures*, a series of the finest imaginative sketches. In the end of 1840, he commenced a somewhat lengthened tour in Italy and the east, of which he gave an account in *A Poet's Bazaar* (1842). In 1844, A. visited the court of Denmark by special invitation, and in the following year he received an annuity. After that date he traveled much, visiting England as well as other countries. Among other works of A. are *Tales from Jutland* (1859); *The Sandhills of Jutland* (1860); *Tales for Children* (1861); *The Wild Swans*, and *The Ice Maiden* (1863); *The Story of my Life*; *Ahasuerus*, a drama; and *New Tales and Adventures* (1872). His works have been translated into German, English, etc. His *Dying Child* has been translated into the language of Greenland; and on his 70th birthday he was presented with a book containing one of his tales in 15 languages. On the same occasion the king of Denmark gave him the grand cross of the Dannebrog order. A. died in Aug., 1875. He is best known in Britain by his beautiful fairy tales.

**ANDERSON**, a co. in s.e. Kansas; 576 sq.m.; pop. '75, 5809. The productions are agricultural. Co. seat, Garrett.

**ANDERSON**, a co. in n. central Kentucky, on the Kentucky river, intersected by Salt river; 300 sq.m.; pop. '70, 5449—698 colored; surface undulating; produces wheat, corn, tobacco, wool, and butter. Co. seat, Lawrenceburgh.

ANDERSON, a co. in South Carolina, on Savannah river; 800 sq.m.; pop. '80, 33, 613—14,847 colored. Two railroads pass through it. The surface is uneven; soil fertile and well cultivated to wheat, corn, cotton, etc. Co. seat, Anderson.

ANDERSON, a co. in n.e. Tennessee, on the Clinch and Powell rivers; 600 sq.m.; pop. '70, 8704—928 colored. There are coal veins, and salt and sulphur springs; products, wheat, corn, and oats. Co. seat, Clinton.

ANDERSON, a co. in central Texas, on Trinity river; 900 sq.m.; pop. '70, 9229—4436 colored. It is heavily timbered, and has a rolling surface and fertile soil, producing corn, cotton, and sweet potatoes. Co. seat, Palestine.

ANDERSON, a city in Madison co., Indiana, on a fork of White river, reached by two railroads. It is a manufacturing place, having a hydraulic canal with a fall of 44 ft. Pop. '70, 8126; of the township, 4713.

ANDERSON, ALEXANDER, 1775-1870; the first American wood engraver, son of a Scotch printer of a patriotic paper in New York, *The Constitutional Gazette*. At the age of 12, A. made attempts at engraving on type metal and copper plates. Then he studied medicine, and took the degree of M.D. in Columbia college in 1796; but he returned to art studies, his first regular employment being in illustrating a small book called the *Looking Glass for the Mind*. He invented his own tools, and followed Bewick of England in using wood blocks for engraving, in which he attained great perfection. He illustrated the first edition of Webster's *Spelling Book*, and for many years the American tract society's publications, working with great skill and fervor up to the year in which he died.

ANDERSON, Sir EDMUND, 1540-1605; an English judge, chief justice of common pleas in 1582, distinguished for zeal in the cause of the established church and for harshness toward dissenters. He was one of the commissioners in 1586 to try queen Mary of Scotland, and afterwards to try Sir Walter Raleigh. His reports of cases in his time in the common pleas and the courts of Westminster are very valuable.

ANDERSON, JAMES, 1662-1728; a Scotch lawyer and antiquary, of high reputation as a historian. He was employed by the Scotch parliament to prepare for publication what remained of the public records of the kingdom; on this work he labored many years, but he did not finish it, though it was published after his death. After the union he was appointed postmaster-general of Scotland, 1715, but lost the place two years later, and did not secure any adequate reward for his immense literary labor. His *Royal Genealogies from Adam to These Times* appeared after his death.

ANDERSON, JAMES, LL.D., a writer on political economy and agriculture, was b. in 1739 at the village of Hermiston, near Edinburgh. He lost both his parents when very young, so that the management of a large farm, which had been in the possession of the family for a long time, devolved upon himself. Recognizing the practical importance of a knowledge of chemistry to a farmer, he attended the chemistry class in the university of Edinburgh, and brought the results of his study to bear on his profession. He invented, at an early period of life, the small two-horse plough without wheels commonly called the Scotch plough, which is generally admitted to have been one of the most useful improvements of agricultural implements ever introduced. When only 24 years of age, he went to Aberdeenshire, where he rented a large moorland farm of 1800 acres. Here he remained for a considerable time, devoting his leisure hours to writing upon agriculture. His first attempt was a series of essays upon planting, which, under the signature of *Agricola*, he contributed to the *Edinburgh Weekly Magazine*. In 1780, the university of Aberdeen bestowed on him the degree of doctor of laws. In 1784, on account of his pamphlet, entitled *Encouragement of the National Fisheries*, he was engaged by government to make a survey of the western coast of Scotland, with special reference to that object. He next commenced in 1791 the publication of a periodical called *The Bee*, which was continued for three years; in 1797 he went to London, where he pursued his literary avocations with such intense assiduity, that his health gradually gave way. He died on the 15th of Oct., 1808.

A. will deserve a place in any record which details the remarkable advances made by Scotland in agriculture and other sources of wealth in the latter half of the 18th century. And even in the history of ideas he will deserve a prominent notice, as his *Bee* was the type of many periodical miscellanies of a cheap nature, mingling instruction with entertainment, which have since been published. It is also to be observed that, in his essay called *A Comparative View of the Effects of Rent and of Tithe in Influencing the Price of Corn* (contained in one of his latest publications, *The Recreations of Agriculture*), he anticipated some important principles subsequently advocated by Malthus, Ricardo, and West, particularly the famous theory of rent.

ANDERSON, JOHN, F.R.S., professor of natural philosophy in the university of Glasgow, and founder of the eminently useful institution bearing his name, was b. in the parish of Roseneath, Dumbartonshire, in 1726. He studied at the university of Glasgow, in which, in his 30th year, he was appointed professor of oriental languages. Four years later (1760), he was transferred to the chair of natural philosophy. He entered upon his new duties with extraordinary ardor. Besides the work of the class, he was indefatigable in studying the application of science to mechanical practice.

Inspired by a rational philanthropy, he instituted, in addition to his usual class, which was strictly mathematical, one for artisans. He continued to teach this *antitoga class*, as he called it, twice every week, during the session, to the end of his life. In 1786 appeared his valuable work, entitled *Institutes of Physics*, which went through five editions in ten years. Shortly before the French revolution, he invented a species of gun, the recoil of which was stopped by the condensation of common air within the body of the carriage; but having in vain endeavored to attract the attention of the British government to it, he proceeded to Paris in 1791, and, being himself a great friend of liberty, presented his model to the national convention. It was hung up in their hall, with the following inscription over it: "The gift of SCIENCE to LIBERTY." Afterwards, when the allied monarchical forces had drawn a military cordon around the frontiers of France, to prevent the introduction of French newspapers into Germany, A. ingeniously suggested the expedient, which was adopted and proved quite successful, of making small balloons of paper, to which newspapers and manifestoes might be tied, and letting them off, when the wind was favorable, for Germany. A. died 13th Jan., 1796. By his will, dated 7th May, 1795, he directed that the whole of his effects, of every kind, should be devoted to the establishment of an educational institution in Glasgow, to be denominated *Anderson's University*, for the use of the academical classes.

ANDERSON'S, or more commonly, the ANDERSONIAN UNIVERSITY, was originally intended to consist of four colleges. The will of the founder places the institution under the immediate superintendence of 81 trustees, the mode of whose selection is prescribed, and these trustees elect annually nine of their number as managers. The funds being inadequate to the proposed plan, the institution was opened with only a single course of lectures on natural philosophy and chemistry by Dr. Thomas Garnett in 1796. This course was attended by nearly 1000 persons of both sexes. In 1798, a professor of mathematics and geography was appointed. In 1799, Dr. Birkbeck, the successor of Dr. Garnett, commenced the system of giving a familiar exposition of mechanics and general science, and this was the origin of mechanics' institutes.

The institution has gradually enlarged its sphere of instruction, and brought it nearer to the design of the founder. In 1879, the number of professors amounted to 14, besides which there were 7 teachers and lecturers. Courses of instruction are given in physical and medical science and in chemistry; there are also taught mathematics, Latin, Greek, Hebrew, French, etc. As a school of medicine, in particular, it possesses a high reputation.

In 1861, John Freeland, esq., residing at Nice, mortified the sum of £7500 for promoting the permanent establishment, in Anderson's university, of popular lectures on chemistry, mechanical and experimental physics, and anatomy and physiology. In addition to the above, Mr. Freeland, in 1871, made a gift, for the general purposes of the university, of £5000. In 1866, William Ewing, insurance broker in Glasgow, settled in trust the sum of £3000 for the establishment of popular lectures on music in the university. In 1870, James Young, esq., of Kelly, settled in trust the sum of £10,500 for the purpose of establishing a chair of technical chemistry; and recently the managers have obtained other funds whereby they have been enabled to institute a chair of "applied mechanics." In connection with the last two chairs, there are a number of valuable bursaries, the gift of gentlemen connected with the city, and others interested in extending scientific instruction.

ANDERSON, MARTIN BREWER, LL.D., b. Maine, 1815; a graduate of Waterville college; tutor of Latin, and in 1843 became professor of rhetoric in the same institution. He resigned in 1850 and became editor of the New York *Recorder*, a Baptist paper. In 1853 he was called to preside over the new Rochester university, and in 1868 was offered (but declined) the presidency of Brown university. He is a vigorous and popular preacher, though he has never been ordained to the ministry.

ANDERSON, ROBERT, b. Ky., 1805; d. France, 1871; brigadier-general in the U. S. army. He graduated at West Point in 1825; served in the Black Hawk war of 1832, and in the Florida war, and, May, 1838, became assistant adjutant-general on gen. Scott's staff. He was in the Mexican war, and was wounded at Molino del Rey. In 1857 he was made major of the 1st artillery. In Nov., 1860, he took command in Charleston harbor, and was for fifteen weeks shut up in fort Sumter by the rebels. On the 14th of April, after a bombardment of 36 hours, being short of provisions, though the fort was still tenable, he marched out with the honors of war, losing none of his men, and went to New York. He was appointed brigadier-general in May, 1861, and sent to command the department of the Cumberland, but his health failed, and with brevet of major-general in the regular army he retired from the service. He translated and adapted several works on artillery practice.

ANDERSON, RUFUS, D.D., LL.D.; b. Maine, 1796; graduate of Bowdoin, 1818, and studied theology at Andover. He was secretary of the American board of foreign missions for 34 years. Resigning at the age of 70, he received a gift of \$20,000 from New York and Boston subscribers, all of which he gave to the American board, reserving only the right to draw for his actual needs. He is the author of *Observations on the Peloponneseus and the Greek Islands*, and various books concerning missions and the work of the American board.

ANDERSONVILLE, in Sumter co., Ga., the location of a military prison of the "confederate states." The prison site was a pine and oak grove of 22 acres, on the side of a hill of red clay, 1600 ft. e. of the railroad. The first prisoners arrived Feb. 15, 1864, and the last in April, 1865; total received, 49,485; died, 12,926; of which 8952 died from diarrhoea; 3574 from scurvy; 1648 from dysentery. The prison was notorious for unhealthfulness and its discipline for barbarity; and in 1865, after the close of the war, Henry Wirz, a Swiss, the chief instrument of ill treatment, was indicted for "injuring the health and destroying the lives of prisoners by subjecting them to torture and great suffering, by confinement in unhealthy and unwholesome quarters, by exposing them to the inclemency of the winter and the dews and burning sun of the summer, by compelling the use of impure water, and by furnishing insufficient and unwholesome food; for establishing the dead line and ordering the guards to shoot down any prisoner attempting to cross it; for keeping and using bloodhounds to hunt down prisoners attempting to escape; and for torturing prisoners and confining them in stocks." He was found guilty and hanged. Under orders of the government, the place where the bodies had been rudely buried in long trenches was arranged as a cemetery, and adorned with gravel walks and trees; 12,461 dead soldiers of the union army were identified, and their places of burial marked with tablets; 451 were "unknown."

ANDERSSSEN, ADOLPH, b. 1818; a German chess player. He was a teacher of mathematics in Berlin. In 1851, he defeated Staunton and other British players at the London tournament; but was beaten in Paris, 1858, by Paul Morphy. He received the first prize in London in 1862. He is an author of papers and books on the game.

ANDERSSON, CARL JOHAN, 1827-67; natural son of an English sportsman residing in Sweden. In 1849, he joined Francis Galton in a journey in South-west Africa, continued alone through 1853-54, and on his return to England published *Lake Ngami, or Explorations and Discoveries during Four Years' Wanderings in the Wilds of South-western Africa*. He made a journey to lake Ngami in 1858 with Green, the elephant hunter, and found his way to the red tribes of Herrevo land. On his return he published a book on the Okovango river. In May, 1866, he went on an exploration to the Cunene for the purpose of establishing commercial intercourse with the Portuguese settlements n. of that river. He came in sight of the stream, but was too feeble to cross it, and died in trying to return to Cape Town.

ANDES, the great mountain chain of South America, extending in a direction nearly parallel with the Pacific, along almost the whole length of the continent. The chain falls short of the isthmus of Darien, between which and the Atrato—a river falling into the Caribbean sea—it gradually subsides into a merely undulating country. It appears, also, to fall still further short of the strait of Magellan, so far as the mainland is concerned. But, on geological grounds, it has been traced, first along the islands that breast Patagonia to the w., and next along those that form the Fuegian archipelago. Thus may the chain be said to stretch from the neighborhood of the mouth of the Atrato, not merely to cape Horn, but even to the rocks of Diego Ramirez, which lie about 60 m. to the s.w. of that promontory. The extreme length, therefore, is from lat. 8° 15' n. to lat. 56° 30' s.—comprising, of course, 64° 45', or, without any allowance for windings or deviations, about 4500 English miles. But to mark the scale on which nature has molded the new world, the A. may be regarded as merely a part of the sufficiently continuous chain of about 9000 m. which loses itself near the mouth of the Mackenzie, towards the shores of the Arctic ocean. In this respect, the old continent can bring nothing into comparison.

*Position.*—The A., besides being generally in a direction nearly parallel with the Pacific, verge closely on that ocean. From the rocks, indeed of Diego Ramirez to about lat. 40° s., the mountains, whether they are found on islands or on the mainland, are almost literally washed by the surf; while northward from that parallel, there spreads out, between the chain itself and the sea, a belt of land not exceeding, in average breadth, 70 or 80 miles. Within the limits of Peru, the belt in question is narrowest, while above and below it is, in general, somewhat more extensive. The position of the A. with respect to the Atlantic ocean presents a striking contrast. To illustrate this, a passage is subjoined from Herndon, the explorer of the Amazon in behalf of the United States. Crossing from Lima to the head-waters of the Amazon, by the pass of Antarangra, he writes thus: "Yanacoto, on the western slope of the A., at the height of 2337 ft. above the sea-level, is only 28 m. from the ocean that washes the base of the slope on which it is situated; while fort San Ramon, at nearly the same elevation on the opposite side, cannot be much less than 4000 m. from its ocean by the windings of the river, and in the river's direct course is at least 2500 miles." Further to compare the two areas respectively to the w. and e. of the dividing ridge, the former has been estimated at 180,000 sq.m., and the latter at twenty times as much.

*Hydrography.*—This interesting feature of the A. has been already anticipated to a considerable extent, under the heads of the AMAZON and AMERICA. It only remains to observe that from one end of the continent to the other, the true and only water-shed, wherever there are two ranges, is the range nearer to the Pacific. Not only is the water-shed in question obviously far closer to the w. than to the e., but, beyond this, it is, apparently without a single exception, pushed as far to the westward as possible; it

thus affords the most conspicuous and most decisive example of an almost universal law in the hydrography of the earth. Throughout both continents, almost every leading water-shed presents a longer descent towards the e. than towards the w., or, in other words, sends off larger streams in the former direction than in the latter. To cite a few instances: compare, in North America, the Missouri with the Columbia; in Europe, the Volga with the Neva; in Asia, the Hoang-ho of China with the Oxus of the sea of Aral; and even in Africa, where, as also in Arabia, hydrographical traces have been largely overlaid by deserts of sand, the plateau of the Sahara and the chain of the Atlas gradually incline, both of them, towards the e. But, if the water-shed be invariably found as far as possible to the westward, it necessarily follows, that, wherever there are two ranges, the more easterly range cannot also be a continuous water-shed—unless, indeed, it may be regarded as such with respect to the landlocked basin of the connected lakes, Titicaca and Uroz, already mentioned under the head of AMERICA. With this exception, all the gatherings between the two ranges, whether the intermediate space be plateau or sierra, have found or formed channels of escape—narrow, deep, and dark as they often are—only to that sea which is 30 or 40 times more distant than the one at their back.

*Breadth and Area.*—The area, on an estimate, necessarily rough and vague, has been computed to be triple that of the belt of comparatively level land that borders on the Pacific. In other words, the average breadth of the chain is reckoned to be thrice that of the belt in question. In a rough way, the breadth may be estimated from the very shore of the Pacific, whence the w. slope commences, to the lowest *pongos*, or cataracts, on the eastward streams. But it is more correct to measure it from the foot of the mountains, properly so called, on the one side to that on the other. The phraseology of the country, which, on such a subject, ought to be conclusive, appears to support the latter mode of computation. In Lima and its neighborhood, where Herndon crossed the A., that officer speaks of “coast” and “sierra,” as distinguished from each other even to the westward of the dividing ridge. The entire distance of the pass of Antarangra, as measured on the actual road, was 87 m.—the first 50 being *coast* and the remaining 37 being *sierra*. Nor does the distinction seem to have been an arbitrary one. From Callao to Cochachera—a line of 44 m.—the rise above the sea-level, tolerably uniform the whole way, amounted to 4453 ft., or rather more than 101 ft. to the mile; but the next 15 m., of which about a half still belonged to what was called *coast*, yielded an increase of 2850 ft., an average probably of 200 ft. for that part of the stage that fell under the definition of *sierra*. To give instances of extreme breadths of the A.—an average breadth being unattainable—the least breadth, and that in Patagonia, is believed to be 60 or 70 m.; the greatest breadth, again, pretty nearly on the parallel of lake Titicaca, and right through the grand plateau of Bolivia, is said to be 400 m.; and to give an intermediate case, the breadth from Mendoza, in the basin of La Plata, to Santiago, in Chili, is given at 140 m.—the former city being 4486 ft. above the Atlantic, and the latter 2614 above the Pacific.

In order, then, to have a definite idea of the breadth of the A., the chain must be viewed from one end to the other. In doing this there will be adopted the ordinary nomenclature, referring each division of the A. to the particular country through which it may pass.

*Patagonian Andes.*—Including the A. of the Fuegian archipelago, this part of the chain, extending from lat. 56° s. to lat. 42° s., a distance of more than 960 m., is the narrowest of all, or is, at all events, too irregular to have its breadth accurately estimated. The Patagonian shore, strictly so called, is breasted, very much like the n.w. coast between Fuca's strait and mt. St. Elias, by a number of islands. On these, as already mentioned, the true A. are to be found, or rather, of these the true A. consist—the continent itself affording no footing to the chain till fully 300 m. to the northward of cape Horn. Even after the chain has laid hold of the mainland, it by no means can be said to abandon the islands; so that here, as farther to the n., the chain may be regarded as made up of parallel ranges—the main difference being that the intervening valleys, which, to the n., are basins of fresh-water rivers, here present salt-water channels.

*Chilian Andes*, stretching from lat. 42° s. to lat. 24° s., a distance of nearly 1250 miles. Throughout nearly the whole of this line, the A. consist of only one range, for the parallel ridges, which run along between the great water-shed and the Pacific, cannot claim to be any exception to this remark, inasmuch as their highest points do not exceed an elevation of 2500 ft. above the level of the sea. This part of the chain, however, presents several lateral ranges, if it does not present any parallel ones of importance. These spurs are to be seen on both sides, though of very different magnitudes. To the w. they are akin to the comparatively insignificant parallel ranges just noticed, being, if A. at all, merely A. in miniature. But to the e. the spurs deserve more consideration. They are two in number, the one branching off between the 33d and 31st parallels, and the other between the 28th and 24th. The former, called the Sierra de Cordova, advances like a promontory into the plains of Rio de la Plata, or Pampas, as they are more generally denominated, as far as the 65th meridian; and the latter, called the Sierra de Salta, runs nearly as far to the e., and in a direction nearly parallel.

*Peruvian Andes.*—This part of the chain, stretching from lat. 24° s. to lat. 6° s.—a distance about the same as in the last paragraph—is perhaps the broadest of all the divisions of the A. It certainly contains the largest of the plateaus, the plateau of Bolivia. Between the 20th and 19th parallels, not far from the city of Potosi, the chain separates into two ranges, known as the East and West Cordilleras of Bolivia; and it is the reunion of these ranges, between the 15th and 14th parallels, that incloses the landlocked plateau of Titicaca, containing, as is said, 30,000 sq.m., or an area equal to that of Ireland. Immediately above this table-land, the united ranges in question constitute the mountain-group of Cuzco, which, in point of superficial extent, is stated to be thrice as large as all Switzerland. About a degree further north, the chain again separates as before, reuniting also, as before, between the 11th and 10th parallels, so as to embrace the cities of Guanta and Guancavelica. Hardly have the two ranges reunited, when they mass themselves into the table-land of Pasco, not quite half the size of that of Titicaca. Further to the n., the chain divides, not into two, but into three ranges, which unite again, on the frontiers of Ecuador, in the group of Loxa, about lat. 5° s.

*Andes of Ecuador.*—Immediately beyond the group of Loxa, between 4° and 3° of s. lat., the chain divides into two ranges, which, by again uniting in 2° 27', form the valley of Cuenca; and immediately beyond this is the group of Assuay, with its table-land. Then another plateau of no great extent, and a short stretch of the undivided chain, lead to the vast table-land of Quito, which is said to be subdivided by low hills into five smaller plateaus, two to the east and three to the west. Towards the n. the table-land of Quito is succeeded by the group of Los Pastos, forming the extreme portion of the A. of Ecuador.

*Andes of New Granada.*—Beyond the city of Almaguer, the chain breaks off into two ranges, which never again join each other. The range on the w. side remains undivided, till it disappears near the mouth of the Atrato, a little to the e. of the isthmus of Darien. But the range on the e., after massing itself into the group of Paramo de los Papas, breaks into two branches, which, as distinguished from the range aforesaid on the w., are styled the Central and Eastern Cordilleras of New Granada. These two contain between them the upper waters of the Magdalena, the eastern separating them from the basin of the Orinoco, and the central dividing them from that of the Cauca. Between them also they contain several considerable table-lands, the principal one being that of Santa Fé de Bogota.

*Height.*—Under this head must be treated separately the *plateaus*, the most prominent *mountains*, and the *passes*—the altitudes of the lines of perpetual snow falling more naturally under the head of climate. Here, as in the case of *breadth*, the chain will be followed from south to north.

## HEIGHT OF PLATEAUS.

	Feet.
Table-land of Titicaca.....	12,700
Group of Cuzco.....	8,300
Table-land of Pasco.....	11,000
“ “ Assuay.....	15,520
“ “ Quito.....	9,543
“ “ Bogota.....	8,958

The average height of these six colossal masses above the sea-level is thus 11,000 ft., or considerably more than two English miles.

## HEIGHT OF MOUNTAINS.

	Feet.		Feet.
<i>Argentine Andes</i> —		<i>Bolivian Andes</i> —	
Cape Horn.....	3,000	Cerro de Potosi.....	16,040
Sarmiento.....	6,800	Gualtieri.....	22,000
<i>Patagonian Andes</i> —		Nevado de Chuquibambas.....	21,000
Yanteles.....	8,030	“ Illimani.....	21,150
Corcobado.....	7,510	“ Sorata.....	21,290
Minchinadom.....	8,000	Analache.....	18,500
<i>Chilian Andes</i> —		<i>Andes of Ecuador</i> —	
Antuco.....	13,000	Chimborazo.....	21,420
Aconcagua.....	22,296	Cotopaxi.....	18,887
Descabezado.....	12,102	Antisana.....	19,137
Nevado de Chorolque.....	16,546	Pichincha.....	15,922
<i>Peruvian Andes</i> —		Cayambe.....	19,648
Arequipa.....	20,320	<i>Andes of New Granada</i> —	
		Pic de Tolima.....	18,814

This last-named mountain is said to be the only one in New Granada that rises above the limit of perpetual snow. All the others appear to fall short of that line.

## HEIGHT OF PASSES.

	Feet.		Feet.
<i>Chilian Andes</i> —		<i>Bolivian Andes</i> —	
La Cumbre.....	12,454	Potosi.....	14,320
Portillo.....	14,365	Las Gualillas.....	14,830
<i>Peruvian Andes</i> —		<i>Andes of Ecuador</i> —	
Alto de Jacaibamba.....	15,135	Assuay.....	12,385
Lachagual.....	15,480	<i>Andes of New Granada</i> —	
Antarangra.....	16,199	Quindiu.....	11,500

These passes will bear a comparison with the loftiest pinnacles in Europe. The last and lowest overtops the highest summit of the Pyrenees by 332 feet; while the last but two, that of Antarangra, which Herndon traversed, soars 389 ft. above Mont Blanc, the culminating peak of the Alps.

The passes across the A. present a vast variety of surfaces and levels. They appear to skirt, as often as practicable, the mountain-torrents; and, when that is impracticable, sometimes surmount them by bridges, and sometimes avoid them by means of a path cut along the shoulder of the overhanging height.

With respect to the mountain-torrents, Herndon, after leaving Antarangra behind him, was enabled to avail himself chiefly of this resource. "As far as the traveler," says he, "is concerned, there are not, on the route we have traveled, two ranges of the A.—that is, he is not to ascend and descend one range, and then ascend and descend another. From the time that he crosses at Antarangra, his progress is downward, till he reaches the plain. Really, however, there are two ranges. The streams from the first or western range have broken their way through the second, making deep gorges, at the bottom of which the road generally runs, and leaves the peaks of the second range thousands of ft. above the traveler's head."

In addition to the essential perils of such a course, Herndon encountered, on one occasion, an incidental danger, which he thus describes—the scene being a narrow path on the shoulder of an almost precipitous hill: "Mr. Gibbon was riding ahead. Just as he was about to turn a sharp bend, the head of a bull peered round it on the descent. When the bull came in full view, he stopped; and we could see the heads of other cattle clustering over his quarters, and hear the shouts of the cattle-drivers, far behind, urging on their herd. I happened to be abreast of a slight natural excavation; and, dismounting, I put my shoulder against my mule's flank, and pressed her into this friendly retreat; but I saw no escape for Gibbon. The bull, with lowered crest and savage look, came slowly on, and actually got his head between the perpendicular wall and the neck of Gibbon's mule. But his sagacious beast, pressing her haunches hard against the rock, gathered her feet close under her, and turned as on a pivot. This placed the bull on the outside; and he rushed by at the gallop, followed in single file by the rest of the herd."

In the bridging of the mountain-torrents, a good deal of rude ingenuity is displayed. Sometimes chains are suspended from side to side, and sometimes a rough flooring is laid between projecting beams from either bank, which have previously been fixed as solidly as possible. Nature also has done something in this respect to help man, having thrown two bridges of her own over a fearful chasm at Icononzo. The torrent which they span, falls down a beautiful cataract into a murky crevice—the noisy haunt of nocturnal birds. At a height of 400 ft. above the foaming waters, the two bridges hang in mid-air, both of them, apparently, though in different ways, the work of an earthquake. The upper one is merely a fragment of the original sandstone, which must have resisted the shock that formed the rent; while the lower, probably the most singular arch in the world, consists of three detached rocks, so adjusted as to support each other.

The loftiest pinnacles of the A., when viewed from the table-lands, and, still more, when seen from the crests of the passes, lose, to the eye of the beholder, much of their real altitude. Under such circumstances, not a single mountain presents the actual dimensions of mont Blanc, as overhanging the vale of Chamouni. It is only from a distance—best of all, perhaps, from a good offing in the Pacific—that the A. appear in all their gigantic proportions. Standing thus on their pedestal, the most rugged and colossal in nature, they almost realize to the spectator the highest Pyrenees piled on the highest Alps; while, to enhance the grandeur of the scene, the igneous action, which has heaved the chain into existence, is here and there adding to its stature a pillar of smoke and flame.

The geology of the A. is as yet very little known. It is more than half a century since Humboldt traveled through these mountains, and to him we are even now chiefly indebted for our knowledge regarding them. At that time, geology was in its infancy—its language had not been formed; its classification, at least as it now exists, was unknown, and its facts were mixed with absurd and now long-exploded theories; it could, in fact, scarcely be called a science. It is fortunate that as regards the materials constituting the great mass of the A. range—the igneous rocks which form its backbone, and the metamorphic rocks which form its great bulk—our knowledge was almost as extensive and explicit 50 years ago as it is now, and therefore, in respect to them, Humboldt's observations are as good as if made but yesterday. Not so as regards the more recent sedimentary formations. The value of fossils was not then known, and the vaguest ideas prevailed as to the chronological order of the stratified rocks. Hence

descriptions written at that time are almost valueless to modern science. A few scattered notes may be gleaned from the small number of intelligent travelers who have recently visited these mountains; and to them we are obliged for any of the facts we are able to give regarding the deposits referred to.

The elevation of the A. took place at an epoch anterior to the formation of the Rocky mountains of North America, which are geographically a continuation of them. They are composed, to a very large extent, of stratified metamorphic rocks. It is remarkable that granite occurs in them not as an unstratified plutonic rock, but only intercalated with the other members of the stratified azoic series. The true igneous rock belong either to the trappean or volcanic divisions. The grand ridge is everywhere covered with one or other of the varieties of trap (greenstone, clinkstone, basalt, or porphyry). These are often broken into columns, and appear at a distance like ruined castles, producing a very striking effect.

Bursting through the trap-rocks, there are a number of *volcanoes* covering their summits with more recent igneous rocks. Among the mountains specified above as to altitude, Yanteles, Corcobado, Minchinadom, Antuco, Gualteri, Arequipa, Cotopaxi, Antisana, and Pichincha belong to this class. Fifty-one volcanoes have been described as existing throughout the whole range. The mountains of Ecuador are so extensively and continuously of volcanic origin, that they have been regarded as different safety-valves of one and the same burning vault. It is generally maintained that there is a relation between the height of a volcano and its activity and the frequency of its eruptions. Thus, Stromboli (2957 ft.) has continued in a state of activity since the earliest ages, serving the purpose of a light-house to the navigators of the Tyrrhenian sea; while Cotopaxi (18,887 ft.) and Tunguragua (16,579 ft.) have been active only once in a hundred years. Many of these 51 volcanoes have consequently not yet been observed by Europeans in an active state. In the Quito district there are 10 active and 7 of doubtful activity; in Peru and Bolivia, the numbers are 9 and 3; in Chili, 17 and 5; making in all 36 active and 15 about which there is some uncertainty as to their activity. Another characteristic of these volcanoes, resulting from their gigantic altitude, is that few of them emit streams of lava. Thus Antisana is probably the only one in the Quito range that has ejected lava. The force, however, which is repressed apparently by the immense superincumbent mass which fills the crater, is exhibited in a terrific manner when an eruption does take place. Cotopaxi, for instance, the most regular and beautiful outlet of this the grandest of nature's laboratories, has been known to shoot its fiery torrents 3000 ft. above its snow-bound crater, while its voice is said to have been heard at a distance of 550 miles. On one occasion, a piece of rock, measuring 300 cubic ft., was thrown from its crater to a distance of more than 8 miles.

*Earthquakes* are intimately connected with these volcanic phenomena. No portion of the globe is subject to such frequent and destructive earthquakes as the countries embosomed within the range of the A., and those lying between them and the Pacific. The cities and towns of Bogota, Quito, Riobamba, Callao, Copiapo, Valparaiso, and Concepcion have all at different times been more or less devastated by their agency. During the year 1859, an earthquake buried many of the inhabitants of Quito under the ruins of its churches and public edifices; scarcely a single building of any size having escaped uninjured.

It is to the same subterranean agency that upheaved and still convulses the A. that we are to ascribe those fearful ravines which are almost peculiar to the chain. An apt instance has already been cited in the case of the deep and dismal crevice which has been spanned by the natural bridges of Icononzo. A still better specimen is the valley or den of Chota, which, with a width at top of only 2600 feet, is 4875 feet in perpendicular height. This den might overlap the loftiest hill in Scotland, with St. Peter's at Rome on its summit.

The flanks of the mountains are clothed with crystalline stratified rocks, consisting of innumerable varieties of granites, gneiss, schists, hornblende, chloritic slates, porphyries, etc. These have been greatly disrupted by the underlying igneous rocks, and now occupy a vertical or nearly vertical position. They often run up into bold and rugged peaks on the summits. They alternate with each other in great meridional bands, but without any apparent order in the succession, except that the varieties of schist depend on the crystalline parent rock below; otherwise, no regular sequence can be observed; for miles, only granite and gneiss are found, then schist, quartz, gneiss, etc., interchanging. The variety and quantity of the mineral wealth of these rocks is remarkable; with the exception of lead, most of the metals are obtained in large quantities—see below. The topaz, amethyst, and other gems are abundant.

Lying unconformable with these almost vertical metamorphic rocks, there occur in the valleys and table-lands, and creeping up the base of the mountains, a variety of fossiliferous beds, which require further examination before they can be clearly understood. A better estimate of the nature of these deposits will be arrived at by describing one of the localities where they occur. Take the large plateau on which Bogota is built, which is 8958 ft. above the sea. The deposits filling up this plain have been formed subsequent to the present conformation of the district, though not necessarily at the present altitude: the whole range may have been since elevated. The almost horizontal rocks, from their organic contents, consisting of ammonites, hamites, etc., have been re-

ferred by Edward Forbes to the cretaceous era. The basin consists of many beds of sandstones, limestones, shale, coal, gypsum, and salt. The salt occurs in large quantities, one bed being no less than 100 ft. in thickness, and the coal in sufficient abundance to be wrought. All these rocks have been more or less affected by their proximity to the underlying metamorphic rocks. The molecular action going on below has in many places been continued in them, and has induced a cleavage at right angles to their planes of stratification. The other patches—some of great extent, as the plateau of the Titicaca—cannot yet be referred to any particular geologic epoch. Coal has been found near Huanco, in Peru, at the height of 17,000 ft.; fossiliferous limestones and sandstones have been noticed in Peru at Micupampa and Huancavelica.

*Metals.*—The aboriginal term A. is said to have been derived from the Peruvian *anta*, which signifies metal in general, or rather, perhaps, copper in particular. Within the limits of the empire of the incas, mining-tools, evidently not European, have been dug up in various places; and in one district the ancient Peruvians have left behind them traces of their mining operations at a height of 17,000 ft. Moreover, the term, whatever may have been its meaning, appears to have been, at all events, of Peruvian origin, for it does not seem to have been applied to the great chain of mountains by the aborigines of New Granada, now called the United States of Colombia.

The A. are understood to yield every metal used in the arts.

*Gold* is found in Chili, Peru, and Colombia. In Chili, however, it is so little productive that proverbially a gold-mine is inferior to a silver one, and that, again, to a copper one. In Peru, gold is most abundant between the 9th and 7th parallels; though further s., to the e. of Lima, the mines of Carabaya have been recently wrought to great advantage; and further s. still, to the e. of Titicaca, very rich washings are situated on the river Tipuani. In the Colombian states, gold-mines are generally so inaccessible as not to bear the expense of working them. The washings, again, though perhaps remotely the product of the A., are confined chiefly to the alluvial soils that lie between the chain and either sea.

*Silver* also is found in Chili, Peru, and Colombia. In Chili, the most valuable, almost the only very valuable, mines are wrought on the e. face of the A., not far from the city of Mendoza, already mentioned in connection with the breadth of the chain. In Peru, the most productive mines are those of Pasco and Potosi. In those of Pasco, which have now been open for more than two and a quarter centuries without even approaching to exhaustion, the ore is a mixture of silver and oxide of iron. In the mines, again, of Potosi, whose very name has become a proverb, there are said to be no fewer than 5000 excavations, while, to all appearance, only the upper crust of the inexhaustible deposits has been penetrated. In Colombia, it is with silver as it has been shown to be with gold, the mines of the former metal, as well as of the latter, being so inaccessible as not to bear the expense of working them.

*Mercury* or *quicksilver* is found in Quito, near the village of Azogué, which lies to the n. w. of Cuenca—taking its name, as is said, from this metal; and it is found likewise in Peru, not far from Huancavelica, a t. situated, as already stated, to the n. of the group of Cuzco. The mercury exists chiefly in combination with sulphur, forming what is called cinnabar.

*Platinum* appears to exist only in Colombia; but like the gold-washings of that country, it is found rather in the alluvial soils, that have been flooded down from the chain, than in the chain itself.

*Copper* is found chiefly in Chili, but also in Peru. In the latter country, it is of little account in comparison with silver; but, in the former, it may be styled the staple metal, or even the staple production. The most valuable mines are in the northern and southern provinces; in Coquimbo and Copiapo above, and in the neighborhood of Araucania below.

*Climate.*—The climate of the A. is, at every point, affected by three different considerations—position with respect to the length of the chain, position with respect to its breadth, position with respect to its height.

In connection with the *length* of the chain, the variations of climate, though less peculiar than its variations under either of the other aspects, are not merely a counterpart of similar changes in other parts of the globe. In the new world generally, temperature rises and falls more rapidly in proportion to latitude than in the old; and, again, as within the new world itself, more rapidly in the s. than in the n. In connection, therefore, with the length of the A., the variations of climate may be regarded as the greatest possible—the tropical heat of the equatorial regions passing gradually into something like polar cold, even within a latitude not greater than that of Edinburgh. This may be best illustrated with reference to the limits of perpetual snow. Within the strait of Magellan, in about the latitude of Wales, the limit in question is only about 3500 ft., nearly the precise height of the summit of Snowdon. In lat. 33° s., about the center of Chili, the snow-line, according to Humboldt, is estimated at 12,780 ft.; while, on the nearly corresponding parallel, the Himalayas present on their northern slope a snow-line of 16,620 ft. In the tropical regions of the A., the snow-line seems to range from 16,000 ft. to 18,000. This result, excepting that it does not greatly surpass the height of the snow-line as above on the Himalayas, can scarcely be compared with anything in the old world, whose tropical regions do not present any chain of the requisite altitude for the purpose. The

same cause which regularly lowers the snow-line in proceeding from n. to s., has led, in Patagonia and Terra del Fuego, to the formation of glaciers—a feature of the Alps which is altogether unknown in the central and northern divisions of the A. Glaciers, as the growth of an icicle renders familiar to every one, require alternations of heat and cold, or rather of thaw and frost. Now, these essential conditions do not exist in the lower latitudes of the A., where, generally speaking, every stage or terrace, as already noticed under the head of AMERICA, possesses an almost monotonous temperature. But they do exist in Patagonia and Terra del Fuego; and accordingly, glaciers there abound on the shores of the deep indentations of the coast.

In connection, next, with the *breadth* of the chain, the variations of climate, if not peculiar to the A., have no perfect parallel elsewhere. At every point, excepting, perhaps, towards the extreme s., the chain is almost as much of a water-shed to the clouds as it is to the rivers. Rarefied as the air is at the elevation of the A., no vapor, generally speaking, can cross them—even the existence of snow at the height of several miles being a phenomenon which, *a priori*, was hardly to be expected. This fact is rendered more important by the ordinary directions of the currents of air. The prevailing winds blow against the A., not alongside of them, being generally from the e. between the equator and 30°, and from the w. in latitudes towards the s. Thus, generally speaking, every section of the chain has permanently a windward and a leeward side—the former intercepting nearly all the moisture, and the latter being condemned to comparative drought. Peru, Chili, and Patagonia, one and all, confirm these observations in detail. On the w., Peru, unless in the immediate vicinity of the mountain-streams, is little better than a desert; while, on the e., the Montana, as it is called, is remarkable for its fertility. To the w., on the contrary, Patagonia has its glaciers to show as the result of its rains from that quarter; while, to the e., its five terraces, extending 700 m. to the Atlantic, are almost uniformly arid and sterile. Between Patagonia and Peru, Chili has something in common with both, resembling the former in its southern half, and the latter in its northern. To take the Pacific side alone: in the northern parts, showers are only occasional, sometimes at an interval of three years—the deficiency being partly supplied by frequent dews; while, to the s. of lat. 34°, the rains are sufficiently copious to form considerable rivers.

In connection, lastly, with the *height* of the chain, the variations of climate stand alone in the world, being approached, though at a great interval, only by the corresponding changes in Central America. The Alps, to take a familiar analogy, have, it is true, their gradations of climate. But, situated, in round numbers, on about the 45th parallel, they represent only half of the latitudes between the equator and the pole; while the A. of Quito, before reaching this level, must have seen melting into each other the temperatures of Borneo, India, Persia, Asia Minor, and Italy. Taking the snow-line of the A. of Quito at 18,000 ft., and that of the Alps at 8000, the lower and hotter 10,000 ft. of the former have no counterpart at all on the latter. Now, Herndon found Tarma to lie within this height, precisely at an elevation of 9788 ft.; and he there saw apples, strawberries, almonds, grapes, and maize—a state of things not far behind that at the foot of the Alps. No space remaining for details, one general observation must close this article. In an open locality, the naked eye may embrace half a zone, for, to quote a traveler's words, it may look upwards to the barley-field and the potato-patch, and downwards to the sugar-cane and the pine-apple. Perhaps the most striking instance of this more than telescopic vision is connected with the magnificent fall of Tequendama, the single outlet of the waters of the table-land of Bogota. This fall, 600 ft. high, leaps down from the temperate zone to the torrid, from rich crops of wheat to a few scattered palms.

**ANDIRA**, a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*, having an almost orbicular, one-celled, one-seeded pod.—*A. inermis* (formerly known as *geoffroya inermis*) grows in low savannahs in the West Indies, and is there called *cabbage tree* or *cabbage-bark tree*. It is a tree of considerable height, having pinnate leaves, with 13 to 15 ovato-lanceolate leaflets, and panicles of reddish lilac flowers. Its bark, called *cabbage bark* or *worm bark*, is a powerful anthelmintic; and although it has recently been discarded from the pharmacopœias of Britain, still finds a place in those of other countries, along with *Surinam bark*, the bark of *A. retusa* (formerly *geoffroya surinamensis*), a native of Surinam. Similar properties reside in the bark of several species of the allied genus *geoffroya*. Cabbage bark contains an alkaloid called *jamaïcina*.

**ANDIRON**, or **HANDIRON**, is a term frequently to be met with in inventories of the furniture of old houses; and in some parts of the country is still used for what is more generally known as a fire-dog. Andirons were used for burning wood on an open hearth, and consisted of a horizontal bar raised on short supports, with an upright standard at one end. A pair were used, one standing at each side of the hearth, and the logs of wood rested across the horizontal bars. The upright portions of the A. were of various forms, some of them, in later times, representing a human figure. More generally, the design was architectural, much ornamented with arabesques, and frequently with the monograms of their possessors. The ornamental parts of the A. were sometimes silver, but more often copper.

**ANDKHUY**, a t., formerly of Bokhara, but now of Afghanistan, central Asia, about 200 m. s. of Bokhara, on a river flowing n. towards the Jihum, but only part of which has as yet been traced. It lies on the high-road to Herat, and is much exposed to the attacks of the emirs of Bokhara and Afghanistan. Down to the year 1840, it is said to have been tolerably flourishing. It was then subject to Bokhara, and was compelled to oppose the victorious march of Mohammed Khan, who besieged it during four months, and at last only took it by storm. The city was plundered, and left a heap of ruins. The sovereign, Gazanfer Khan, to preserve himself from utter destruction, threw himself into the arms of the Afghans. A. contained in 1863 about 2000 houses, which form the city, and about 3000 tents, which are either in the environs, or scattered over the oases in the desert. The pop. is estimated at 15,000, consisting principally of Turkomans, with a mixture of Uzbeks and a few Tadjiks.—Vámbéry's *Travels in Central Asia*.

**ANDOCIDES**, 467-391 B.C.; a Greek orator and diplomatist. He held for a time a command in the Athenian fleet, and was employed in various embassies to foreign states. He was implicated with Alcibiades in the charge of mutilating the busts of Hermes; he accused others, who were put to death, but he was deprived of the rights of citizenship and went into exile. Thrice he returned to Athens, and was as often sent out; but from 403 to 393 he held honorable positions there. Three orations by him of great historical value are extant.

**ANDORRA**, a valley in the eastern Pyrenees between the French department of Ariège and Catalonia, in Spain. It is inclosed by mountains, through which its river, the Balira, breaks to join the Segre at Urgel; and its inaccessibility naturally fits it for being the seat of the interesting little republic which here holds a kind of semi-independent position between France and Spain. Area (divided into six parishes) about 300 sq.m.; pop. variously stated at from 4000 to 12,000. The capital is Andorra, on the Balira, with a pop. of 2000. The former abundant forests are becoming thin from use as fuel; there is much excellent pasture; vines and fruit-trees flourish on the lower grounds, and the mountains contain rich iron mines; but agriculture is so neglected, and the quantity of arable land so small, that the inhabitants partly depend for corn upon France. A. was declared a free state by Charlemagne, in reward for services rendered to him by its inhabitants, when he was marching against the Moors. He retained certain rights which Louis le Débonnaire afterwards transferred to the bishop of Urgel, in 819 A.D., and which the bishop of Urgel still exercises. The republic is governed by a sovereign council of twenty-four members, chosen by the people, and the council elects one of its members to be syndic for life, who exercises the chief executive power. There are two judges called *viguier*s, of whom the first is appointed by France, which exercises a kind of protectorate, and the second by the bishop of Urgel. There is also a civil judge appointed by France and the bishop of Urgel alternately. The first *viguier* is a Frenchman, and the second a native of A. Under each *viguier* is an inferior judge called a *baillie*; but there is an appeal from his judgment to the civil judge, and finally to the court of cassation at Paris, or to the Episcopal college at Urgel. In criminal cases, there is no appeal from the court of the republic itself, in which the first *viguier* presides. The revenue of the state is derived from lands, and from some inconsiderable taxes. A sum of 960 francs is paid biennially to France, in return for which is granted the privilege of free importation of corn. A payment of 891 francs is made in the intervening years to the bishop of Urgel. The manner of life of the Andorrans is very simple. There are schools, but education is in a low state. There is a complete military organization. In the Carlist wars the neutrality of A. was strictly respected, though various complications resulted from its connection with the bishop of Urgel, etc. French speculators have endeavored to introduce gambling at the springs of Escaldas.

**ANDOVER**, a market-t. of Hampshire, lies in the n.w. part of the co., lat. 51° 12' n., long. 1° 28' w. The origin of the t. dates from a remote antiquity, as might indeed be suspected from its name, which is a modification of the Saxon *Andeafaran*, i.e., ferry over the river Ande. It is said that the corporation of A. is as old as the time of king John. The inhabitants, 5501 in 1871, are chiefly supported by their malt-trade, their agriculture, and their traffic in timber with Portsmouth. At Weyhill, a few miles to the w. of the t., a fair is held, formerly one of the most celebrated and important in England. It lasts for six days. The church of A. is a new erection, in the early English style of architecture, and cost £30,000, the whole of which was defrayed by the late rector, the Rev. W. S. Goddard. Various relics of antiquity have been discovered near Andover.

**ANDOVER**, a township in Mass., about 21 m. to the n. of Boston, reaching on the n. to the Merrimac. It is intersected by several railways, while water-power is employed in manufacturing thread, linen, and flannels. The township was incorporated in 1646, 26 years after the landing of the pilgrim fathers. Pop. '80, 5174. A. is famous, even in Massachusetts, for its educational institutions. The theological seminary of the Congregationalists, and the Phillips academy, instituted within five or six years after the close of the war of independence, through the efforts of two brothers, from whom it derives its name, are liberally constituted, and well attended. The latter has a revenue of £12,000. The Abbot female academy, for the education of female teachers, is also

a flourishing institution.—There are several other places of the same name in the United States.

ANDOVER THEOLOGICAL SEMINARY, at Andover, Mass., founded in 1807, and endowed by Samuel Abbot of Boston, John Phillips, jr., and Phoebe Phillips of Andover, Moses Brown and William Bartlett of Newburyport, and John Norris. Since the founding the funds have been increased by large donations, and now amount to \$600,000. The value of the property is \$225,000. The theological seminary was placed under the same management as Phillips academy, which had been in operation more than a quarter of a century; and its purpose was declared to be "to provide for the church a learned, orthodox, and pious ministry." It is doubtless the oldest distinctly theological school in this country. The colleges had previously supplied all the public training of candidates for the ministry. Its general plan has been taken as the model for many institutions of like purpose. The government is by a board of 13 trustees, 3 visitors, 8 professors, and a librarian. Since the foundation of the seminary, there have been 7 professors of sacred literature, 2 of Christian theology, 7 of sacred rhetoric, 4 of ecclesiastical history, 1 in the special course, and 1 of elocution. In 1879, it had 7 professors and 4 lecturers. Special lecturers address the students every year in various departments of theological or practical instruction. In 1879, the seminary had 90 students. Its graduates number more than 2000; and about 3000 students have been connected with it. Its situation is quiet and beautiful, about 23 m. n. of Boston. The seminary is under the control of Congregationalists, but is administered in a spirit of such evangelical liberality that many who are now eminent ministers in other denominations have availed themselves of its privileges. Room-rent and tuition are free, and indigent students are assisted. The course of study occupies three years, and the aim is for a solid and thorough training. It has a library of 37,000 volumes. On the roll of its professors, past and present, are names distinguished in all departments of theological learning, biblical criticism, and sacred rhetoric. Its graduates are scattered through all portions of the United States, and as missionaries in many heathen lands. Edwards A. Park, D.D., who occupies the chair of theology, has for many years edited the *Bibliotheca Sacra*, a theological quarterly of the highest rank, well known on both sides of the Atlantic.

ANDRA'DA, DIEGO PAYVA D', 1528-75; a Portuguese theologian, who distinguished himself in the council of Trent, to which he was sent by king Sebastian. He wrote several volumes of sermons, and other works. His *De Conciliorum Auctoritate* was much esteemed at Rome for the great extension of authority it accorded to the pope. His *Defensio Tridentinæ Fidei* is a rare and curious work, in which he discusses the dogma of the immaculate conception. It was published after his death.

ANDRA'DA E SYL'VA, BONIFACIO JOZÉ D', 1765-1838; a Brazilian statesman and naturalist. He studied in Paris under Lavoisier, and in 1800 was appointed professor of geology at Coimbra, and, soon after, inspector-general of the Portuguese mines. In 1812, he was made perpetual secretary of the Lisbon academy; in 1819, became one of Dom Pedro's ministers. When the independence of Brazil was declared, A. was made minister of the interior and of foreign affairs, but his democratic principles induced his dismissal from office, in July, 1823; and on the dissolution of the assembly in Nov. he was banished, living in exile in France until permitted to return, in 1829. When Dom Pedro I. abdicated, April 7, 1831, he selected A. for the guardian and tutor of Dom Pedro II. In 1833, A. was again arrested, this time for intriguing in behalf of Dom Pedro I., and was deprived of position, passing his remaining years in retirement. He wrote no large work, but many papers on mines and mining.

AN'DRAL, GABRIEL, a celebrated French physician, member of the institute and of the academy of medicine, was b. in Paris on the 6th of Nov., 1797. In 1823, he established his reputation by the publication of the first part of his *Clinique Médicale*; in 1828, partly through the influence of M. Royer-Collard, whose daughter he had married, he was appointed professor of hygiene; and in 1830, was advanced to the chair of internal pathology, a branch of medical science which had always possessed great attractions for him. A., in fact, commenced his investigations with pathological anatomy. He presented to the academy, at a comparatively early period of his career, a paper, *Sur l'Anatomie Pathologique du Tube Digestif* (on the pathological anatomy of the alimentary canal), which was greatly admired. Besides, he published, in 1829, a *Précis Élémentaire* of the same science, which met with striking success; and his *Clinique Médicale* treats principally of diseases of the chest, of the abdomen, and of the brain. In 1839, A. was almost unanimously elected by his colleagues to succeed Broussais in the chair of pathology and general therapeutics, the highest in the school. Here he has shown the vast range of his medical knowledge; but in occupying himself so much with the pathological anatomy of the dead body, it is alleged that he has not paid sufficient attention to the phenomena of disease before the organs begin to exhibit traces of alteration. Though actively engaged in his general practice, he has found time to write several other works besides those already mentioned. In 1835, appeared his *Projet d'un Essai sur la Vitalité*; in 1836, he edited and considerably enlarged Laennec's *Traité de l'auscultation Médiate et du Cœur*; in 1836-37, a *Cours de Pathologie Interne*; in 1837, his report to the academy, *Sur le Traitement de la Fièvre Typhoïde*.

par les Purgatifs; in 1843, he presented to the institute his *Traité Élémentaire de Pathologie et de Thérapeutique Générale* (published in 1840), etc.

ANDRASSY, GYULA, Count, b. 1823; of an old and noble Hungarian family. He was in the Presburg diet, 1847-48; lord-lieutenant of Zemplén co.; and led the militia against the Austrians. He was Hungarian envoy to Turkey, and, 1849-57, an exile in France and England. Returning home, he was a member of the diet in 1861, and its vice-president 1865-66. After the recognition of Hungary as a part of the Austrian empire, Deak procured the appointment of A. as prime minister Feb. 17, 1867, and he led a popular and reforming administration, working for the political emancipation of the Jews and against the temporal power of the pope. He succeeded count Beust, Nov. 9, 1871, as minister of foreign affairs, holding the place until Aug. 18, 1879, when his resignation was accepted.

ANDRÉ, JOHN, an unfortunate soldier, who met his death under circumstances which have given his name a place in history, was b. in London, in 1751, of Genevese parents. At the age of 20, he entered the army, and soon after joined the British forces in America, where, in a few years, through the favor of Sir Henry Clinton, he was promoted to the important post of adjutant-general, with the rank of major.

Sir Henry Clinton being in treaty with the American gen. Arnold, who commanded the fortress of West Point, for the betrayal to the British of the fortress, with its magazines, including the whole stock of powder of the American army, confided the conduct of the correspondence on his part to Major A. The secret correspondence was conducted by Arnold and A. under assumed names, and as if it related to commercial affairs; and the treachery was so well concealed, that the Americans had no suspicion whatever of Arnold's fidelity. At last it remained only to settle the time and means of carrying the scheme into execution; and these, it was determined, should be settled in a personal interview between Arnold and A., either because Arnold required such an interview, or, more probably, because Clinton had some misgivings as to the identity of his correspondent. Various projects to bring about the interview having failed, A., at last, on the 20th Sept., 1780, proceeded in a British sloop of war—the *Vulture*—up the Hudson nearly to the American lines. The original design was to have met under cover of a flag of truce, on the pretense of effecting some arrangement as to the sequestered property of a col. Robinson, a loyalist gentleman who accompanied A., and whose house was at the time Arnold's headquarters; but this design had to be abandoned, and Arnold was obliged to contrive a secret interview. On the night of the 21st Sept., he prevailed on a Mr. Smith, who lived within the American lines, to go to the *Vulture* with a packet for col. Robinson. Smith went, and returned with A., who passed under the assumed name of Anderson. Arnold met him on the shore, where they conferred some time, after which they went within the lines to Smith's house, and there spent the rest of the night and part of the next day arranging the details of their plan for the treacherous surprisal of West Point. The attack was fixed for the day when the return of gen. Washington was expected; and there is reason for thinking that part of Arnold's scheme was, if possible, to betray Washington also into the hands of the enemy.

Early on the morning of the 22d Sept., a gun was brought to bear on the *Vulture*, and obliged her to fall down the river so far that A. could not prevail on the boatmen to take him to her, and so was forced to make his way by land to the English lines in a disguise furnished by Smith, and provided with a pass from the general. A. actually got safely within sight of the English lines, when he was stopped and taken prisoner by three American militia-men, to whom, mistaking them for British, he inadvertently revealed the fact that he was a British officer. His captors, on searching him, having discovered concealed in his stockings the plans of West Point and other papers connected with the proposed treachery, which he was bearing from Arnold to Clinton, carried him as a spy to a col. Jamieson, who, not suspecting anything, was for sending him on to Arnold. Here a chance of escape opened for him, but only for a moment. He was ultimately sent, with the papers found on his person, to gen. Washington. Jamieson, meantime, having sent word to Arnold of the capture of A., Arnold fled to the *Vulture*, and so saved his life.

A., as a spy taken in the act, was liable, according to the rules of war, to be hanged at once. But considering the rank of the prisoner, and the circumstances, Washington resolved on referring the case to a board of general officers, to report the facts, with their opinion of the light in which the prisoner ought to be considered, and the punishment that ought to be inflicted. The board found that he ought to be considered as a spy from the enemy, and punished with death. Strenuous efforts were made by the British commander to save him. It was represented to Washington that A. could not be regarded as a spy, because—1. He entered the American lines under a flag of truce; 2. That all his movements within the lines were directed by the general. The first plea, on A.'s own authority, was contrary to the fact; and to the Americans it rightly appeared that the point of the offense lay in the communication with the base traitor Arnold. All the efforts of Clinton failed to move the American commander. A. was sentenced to death. On one condition only would Washington spare him—that the British should surrender Arnold. But this they could not think of doing; the sense of honor which, yielding to the spirit of war, offered no opposition to a bargain with Arnold for the blood

and liberties of his compatriots, made it impossible to deliver up the runaway traitor to the death that otherwise awaited the soldier who only went too far in his zeal for his country.

A. suffered death by hanging at Tappan, in the state of New York, on the 2d Oct., 1780, in his 29th year. His death everywhere excited the deepest sympathy. The whole British army went into mourning for him; a monument was erected to his memory in Westminster abbey, and in 1821 his remains were disinterred at Tappan, and conveyed to a grave near his monument.

Much has been written on the subject of A.'s execution. It has often been maintained, and recently by lord Mahon, in his *History of England* (vol. vii.), that his sentence was unjust. But a simple narrative of the circumstances, even as they are to be gathered from lord Mahon's own pages, shows that the American general had no alternative. Indeed, the circumstances cited to show that A. was not a spy, in the ordinary sense, all go to prove that he was a spy of the worst sort. The success of the treachery of Arnold would have been the destruction of the American cause; and it is hard to see how the agent who went secretly within the American lines, and was captured returning in disguise with the information that was to insure that success, is to be held in a better case than the common soldier who steals his way into the enemy's camp of a night, to see the extent of his preparations and forces.

A. was a handsome and amiable man, of considerable accomplishments; he was a good artist, and appears, when in England, to have been known to certain literary circles of his time. These circumstances naturally heightened the feeling with which his fate was regarded.

See *Biographical Dictionary* of the society for the diffusion of useful knowledge, vol. ii.; also, in vol. vi. of the *Memoirs of the Historical Society of Pennsylvania*, 1858, *The Case of Major A., with a Review of the Statement of it in Lord Mahon's History of England*, by Charles J. Biddle—an essay containing a full narrative of the case, with a discussion of all the questions of law and duty raised in connection with it.

ANDRE'A, GIOVANNI, an Italian canonist of the 14th c., of whom many remarkable stories are told, such as his sleeping every night for 20 years on the bare ground with only a bear's skin for covering; and that he had a daughter, Novella, so accomplished in law that she read his lectures in his absence, but who was so beautiful that she read behind a screen lest her face should distract attention from the theme. A. was 45 years professor of canon law at Bologna, where he died of the plague. He was the author of several works on law, but not much is known of his life.

ANDRE'A, PISANO, or ANDREA DA PISA, 1270-1345; an Italian sculptor and architect; employed on the Pisa cathedral, on the bronzes of Perugia, and on the façade of the cathedral of Santa Maria del Fiore of Florence. He made for the same church statues of Sts. Peter and Paul and of Boniface VIII., and spent some time in Venice making statues for the front of St. Mark's. Returning to Florence, he was put in charge of all public works. Among his own productions are the bronze reliefs for the gates of the baptistery, which represent incidents in the life of St. John, and which gained him the honorary citizenship of the republic. Among designs by him are the castle of Scarperia, the Venice arsenal, the church of San Giovanni at Pistoia, enlargements for the ducal palace at Florence, towers and gates for the city wall, and a citadel.

ANDREÆ, JAKOB, 1528-90; a German theologian. He studied at Stuttgart and was pastor there in 1549; in 1557, he preached to the Württemberg court, and attended the diets of Ratisbon and Frankfort. He was afterwards professor of theology and chancellor in the university of Tübingen and provost of the church of St. George. He took a leading part in Protestant discussions and movements, particularly in the adoption of a common declaration of faith by the two parties. He was one of the secretaries of the conference of Worms. In the latter part of his life he traveled in Bohemia and Germany, working for the consolidation of the reformation, conferring with pastors, magistrates, and princes. He was the author of more than 150 works, nearly all polemical and vigorously written, Lutheran for the most part, and opposed to Calvinism.

ANDREÆ, JOH. VALENT., a very original thinker and writer, b. at Herrenberg, near Tübingen, on the 17th of Aug., 1586. He studied at Tübingen, spent some time in traveling in the s. of Europe, obtained ecclesiastical preferments in the Protestant church of his native country, and d. on June 27, 1654, at Stuttgart, where he was chaplain to the court. Eminently practical in his mental disposition, he was grieved to see the principles of Christianity made the subject of mere empty disputations, and all science and philosophy in like manner perverted by a frivolous scholasticism. To the correction of this prevailing tendency of his age, the efforts of his whole life were directed. His writings are remarkable for the wit and humor, as well as for the learning, acuteness, and moral power which they display. He has been long regarded as the founder, or at least the restorer, of the order of the Rosicrucians (q.v.); and this opinion is plausibly supported by reference to three publications—the *Chymische Hochzeit Christiani Rosenkreuz* (1616), the *Fama Fraternitatis R. C.*, i.e., *roseæ crucis* (1614), and the *Confessio Fraternitatis R. C.* (1615), of the first of which he acknowledged himself the author, and the other two have so much resemblance to it as to be evidently from the same pen. But however these works were misunderstood by his contemporaries, and

particularly by those who were inclined to mysticism in religion, his intention in them was certainly not to originate or promote secret societies of mystics and enthusiasts, but to ridicule the follies of the age. He attacked Rosicrucianism itself in some of his later writings with great severity. Among the best of his works are his *Menippus s. Satyricorum Dialogorum Centuria* (1617). His *Mythologica Christiana* (1619) is another of the best known. He wrote an allegoric poem called *Die Christenburg* (of which an edition was published, Stuttg., 1836), and an autobiography (Winterthur, 1799). Herder has done much to extend a knowledge of A.'s works in the present age.

ANDRÆ, LAURENTIUS, or LARS ANDERSSON, 1482-1552; a Swedish reformer and deacon of the cathedral of Upsal. He studied in Rome, but came home a Protestant. He was made chancellor by Gustavus Vasa, who desired him to translate the Bible, in which work he was assisted by Claus Petri. A. was in high favor until he was charged with having neglected to disclose a conspiracy against the king, of which he had knowledge, for which he was sentenced to death. He escaped, however, by the payment of a large sum, and d. peacefully at Strengness.

ANDREA'NI, ANDREA, 1540-1623; an Italian painter and engraver on wood, in which art he excelled. Some of the most notable of his works are Titian's *Deluge*, *Pharaoh's Host Destroyed in the Red Sea*, *The Triumph of Caesar* (after Montegna), and *Christ Retiring from the Judgment Seat of Pilate*. From using a similar monogram his work has sometimes been mistaken for that of Altdorfer.

ANDRÉE, KARL THEODOR, b. 1808; a German journalist. He was studying at Jena, when he was arrested and tried for revolutionary complicity in 1838, but was acquitted and turned his attention to journalism. His special pursuit is geography, and for many years he has edited the *Globus*, a geographical and ethnological publication. A. has paid much attention to the western continent in his *North America*, *Buenos Ayres*, and other works.

ANDREOS'SY, ANTOINE FRANÇOIS, Count, was b. on Mar. 6, 1761, at Castelnaudary, in Languedoc, and was the great-grandson of François A., who, along with Riquet, constructed the canal of Languedoc in the 17th century. He entered the army as a lieutenant of artillery in 1781, joined the revolutionists, rose rapidly in military rank, served under Bonaparte in Italy and Egypt, accompanied him on his return from Egypt to France, and took part in the revolution of the 18th Brumaire. He was ambassador at London during the peace of Amiens, and afterwards at Vienna, was governor of Vienna when it was in the hands of the French after the battle of Wagram, and was for some time ambassador at Constantinople, from which he was recalled by Louis XVIII. on the restoration. He was raised to the peerage by Napoleon after his return from Elba. After the battle of Waterloo, he advocated the recall of the Bourbons; but as deputy from the department of Aube, he generally took part with the opposition. He d. at Montauban on Sept. 10, 1828. He was a man of eminent scientific attainments, and distinguished himself as a member of the institute founded at Cairo. One of his first works was the *Histoire Générale du Canal du Midi* (Par., 1800; new edition, 2 vols., 1805), in which he asserted the right of his great-grandfather to honors long enjoyed by Riquet. Among the most valuable of his works are his *Mémoire sur l'Irruption du Pont-Euxin dans la Méditerranée*, his *Mémoire sur le Système des Eaux qui abreuvent Constantinople*, and his *Constantinople et le Bosphore de Thrace pendant les Années 1812-1814 et pendant l'Année 1826* (Par., 1828), a work of importance in physical geography.

ANDRÉS', JUAN, 1740-1817; a learned Spanish Jesuit, and a teacher of philosophy at Ferrara until the suppression of the college. He wrote much on scientific subjects, on music, art, and teaching the deaf and dumb; but his main work was *On the Origin, Progress and Present State of All Literature*, in Italian. He was keeper of the royal library at Naples, in 1806; became blind in 1815, and retired to Rome.

ANDREW, a co. in n.w. Missouri, on the Kansas border; intersected by the Platte and other streams, and having railroad communication with St. Joseph; 425 sq.m.; pop. '80, 16,126—401 colored. The soil produces cereals and tobacco, and coal has been found. Co. seat, Savannah.

ANDREW, the first disciple of Christ, and afterwards an apostle, was, like his brother Pêter, a fisherman. Previous to his recognition of Christ as the Messiah, he had been numbered among the disciples of John the Baptist. (See John i. 40, 41.) The career of A. as an apostle, after the death of Christ, is unknown. Tradition tells us that, after preaching the gospel in Scythia, northern Greece, and Epirus, he suffered martyrdom on the cross at Patræ in Achaia, 62 or 70 A.D. A cross formed of beams obliquely placed is styled St. A.'s cross. In the early times of the church, a spurious supplement to the Acts of the Apostles was circulated among certain sects under the title *Acta Andree*. The anniversary of St. A. falls on Nov. 30. St. A. is the patron saint of Scotland; he is also held in great veneration in Russia, as the apostle who, according to tradition, first preached the gospel in that country. In both countries there is an order of knighthood named in his honor.

ANDREW, or ANDRÁS, I., King of Hungary from 1046 to 1058; cousin of St. Stephen, the introducer of Christianity. A. fought with varying fortune against Henry

III. of Germany, and against his own brother, Bela, and was finally defeated by Polish and Hungarian opponents. He d. in 1061.

**ANDREW II.**, 1176-1236; King of Hungary in 1205, after a civil war with his nephew, Ladislas III. In 1217, he conducted an unsuccessful crusade against the Moslem powers. In 1222 he granted the golden bull called the magna charta of Hungary, which confirmed the rights and titles of the bishops and nobles whose revolts had disturbed his reign.

**ANDREW III.**, d. 1301; the last Hungarian king of the Arpad family; grandson of Andrew II.; b. in Venice and succeeded Ladislas IV. in 1290. He had to defend his crown against the pretensions of Rudolph of Hapsburg and pope Nicholas IV., both being claimants, and also against a son of the king of Naples, who claimed to be of the house of Arpad by his mother. His reign was brief and disturbed by rebellion.

**ANDREW, JAMES OSGOOD, D.D.**, 1794-1871; b. Georgia; an itinerant Methodist Episcopal preacher of South Carolina conference, consecrated bishop at Philadelphia in May, 1832. On his social relations began the division of the M. E. church into "North" and "South." His second wife was a slave-holder, and in the general conference of 1844 it was declared that "this would greatly embarrass the exercise of his office as an itinerant general superintendent, if not in some places entirely prevent it," and it was resolved "that it is the sense of this general conference that he should desist from the exercise of this office so long as this impediment remains." The southern delegates protested that the action was extrajudicial and unconstitutional, and the difficulty was finally settled by dividing the churches and property into the northern and southern jurisdictions. Bishop A. adhered to the south, and continued his episcopal work until 1868, retiring then from age. He wrote on *Family Government*, and other subjects.

**ANDREW, JOHN ALBION, LL.D.**, b. Maine, 1818; d. Boston, 1867; a graduate of Bowdoin in 1837. He was admitted to the Boston bar in 1840; practiced there 20 years, and was conspicuous in cases arising under the fugitive slave law. In 1858 he was a member of the legislature; in 1860 he was a delegate in the national convention which nominated Lincoln for president, and was himself elected governor of Massachusetts by the largest vote ever given for a candidate. He foresaw the danger of civil war and took immediate steps to perfect the organization of the militia of his state. Within a week after the first call for troops he sent forward five infantry regiments, a battalion of riflemen, and a battery of artillery. In 1861, and yearly until he insisted on retiring in 1866, he was re-elected governor, and he was in all the war conspicuous for his friendly care of soldiers. He was at the conference of loyal governors in Sept., 1862, and wrote the address presented by them to the president. In religion he was Unitarian; and presided at the first national convention of that denomination in 1865. He declined the offered presidency of Antioch (Ohio) college.

**ANDREW, ST.** or **THE THISTLE**, a Scottish order of knighthood, named after the patron saint of Scotland. Nisbet, with pardonable partiality, prefers it to all other orders, purely military, "chiefly for the antiquity of it, which gives it a place and precedence over all other orders now in being." (*Heraldry*, part iv. c. xi., p. 107.) He then proceeds, after bishop Lesley, to recount the story of the St. A.'s cross having appeared in heaven to Achatus, king of Scots, and Hungus, king of the Picts, as a sign of the victory which they should gain the following day over Athelstane, king of England; and their subsequent vow, when the prophecy was fulfilled, to bear it on their ensigns and banners. It is frequently said to have been recognized as an order of knighthood in the reign of James V., and after a period of abeyance, to have been revived by James II. of Great Britain in 1687. For the actual facts of the case see, however, the article

#### THISTLE, ORDER OF THE.

The star of the order of the thistle is worn on the left side. It consists of a St. A.'s cross of silver embroidery, with rays emanating from between the points of the cross, in the center of which is a thistle of gold and green upon a field of green, surrounded by a circle of green, bearing the motto of the order in golden characters.

The badge or jewel is worn pendent to the collar, or to a dark-green ribbon over the left shoulder, and tied under the arm. It consists of a figure of St. A. with the cross enameled and chased on rays of gold; the cross and feet resting upon the ground of enameled green. The collar is of thistles, intermingled with sprigs of rue. By a statute passed in May, 1827, the order is to consist of the sovereign and 16 knights. The letters K.T. are placed after the names of knights of the order. The motto is *Nemo me impune lacessit*. Nisbet, differing from Sir George Mackenzie, prefers *laccesset*, as "having more of daring and gallantly."

**ANDREW, ST.** **THE RUSSIAN ORDER OF**, is the highest in the empire, and was founded by Peter the great in 1698. It is confined to members of the imperial family, princes, generals-in-chief, and others of like rank. The badge of the order shows on the obverse a cross enameled in blue, bearing a figure of the saint surmounted by a crown, and in the four corners of the cross the letters S. A. P. R. (*Sanctus Andreas Patronus Russiae*). On the reverse is a spread eagle, with the legend (in Russian) *For religion and loyalty*, and the name of the saint. The collar consists of St. A.'s crosses alternating with imperial crowns.

ANDREWS, EDWARD GAYER, D.D., b. N. Y., 1825 : a graduate of Wesleyan university in 1847. The next year he began ministry in the Methodist Episcopal church, and was a teacher in Oneida conference seminary, becoming its president in 1855. He resumed the pastorate in 1864 in New York east conference, and was elected bishop in 1872.

ANDREWS, ETHAN ALLEN, LL.D., 1787-1858; b. Conn.; a graduate of Yale. He published a number of school-books, and, in 1850, a good Latin-English lexicon.

ANDREWS, GEORGE L., b. Mass., 1827, graduated first in his class at West Point in 1851, was acting assistant professor of engineering there in 1854-55. For distinguished services in the army of the Potomac he was made brevet brigadier and major-general of volunteers. In 1871, he became professor of French at West Point military academy.

ANDREWS, JAMES PETTIT, 1737-97; an English historian. He left unfinished a *History of Great Britain, Connected with the Chronology of Europe*, commencing with Cæsar's invasion; the English history on one page and the synchronous European history on the opposite page. He continued Henry's history, and made a good collection of anecdotes.

ANDREWS, LANCELOT, an eminent English prelate, was b. in London in 1555, and educated successively at the Coopers' Free School, Ratcliffe, Merchant Taylors' School, and Pembroke Hall, Cambridge, of which college, after having greatly distinguished himself by his industry and acquirements, he was in 1576 elected a fellow. On taking orders, he accompanied the earl of Huntingdon to the north of England. His talents attracted the notice of Walsingham, queen Elizabeth's secretary of state, who appointed him successively to the parsonage of Alton, and the vicarage of St. Giles, Cripplegate. In 1589 he was appointed a prebendary and canon residentiary of St. Paul's, a prebendary of the collegiate church of Southwell, and master of Pembroke Hall. The queen next testified her esteem for his gifts and piety by appointing him one of her chaplains in ordinary, and a prebendary and dean of Westminster. He rose still higher in favor with king James, who was well qualified to appreciate his extensive learning and peculiar style of oratory. He attended the Hampton Court conference, as one of the ecclesiastical commissioners, and took part in the translation of the Bible. The portion on which he was engaged was the first twelve books of the Old Testament. In 1605 he was consecrated bishop of Chichester. In 1609 he was translated to the see of Ely, and appointed one of his majesty's privy-councillors, both for England and Scotland. To the latter country he accompanied the king in 1617, as one of the royal instruments for persuading the Scotch of the superiority of episcopacy over presbytery. In the following year he was translated to Winchester, where he d. on the 27th Mar., 1625. Bishop A. was, with the exception of Usher, the most learned English theologian of his time. As a preacher, he was regarded by his contemporaries as unrivaled; but the excellent qualities of his discourses are apt to suffer much depreciation in modern judgment from the extremely artificial and frigid character of the style. His principal works published during his life were two treatises in reply to cardinal Bellarmine, in defense of the right of princes over ecclesiastical assemblies. His other works consist of sermons, lectures, and manuals of devotion. Bishop A. was the most eminent of that Anglican school in the 17th c. of which the 19th has seen a faint revival under the name of Puseyism. Its distinctive peculiarities were high views of ecclesiastical authority, and of the efficacy of sacraments, ceremonies, and apostolic succession, and extreme opposition to Puritanism. In his private life, A. was singularly pious, meek, and charitable.

ANDREWS, LORRIN, 1795-1868; b. Conn., educated at Jefferson and Princeton colleges, and went as missionary to the Sandwich islands in 1827. In 1831 he founded what became the Hawaiian university, in which he was professor. He was long privy-councillor and judge under the native government. He wrote a Hawaiian dictionary, and published part of the Bible in that tongue; he also wrote on the history of the islands.

ANDREWS, ST., an ancient city of Scotland, is situated on the bay of the same name, in Fifeshire, about 10 m. from Cupar, and 44 m. from Edinburgh. Tradition dates the origin of this city as far back as the 9th c., when St. Regulus or Rule is said to have taken refuge in this place, then called Mucros, and afterward Kilrymont, bringing with him some of the bones of St. Andrew, which, being enshrined here, continued to be an object of pilgrimage for several centuries. A cave on the sea-shore still bears the name of St. Rule. He would seem to have founded a Culdee monastery, of which the Scottish king Constantine, having resigned his crown, became abbot about the year 940. Probably about the same time, it became the seat of a prelate, who, as "bishop of the Scots," continued to enjoy a certain pre-eminence among the other bishops, until, in 1471, the see was erected into an archbishopric, when he became primate. In the reign of Alexander I., a priory of canons regular was founded at St. A., which afterwards became one of the chief ecclesiastical establishments in Scotland. The last prior was the regent Moray. In 1140 St. A. was created a burgh by the bishop, with consent of king David I. The cathedral, commenced in 1162, and consecrated in 1318, was sacrificed in 1559 to the frenzied zeal of the mob, an outrage which it is customary to attribute to the preaching of Knox. The eastern gable, part of the western, and part of the south side wall and of the transept, are all that remain of this building. It was the second cathedral of St. A.,

the first being what is now called St. Rule's church, but was long known as "the old cathedral." Of this interesting little edifice, built between 1127 and 1144, the roofless chancel, and a square tower 108 ft. high, are still preserved. They are in the romanesque style.

The university of St. A., the oldest in Scotland, was founded by bishop Wardlaw in 1411. It consists of the united college of St. Salvator, founded by bishop Kennedy in 1456, and St. Leonard, founded in 1512; and St. Mary's college, founded by Beaton in 1537. The education in the latter is exclusively theological. The number of chairs in the colleges which constitute the university is 14, and the attendance of late years has been rather less than 200. The castle, once a very extensive and strong building, is now in ruins. It was for some time the residence of cardinal Beaton, who was assassinated here in 1546. As the ecclesiastical metropolis of Scotland, an ancient seat of learning, and the center of a considerable trade, St. A., at the time of the reformation, was an important and flourishing city. Since that period, it has greatly declined in importance; but its excellent educational establishments and convenience as a watering-place still make it an eligible residence for a highly respectable population. Its chief interest is still connected with the past. Here, in the center of the papal jurisdiction in Scotland, the reformation first made its appearance; Scotland's proto-martyr, Patrick Hamilton, suffered here in 1528, and George Wishart in 1546, and here John Knox first opened his lips as a preacher of the reformed faith. The trade of St. A. is inconsiderable. The harbor is difficult of access, and particularly exposed to the e. wind. A few coasters and fishing-boats constitute all the shipping of the port. St. A. is much frequented as a bathing-place, and the game of golf is more practiced than anywhere else in Scotland on the links or downs which stretch along the shore to the n. of the t. for about two miles. Besides its university, St. A. affords singular advantages for cheap and excellent education in the Madras college, established by the well-known Dr. Andrew Bell, which attracts a very large number of pupils, the annual average being about 900. The grammar school and commercial school are incorporated with it. St. A. is a royal and parliamentary burgh, and unites with several smaller burghs in returning a member to parliament. The corporation includes a provost, dean of guild, and four bailies. Pop. in 1851—parish, 6740; parliamentary burgh, 5107; 1871, parliamentary burgh, 6316.

ANDREWS, STEPHEN PEARL, b. Mass., 1812; a student of social science and philology. He has written much on themes of society, government, and language. Among his works are: *Comparison of the common law with the Roman, French, and Spanish civil law, on entails, and other limited property, in real estate; Love, Marriage, and Divorce; French without a master*; phonographic readers and class-books: and a phonographic reporter.

ANDRIA, a c. of south Italy, in the province of Bari, 31 m. w. from the t. of Bari. It stands on a plain, and in its vicinity are numerous caverns (*antra*), whence its name. Its cathedral, a fine edifice, was founded in 1046. During the wars of the Parthenopean republic (q. v.), it was besieged by the republican army under gen. Broussier, and being taken after a gallant resistance, was burned, at the suggestion of Ettore Carafa, count of Ruvo, himself its feudal lord. The neighboring country is famous for its almonds, which are a principal article of trade of the city. Pop. '72, 34,034.

ANDRIEUX, FRANÇOIS GUILLAUME JEAN STANISLAUS, a French writer of comedies, was b. at Melun, May 6, 1759. In 1798, he was elected deputy of the Seine department, and distinguished himself by his speeches on several points of public interest. In 1800, he was made secretary, and soon afterwards president of the tribunal. From this post he was removed by Bonaparte in 1802, and afterwards devoted himself to literature. During his political career he had written a comedy, *Les Etourdis*, 1787. From 1803 to 1815, he held a professorship in the polytechnic school, and in 1814 was appointed professor in the collège de France. Louis XVIII. gave him a place in the academy in 1816, of which he was made perpetual secretary in 1829. In this position he took an active part in the preparation of the *Dictionnaire de l'Académie*. His most popular dramas were *Molière avec ses Amis*, *Le Vieux Fat*, and the tragedy of *Brutus*. A collection of his æsthetic lectures was published under the title *La Philosophie des Belles Lettres* (Paris; 1828). He d. May 10, 1833.

ANDRIS'CUS, or PSEUDO PHILIP, a person of mean origin, who claimed to be a son of Perseus, the last king of Macedonia. He was imprisoned in Rome because of this pretense, but escaped and found partisans enough in Thrace to defeat the prætor Juventius, who had been sent against him. After a brief reign of cruelty and extortion he was defeated, 148 B. C., taken to Rome by Q. Cæcilius Metellus, and put to death. But the recapture of Macedonia cost Rome 25,000 men.

ANDROCLUS, or AN'DROCLES; a Roman slave, perhaps a tamer of wild animals, who led about the streets a lion which had refused to attack him when set loose upon him in the arena. But Aulus Gellius says that A. took refuge from a severe master in an African cave, where came a lion with an injured foot which the slave cured, after pulling out a large thorn, and the grateful animal followed him thereafter. Aulus Gellius relates the story as having come to him from an eye-witness.

**ANDROGYNOUS** (i.e., male-female; from two Greek words), a term sometimes employed in botany to designate an inflorescence which consists of distinct male and female flowers; and more frequently in zoology in reference to animals which possess a distinct male and female generative system in the same individual. This is the case with very many of the lower kinds of animals, but is not inconsistent with a necessity for the co-operation of two individuals in the propagation of the species. See HERMAPHRODITE, PHYSIOLOGY and REPRODUCTION.

**ANDROMACHE**, the wife of Hector, was the daughter of king Etion of Thebes, in Cilicia, and is one of the finest female characters in Homer's *Iliad*. During her childhood, Achilles slew her father and her seven brothers. Her love of Hector is pathetically depicted in her address to the hero on his going to battle and her lamentation over his death (*Iliad*, 6 and 24). After the fall of Troy, she was given into the hands of Pyrrhus (son of Achilles), who took her away to Epirus, but afterwards surrendered her to Helenus (Hector's brother), by whom she had a son named Cestrinus. A. is the heroine of one of the tragedies of Euripides.

**ANDROMEDA**, daughter of the Ethiopian king Cepheus, by Cassiopeia, was, like her mother, remarkably beautiful. When Cassiopeia, with motherly pride, boasted that her daughter was more beautiful than the Nereids, these offended deities prayed Neptune to revenge the insult. Accordingly, the territory of king Cepheus was devastated by a flood; and a terrible sea-monster appeared, whose wrath, the oracle of Ammon declared, could only be appeased by the sacrifice of A. As A. was fastened to a rock, and left as a prey to the monster, Perseus, returning from his victorious battle with Medusa, saw the beautiful victim, and determined to rescue and win her. Having slain the sea-monster, he received A. as his reward. Minerva gave A. a place among the constellations.

**ANDROMEDA**, a genus of plants of the natural order *Ericaceæ* (q.v.), distinguished by a 5-valved naked capsule, which splits up through the back of the cells; anthers with two awns, and a globose corolla with the orifice contracted. The species, which are pretty numerous, have very much the general appearance of heaths. Most of them are small shrubs, but some attain a considerable size. The only British species is *A. polifolia*, occasionally found in peat-bogs in different parts of the country, and common throughout the north of Europe and of North America, a small evergreen shrub with beautiful rose-colored drooping flowers. It has acrid narcotic properties, and sheep are sometimes killed by eating it. The shoots of *A. ovalifolia* in like manner, poison goats in Nepal; and similar effects are ascribed to *A. maritima* and other species in the United States.—*A. fastigiata* was observed by Dr. Hooker abounding at great elevations in the Himalaya; a humble shrub, resembling the heather of Scotland. The leaves are used as a substitute for tea. See SORREL-TREE.

**ANDRONICUS**, the name of three Byzantine emperors.—A. I., the son of Isaac Comnenus, was one of the most conspicuous characters of his age, which produced no man more brave, more profligate, or more perfidious. His life was full of extraordinary vicissitudes. During part of his youth, he was a prisoner of the Turks in Asia Minor. He afterwards spent some time at the court of his cousin, the emperor Manuel, and a niece of the emperor became his mistress. He was appointed to a military command in Cilicia; but although his courage, his noble appearance, and his gracious manners made him the favorite of the army, his imprudence and waste of time in dissolute pleasures involved him in defeat. Having engaged in a treasonable correspondence with the king of Hungary and the German emperor, he was thrown into prison by Manuel, and remained there above 12 years; but at last succeeded in making his escape, and, although not without further extraordinary adventures, reached Kiew, the residence of the grand duke Jaroslav. He regained the favor of his cousin by persuading the Russian prince to join him in the invasion of Hungary, and by his gallantry in that war; but incurred his displeasure again by refusing to take the oath of allegiance to the prince of Hungary, the intended husband of Manuel's daughter, as presumptive heir to the empire. He was sent in honorable banishment to Cilicia, where he found a new mistress in a sister of the empress. The resentment of the emperor breaking out against him, he sought refuge in a pilgrimage to Jerusalem. His professions of zeal made his former conduct to be forgotten, and he was invested with the lordship of Berytus; but his profligacy became, if possible, more scandalous than ever in the seduction of Theodora, the widow of Baldwin, king of Jerusalem, who lived with him for years as his mistress. The emperor's anger made Palestine unsafe for him, and he fled with Theodora to Damascus, and finally settled among the Turks in Asia Minor, with a band of outlaws, making frequent inroads into the Roman province of Trebizond; from which he carried away spoil and slaves. Theodora and her children were at last taken and sent to Constantinople, and thither he followed, imploring, with a chain about his neck, and in a form of abject submission, the forgiveness of the emperor, which he obtained, but was sent to Oenoe in Pontus. After the death of Manuel, popular indignation was excited against the empress, who acted as regent for her son, Alexius II., and A. was recalled in 1182 to deliver the empire from her tyranny. He was appointed guardian of the young emperor, and soon after, his colleague in the empire. He caused the empress-mother to be strangled, and afterwards Alexius himself, with whose widow he contracted an indecent marriage. His reign, though short, was vigorous, and restored prosperity to the

provinces; but tyranny and murder were its characteristics in the capital. He set no bounds to the gratification of his revenge against all who had ever offended him, and his jealousy of possible rivals was equally sanguinary. At last, a destined victim, Isaac Angelus, one of his relatives, having fled to the church of St. Sophia for sanctuary, a crowd gathered, and a sudden insurrection placed Isaac on the throne, whilst A., now 73 years of age, was put to death by the infuriated populace, after horrible mutilations and tortures, on Sept. 12, 1185. He was the last of the Comneni that sat on the throne of Constantinople; but the succeeding dukes and emperors of Trebizond were descendants of his son Manuel.—A. II., the son of Michael Palæologus, ascended the throne in 1283; but after a weak and inglorious reign, was driven from it in 1328 by his grandson, A. III., who, after a reign equally inglorious, d. in 1341. During these reigns, province after province was conquered by the Turks.

**ANDRONICUS**—surnamed **CYRRHESTES** from his birthplace, Cyrrhos in Syria—is said to have erected the octagonal tower called the tower of the winds at Athens, a building of the 3d or 2d c. B.C. It probably received its name from figures representing the eight principal winds, and from a brazen Triton which surmounted it, and showed the direction of the wind—the first known weathercock.

**ANDRONICUS** of Rhodes, a peripatetic philosopher, lived at Rome in Cicero's time, and employed himself in criticising and explaining the works of Aristotle, a great number of which he was probably the means of preserving to us. None of the writings of A. himself are extant; for the works ascribed to him are probably the productions of *Andronicus Callistos*, a learned Greek of the 15th century.

**ANDRONICUS**, **LIVIVS**. See **LIVIVS ANDRONICUS**.

**ANDROPOGON**. See **LEMON-GRASS**.

**ANDROS**, an island of the Greek archipelago, the most northern of the Cyclades, separated from Eubœa by a channel, the Doro channel, 6 m. broad. The island is 21 m. long, and about 8 m. in its greatest breadth. Its eastern coast is very irregular. It is very mountainous, and on some of its mountains snow lies during great part of the year. The soil is very fertile, and wine, silk, wheat, barley, lemons, oranges, and pomegranates are produced. Silk is the chief article of export. The population is supposed to be about 16,000. The chief town, **ANDROS**, is situated on a bay of the eastern coast. It has manufactures of silk and carpets, and a large port, which, however, is suitable only for small vessels. Pop. 5000.

**ANDROS**, **Sir EDMUND**, 1637-1714; son of an officer in the English royal household, a major in prince Rupert's dragoons. In 1674, he was sent to America as governor of the colony of New York, and to him Sir Anthony Colve, the governor during the temporary Dutch supremacy, surrendered without forcible opposition. A. was in more or less trouble with the English colonies over which he claimed authority, and deposed Carteret of East Jersey in 1680. The next year he was called home under accusation, but managed to escape serious prosecution. When the New England colonies were consolidated in 1686, A. was made governor-general with large powers. He was to admit religious toleration, but could suppress all printing, name and change his council at will, and, with their consent, levy taxes and control the militia. Connecticut refusing to obey his orders, he appeared in the council chamber at Hartford, in Oct., 1687, with an armed guard, and demanded the surrender of the colony's charter. Evidence is wanting for the story of the hiding of the charter in the oak tree; a duplicate may have been so hidden, but A. seems to have secured the original document. In 1688 New York and New Jersey were attached to New England and his rule extended over them. On hearing of the revolution in England the people of Boston imprisoned A. and some of his officers, April 18, 1689, and Leisler set up a rebel government in New York. In July, A. and a committee of accusers were ordered to England, but he was acquitted without formal trial. In 1692, he came back as governor of Virginia, where he was popular, retiring in 1698, and becoming governor of Guernsey in 1704-6. In 1691, he published an account of his proceedings in New England.

**ANDROSCOGGIN**, a co. in s.w. Maine; 400 sq.m.; pop. '70, 35,866; noted for extensive water and manufactures on the two Androscoggin rivers. Agriculture is the main business; dairy products are exported. The Portland branch of the Grand Trunk, the Maine Central, and other railroad lines, traverse the county. Co. seat, Auburn.

**ANDROSCOGGIN**, a river in Maine and New Hampshire, rising in Umbagog lake and emptying into the Kennebec above Bath. It is 157 m. long, about half of it in each state.

**ANDUJAR**, a t. of Andalusia, Spain, in the province of Jaen, 24 m. n.n.w. from Jaen, on the right bank of the Guadalquivir, at the base of the Sierra Morena. Its streets are irregular, but many of the houses are well built. The river is crossed by an old dilapidated bridge. The situation of the town is unhealthy. The inhabitants are mostly employed in agriculture; but there is some trade in grain, fruit, oil, and cattle, the produce of the neighboring country, and the town is famous for the manufacture of the porous cooling clay water-vessels which are in general use throughout Spain. The convention of Baylen was signed here on 23d July, 1808. Pop. 12,000.

**ANDVA'RI**, in Norse mythology, the name of the fish-shaped dwarf who owned the ring, with the curse of ill-obtained gold, fatal to the possessor. This is the key-note of the remarkable stories of Sigurd Fafnisbane and the German legends recently written in music by Wagner in an elaborate trilogy, consisting of "The Rhinegold" (the temptation), the "Valkyria" (or Fates), "Siegfried" (the hero), and "Die Gotterdammerung" (the "Twilight of the Gods," or end of all things).

**ANECDOTE**, from the Greek, originally meaning something not published. Proprius called his secret history of Justinian's court *Anecdota*. It is applied also to portions of ancient writings long unpublished, and a number of such *Anecdota* have been collected in volumes and printed. As ordinarily used, A. now means some isolated fact, usually of a personal nature, which would interest a listener. There are a great many books of A., the most celebrated in English being the *Percy Anecdotes*.

**ANEGADA**, the most northerly of the Lesser Antilles, its lat. being about 19° n., and its long. between 64° and 65° w. It contains about 13 sq. m., with a scanty population of little more than 200. It belongs to England. It is of coral formation, being, like most islands of the kind, low and beset by reefs. One reef in particular, which runs out 10 m. to the s.e., is marked, even on ordinary maps, as the scene of numerous shipwrecks.

**ANEL**, DOMINIQUE, about 1679-1730; a French surgeon, inventor of the probe and syringe, bearing his name; skillful in treating aneurism and fistula lachrymalis.

**ANEMOMETER** (Gr. *anemos*, the wind, and *metron*, a measure; Fr. *anémomètre*, Ger. *Windmesser*), an instrument for measuring the strength and velocity of the wind. The simplest and best A. is that which is generally known as Robinson's hemispherical-cup A. It consists of four hollow hemispheres or cups fixed to the ends of two horizontal iron rods crossing each other at right angles, and supported on a vertical axis which turns freely. The cups revolve with a third of the wind's velocity, and the instrument is so constructed that 500 revolutions are made whilst a mile of winds passes over it. The revolutions are registered by a system of wheels similar to those of an ordinary gas-meter. The difference between two readings gives the number of revolutions passed over during the intervening time, from which the miles can be calculated, and the rate per hour.

The following table gives approximately the relation of the height of the water in the A. to the force and velocity of the wind in winds of different characters. (See AERODYNAMICS.)

	Height of water.	Pressure per square foot.	Velocity per hour.
Feeble wind.....	$\frac{1}{4}$ in.	$\frac{1}{16}$ lbs.	4 $\frac{1}{16}$
Fresh breeze.....	$\frac{1}{2}$ "	$\frac{1}{10}$ "	16 $\frac{1}{10}$
Very strong wind.....	1 "	$\frac{5}{16}$ "	32 $\frac{5}{16}$
Tempest.....	4 "	$\frac{20}{16}$ "	65

Pressure anemometers are of very great importance in meteorological observatories. Of these, the most complete is that invented by Osler. In this instrument, the force of the wind is ascertained in a different way from the hemispherical-cup A. A brass plate one foot square is suspended by means of springs, and being attached to the vane of the instrument, is maintained at right angles to the direction of the wind. This plate, by the action of the wind, is beaten back upon the springs, and in so doing, causes a pencil to move backwards and forwards on a sheet of paper placed below it. This sheet of paper is made to pass under the pencil in a direction at right angles to its oscillation; and by means of clock-work, moves at a uniform rate, so that the force of the wind at any particular time of the day is recorded with perfect accuracy. A pencil in connection with the vane, and moving in the same transverse line as the former, records the changes in the direction of the wind; and a third pencil, guided by a rain-gauge, registers the quantity of rain that has fallen. The preceding sketch, taken from the first half of a daily register-sheet, gives an idea of the kind of record made by an Osler's A. The space between two upright lines indicates an hour; that between two horizontal lines, in the rain-register  $\frac{1}{16}$  of an inch of rain, in the direction of the wind two cardinal points, and in the force of the wind 1 lb. of pressure on the square foot.

Register-sheet of an Osler's anemometer.

Thus, on the day in which these lines were traced, there was in the rain-register, brought over from the former account, between .10 and .15 of an inch; and during the 12 h., the pencil had only risen one space, indicating a fall of .05, or  $\frac{1}{20}$  of an inch, almost entirely between the hours of 3 and 4 in the morning, and immediately before 12

in the day. If the day had been very rainy, and the pencil had risen to the top of the register, it would have fallen immediately to the bottom of it, and begun a new account; and it might have done so several times in the course of the twelve hours. This would have been effected by the mechanism connected with the rain-gauge, which enables the gauge to empty itself each time that the pencil reaches the top of the rain-register. As regards the direction of the wind, it was, during the first six hours, s., veering slightly towards the e.; and for the last six hours, it was tending decidedly towards the w., being between 10 and 11 nearly west. From the line marking the force of the wind, it will be seen that the day was stormy. Between 1 and 2, and at 11, the wind was blowing a very high gale, producing a pressure of upwards of 12 lbs. on the sq.ft.; and between the hours of 4 and 5, there was a decided lull, the wind being brisk, but not stormy (2 to 3 lbs.). Both the hemispherical-cup A. and the pressure A. are equally indispensable in fully equipped observatories. The former registers the quarterly wind which passes over the place, but cannot register the force of those sudden and almost instantaneous gusts of wind to which storms and hurricanes owe their destructive energy.

In Lind's A., the wind, entering the mouth of one of two upright glass tubes, connected below, depresses the column of water contained in the one tube, and raises proportionately that in the other. This A. is convenient for rough purposes.

**ANEMONE**, a genus of plants of the natural order *ranunculaceae*, having an involucre of three divided leaves, more or less remote from the flower, a petaloid calyx, scarcely distinguishable from the corolla, and soft woolly achenia (see *ACHENIUM*), which in some species have tails. The name is originally Greek, and is said to be derived from the word for *wind*, because many of the species love very exposed situations. The species are numerous, and generally beautiful. Most of them flower early in spring. They are natives of temperate and cold climates, chiefly of the northern hemisphere. One species, *A. nemorosa*, the wood A., is a common native of all parts of Britain, and its white flowers, externally tinged with purple, are an ornament of many a woodland scene and mountain pasture in April and May. Another species, *A. pulsatilla*, the pasque flower, adorns chalky pastures in some parts of England at the same season. Its flowers are purple and externally silky. The garden A. is a favorite florist's flower; the varieties are very numerous, and whole works have been published on them and their cultivation, which is most extensively carried on in Holland, and has prevailed from a very early period. It is generally supposed that all these varieties have originated from two species, *A. coronaria* and *A. hortensis* or *stellata*. Both are natives of the Levant; the latter is found also in Italy and the south of France. By cultivation, the size of the flower is increased, its form and colors are modified, and many of the stamens are often changed into small petals, forming a sort of *heart* of the flower. The cultivation of A. requires great attention. It prefers a light soil. The root, which consists of clustered tubers, is taken up after flowering. The plant is propagated by parting the roots, or by seed. In the latter way, new varieties are obtained. Seedling plants do not flower till the second or third year.—Besides the species which have been named, others occasionally appear as ornaments of our flower-gardens. *A. apennina* and *A. pratensis* have beautiful blue flowers. They are both natives of the south of Europe. *A. japonica*, a most beautiful species, has recently been introduced from Japan.—The species of this genus are characterized by the acidity prevalent in the natural order to which they belong; and the rhizomes of *A. nemorosa* and others have been recommended in obstinate rheumatism and in tania.—The genus *hepatica* was formerly included in A. *H. triloba* (*A. hepatica*), with 3-lobed leaves, grows wild in most parts of Germany and throughout the n. of Europe, but is not a native of Britain. It is also found in North America. Varieties of different colors, and both single and double, are among the finest ornaments of our flower-borders in early spring. The plants are very apt to suffer from being removed or having the earth much loosened about them, and must be permitted to remain as much as possible untouched.

**ANEMONE, SEA**, a popular name of the species of *actinia* (q.v.) and some other *actiniadae*. It seems to have been first applied to them about a century ago by Ellis, one of the most celebrated investigators of the department of natural history to which they belong, who remarks that "their tentacles, being disposed in regular circles, and tinged with a variety of bright lively colors, very nearly represent the beautiful petals of some of our most elegantly fringed and radiated flowers, such as the carnation, marigold, and anemone." It is only, however, when in their proper element and undisturbed that the sea-anemones expand their tentacula and exhibit their beauty. When left dry by the receding tide, they contract into a jelly-like mass, usually hemispherical or conical, with a puckered hole in the top. The most common of all the British species of sea-A. is the *actinia mesembryanthemum*, which has received its specific name from another floral association. It attaches itself to rocks and stones from low-water almost to high-water mark, and when left by the tide appears as a sub-conical liver-colored or greenish mass, not more than 1 to 1½ in. in diameter, which, when touched, is found to be very smooth and slippery, but of pretty firm consistency. The tentacula, when fully extended, are in length nearly equal to the height of the body, and are nearly of the same color. An azure line frequently encircles the base; and on the base are dark-green lines converging towards the center, and which are formed by radiating vertical plates in the fleshy

substance of the animal, analogous (although not calcareous) to the calcareous partitions in the single-starred madrepores. Around the margin of the mouth there is a circle of azure tubercles, like turquoise beads of the greatest beauty. These are only to be seen when the mouth is pretty fully expanded. They are about 25 in number in full-grown specimens. Their use is not known, though they have been conjectured to be eyes.—A smaller species, *actinia* (or *sagartia*) *trogloodytes*—olive-green, with snow-white stripes and numerous tentacula—is pretty common on the British shores, inhabiting holes in the rocks, often the deserted holes of the *pholas*, above which its oval disk and tentacula scarcely rise, and into which it quickly withdraws upon being disturbed. A number of species inhabit holes as this does.—*Actinia* (or *bunodes*) *coriacea*, which attains a diameter of 2 in., attaches itself to sand-covered rocks, and is often much buried in the sand. It is covered with pale perforated warts, which have the power of agglutinating to themselves sand, gravel, fragments of shell, etc.; so that, when the tide is out, the animal is readily passed over by the inexperienced eye as a mere inequality in the surface of the sand, unless some accidental pressure cause it to squirt out water through its tentacula, as, in such circumstances, many of the species are very apt to do, sometimes to the annoyance of those who incautiously meddle with them.—*Actinia* (*bunodes*) *crassicornis* is one of the largest and most beautiful British sea-anemones, being about 4 in. in height, and fully more when expanded between the tips of the opposite tentacula. It exhibits great diversity of the most beautiful colors. Red is usually predominant; the surface of many is variegated with white, or with orange-green and yellow. It occurs almost totally white, cream color, sulphur yellow, and bright scarlet, with pale warts like ornamented beads.—Beauty of color and form are still more abundantly lavished on *actinia dianthus*, a still larger species, with very numerous tentacula, which inhabits deep water.—*Anthea cereus* is, on some parts of the coast, one of the most abundant sea-anemones. Its tentacula are from 120 to 200 in number, are longer than in the *actiniae* generally, and are incapable, it is said, of being retracted, as in the true *actiniae*, but remain constantly expanded, and are almost never completely at rest.

Of all the species, *actinia mesembryanthemum* is perhaps the most easily kept in the aquarium. It not unfrequently changes its place, and its locomotion is an interesting subject of observation. It will subsist for a considerable time without supplies of food, but readily accepts morsels of beef or mutton, fish, or almost any kind of animal food. The tentacula with which the offered food first comes in contact attach themselves to it; those next to them are in motion, as if to support them, if necessary, and a sort of sympathy seems to extend even to the most remote; but except in the case of struggling prey, or of a very large morsel, only a small number of the whole tentacula are usually employed in conveying the food into the mouth, or, more properly, into the stomach, for they do not seem to part from it till they have fairly lodged it there.

Sea-anemones are extremely voracious, and almost every observer has his own anecdotes to illustrate it. Dr. Johnston relates one which at the same time remarkably illustrates their power of reproducing organs of their own body. "I had once brought to me a specimen of *act. crassicornis*, that might have been originally 2 in. in diameter, and that had somehow contrived to swallow a valve of *pecten maximus* of the size of an ordinary saucer. The shell, fixed within the stomach, was so placed as to divide it completely into two halves, so that the body, stretched tensely over, had become thin and flattened like a pancake. All communication between the inferior portion of the stomach and the mouth was of course prevented; yet, instead of emaciating and dying of an atrophy, the animal had availed itself of what undoubtedly had been a very untoward accident, to increase its enjoyments and its chances of double fare. A new mouth, furnished with two rows of numerous tentacula, was opened up on what had been the base, and led to the under-stomach: the individual had indeed become a sort of Siamese twin, but with greater intimacy and extent in its unions. (*British Zoophytes*, i. 235.)

As inmates of the aquarium, sea-anemones are apt to prey upon their fellow-prisoners. "Simple contact of the tentacula," says Sir J. G. Dalyell, "is the prelude of destruction. Some animals, as if conscious of their inevitable fate, seem paralyzed by the touch and yield without a struggle. Others, whose size and strength should insure indemnity, are held in the relentless grasp; the tentacula crowding faster and faster around, until the victim is speedily swallowed alive." There appears to be in other marine animals an instinctive horror of the tentacula of the sea-A. The hermit-crab will instantaneously flee out of its shell, if the shell is caught by them. It is now believed that, like the *aelephæ* (q.v.) and the *hydras* (q.v.), the sea-anemones possess a power of benumbing their prey. Sea-worms (*neraeides*) have been observed first to writhe, and then to become paralyzed. Little elliptical capsules are in some species scattered over the whole surface of the body; in others, confined to the tentacula, or even to their tips. These are furnished with spicula or minute spears, by which it is probable that not only are wounds inflicted, but poison is also conveyed into them. The sensations produced by the touch of the tentacula appear to be very different in the case of different persons, from a mere "rasping feeling" on the withdrawal of the hand, to a slight tingling and even to a stinging as by a nettle. The *anthea cereus* possesses the stinging power in a much greater degree than the ordinary *actiniae*. Probably the skin of the human hand is in general too thick or hard to be pierced by their fine spicula. Dr. A. Waller of Birmingham dis-

covered that, on submitting the tip of his tongue to the tentacula, a pungent pain and stinging, as by a nettle, were the constant result. He also found that a thin Indian rubber membrane grasped by the tentacula retains the microscopic "poison darts" sticking on its surface. Some of these are only two or three times the length of the capsule which contains them, or at most 100th part of an inch; but others are much longer, and when within the capsule, are coiled up after the manner of a watch-spring. The capsules are therefore called *filiferous* or *thread capsules*. This thread is highly elastic, and the expulsion of it, as of the shorter spicula, is effected, Mr. Gosse tells us, by organs having this for their special office.

**ANEMOSCOPE**, a vane or weathercock, or any instrument which shows the direction of the wind; often with a spindle attachment that turns an index or a compass scale in a room, showing within a house the course of the wind. Latterly the A. has been made self-recording, and now in most observatories needs no watching, every movement of the wind being written down; the force or pressure and the velocity in miles per hour being also recorded. This is done by pencils which press lightly upon a cylinder covered with a sheet of paper divided into horizontal hour lines, the lines moving at the rate of half an inch an hour, a complete revolution of the cylinder occupying 24 hours. Lines marked by the pencils show by their relation to the graduated lines the direction of the wind at any moment of the day.

**AN-END**, a maritime term relating to the position of any mast or boom when perpendicular to the plane of the deck or other level from which it springs. When a top mast is in its proper place at the head of the lower mast, it is said to be "an-end."

**ANEROID** (formed in an anomalous way from Gr. *a*, priv., and *nēros*, wet), the name given to a barometer invented by M. Vidi of Paris, in which the pressure of the air is measured without the use of liquid, as in ordinary instruments. The face of the A. barometer, represented in fig. 1, has a diameter of about 5 in., and the case behind, which contains the mechanism, a general idea of which is given in fig. 2, is about 2 in. deep. The pressure of the atmosphere acts upon a circular metal box, AA, about 3 in. in diameter, and  $\frac{1}{4}$  of an inch deep, which has been nearly exhausted of air, and then soldered air-tight. The sides are corrugated in concentric rings, so as to increase their elasticity, and one of them is fixed to the back of the brass case which contains the whole. The amount of exhaustion is such that if the sides of the box were allowed to take their natural position, they would be pressed in upon each other, and to prevent this they are kept distended, to a certain extent, by a strong spring, S, fixed to the case, which acts upon the head of the stalk, B, attached to the side next the face. When the pressure of the air increases, there being little or no air inside the box to resist it, the corrugated sides are forced inwards, and when it diminishes again, their elasticity restores them to their former place; and thus the little box becomes a spring extremely sensitive to the varying pressure of the external atmosphere. Supposing the two sides pressed inwards, the end of the spring, B, will be drawn towards the back of the case, and carry with it the rod, EG, which is firmly fixed into it. EG, by the link GH, acts on the bent lever, HKL, which has its axis at K, so that, while the arm, KH, is pushed to the right, LK is moved downwards. By this motion, a watch-chain, O, attached at L, is drawn off the little drum, M, and the index-hand, PP, which is fixed to it, would move from the position represented in fig. 1 to one towards the right. When the contrary motion takes place, a hair-spring moves the drum and the hand in the opposite way. By this mechanism, a very small motion of the corrugated sides produces a large deviation of the index-hand,  $\frac{1}{100}$  of an inch causing it to turn through 3 inches. The A. barometer is graduated to represent the inches of the mercurial barometer. Both from its small size and construction, it is extremely portable, and consequently a very useful instrument; but from its liability to change from time to time, it must be frequently compared with the mercurial barometer. The "metallic barometer" of M. Bourdon is a modification of the A. principle.—See *Manual of Barometers*, by J. H. Belville.

**ANEURISM** (Gr. *aneurysma*, a dilatation) is a pulsating tumor consisting of a sac or pouch into which blood flows through an opening in an artery. The sac of an arterial A. may be formed in the first instance by one or more of the tunics of the vessel, generally the outer one, the two inner having given way. This is called a *true A.*, in contradistinction to the *false*, in which the sac is formed of cellular tissue condensed by the blood flowing into it after a wound has been inflicted on the artery from without. Should the sac give way, and the blood escape among the tissues, the A. is said to be

FIG. 1.

Aneroid barometer.

FIG. 2.

diffused. Varicose A. is when the sac communicates both with an artery and a vein; aneurismal varix, when these vessels communicate without any sac intervening; both of these are generally the results of bleeding being performed by non-professional persons. Aneurisms prove fatal by their pressure on some important part, or by bursting and allowing a sudden escape of blood. They are cured by the deposit, within the sac, of fibrin from the blood—a result the surgeon can promote by obstructing the artery above the A. by compression or by ligature; applying the latter close to the sac, if the A. is of the “false” variety, but at a distance, if it is the result of disease. Internal aneurisms are treated by those remedies which moderate the heart’s action, as digitalis, etc.

ANGARA', or UPPER and LOWER TUNGUSKA, a river of Asiatic Russia, flowing out of lake Baikal, passing Irkutsk, and joining the Yenesei, after a course of 1100 miles. The current is strong, with many rapids, and the scenery often beautiful.

ANGEIOLEUCITIS. See ADENITIS.

ANGEL, an ancient English gold coin, varying in value from 6s. 8d. to 10s. It was so called from the figure of the archangel Michael piercing the dragon upon its obverse. A. continued to be coined down to the time of the Commonwealth.

ANGEL-FISH, *Squatina angelus*, a fish common on the southern coasts of Britain, and remarkable for its extreme ugliness. On some parts of the coast, it is called *monks fish*. It is very nearly allied to the sharks, and was included by Linnæus in the genus *squalus*. See SHARK. It is very voracious, preying chiefly upon fishes. It attains a length of 7 or 8 ft.; and the body is broad and flattened horizontally. The head is nearly round, and broader than the body, from which it is separated by a very distinct neck; the mouth is extremely large, and at the extremity of the snout; the eyes are on the upper part of the head, and are very small; behind the eyes are large spout-holes; the skin is very rough, and covered with tubercles. The upper parts are of a gray color; the under parts, dirty white. The female is said to produce seven or eight young in spring and autumn.

ANGELI, FILIPPO, d. 1645; an Italian painter early in the 17th century. He excelled in landscapes, and was among the earliest to apply strict rules of perspective. His works are scarce. Two others of his name were known as painters, Giulio Cesare, 1570-1630, and Guiseppe, b. 1715.

ANGELICA, a genus of plants of the natural order *umbellifera* (q.v.), by some botanists divided into two: *A.*, and *archangelica*. The species are mostly herbaceous and perennial, natives of the temperate and colder regions of the northern hemisphere. They have bipinnate or tripinnate leaves. WILD *A.* (*A. sylvestris*) is a common plant in moist meadows, by the sides of brooks, and in woods in Britain and throughout many parts of Europe and Asia. The root is perennial, short, ringed, and branched; it is white within, and contains a yellow milky juice. The stem is hollow, 1½ to 5 ft. high, often flecked with red; the umbel is convex. GARDEN *A.*, *A. archangelica* or *archangelica officinalis*, is a biennial plant, becoming perennial when not allowed to ripen its seeds. It has greenish flowers in almost spherical umbels. The stem is as high as a man. The fruit is long and straw-colored. The root is long and fusiform, an inch or more in thickness, with thick irregular rugose radicles. The whole plant, and especially the root, is aromatic and bitter, containing much resin and essential oil. The root is admitted into the pharmacopœia as an aromatic stimulant and tonic, and is used in nervous ailments, and in indigestion and flatulence. It is very little used in Britain. The root of *A. sylvestris* is sometimes substituted for it, but is much weaker.—The garden *A.* was at one time much cultivated for the blanched stalks, which were used as celery now is; but its cultivation for this purpose has long been almost entirely discontinued. The tender stalks and midribs of the leaves, candied, are still, however, a well-known article of confectionery, and an agreeable stomachic; the roots and seeds are employed in the preparation of gin and of “bitters.” The plant is a very doubtful native of Britain, but is common in many parts of Europe, and even in Lapland and Iceland. The Laplanders not only use it as food, but regard the stalks roasted in hot ashes as an efficacious remedy in pectoral disorders.—The powdered seeds of the wild *A.* are used by the country people in some parts of Europe to kill lice. Several species of *A.* are natives of North America.

ANGELICA TREE. See ARALIA.

ANGELIC HYMN, the hymn beginning “Glory be to God on high,” so called because the first words are recorded to have been sung by the angels heralding the infant Saviour at Bethlehem.

ANGELICO, FRA. See FIESOLE, ante.

ANGELINA; a co. in e. Texas; 1059 sq.m.; pop. '70, 3985—742 colored. It is heavily timbered with a great variety of trees. Corn, cotton, sugar cane, rice, and tobacco are produced. There are steam mills, and petroleum is found. Co. seat, Homer.

ANGELL, JAMES BURRILL, LL.D., b. R. I., 1829. In Sept., 1845, he entered Brown university, and graduated four years later. In 1851 he went to Europe, where he spent

two years in study and travel. He returned to accept the chair of modern languages and literature in the university of which he was a graduate, a position which he filled for seven years. Henry B. Anthony having been elected U. S. senator, offered him the editorial charge of his newspaper, the *Providence Daily Journal*, and in 1860 prof. A. assumed that position. After six years of journalistic labor, the offer of the presidency of the university of Vermont drew him again to academic life. He declined the presidency of the university of Michigan, at Ann Arbor, when it was offered him in 1869, but subsequently accepted it in 1871. In March, 1880, he was appointed minister to China. He is the author of many articles in the *North American Review*, and other magazines.

AN'GELL, JOSEPH KINNICUT, 1794-1857; b. R. I.; a graduate of Brown university in 1813. He was a writer on law; edited a law journal in 1828-31; and was for years a reporter for the Rhode Island supreme court. He was author of a treatise on the laws of property, and at his death was engaged on a treatise on the *Law of Highways*, which was completed by Thomas Durfee. Lord Brougham praised A.'s work on *Limitation of Actions*.

AN'GELO, MICHAEL. See MICHAEL ANGELO.

AN'GELS (Gr. messengers), in Jewish and Christian theology, a class of superior spirits, represented as the immediate instruments of Divine Providence. As Scripture contains no complete and systematic account of angels, the belief of the church respecting them, except in a few points, has never been exactly defined. It has always been held that A. and human souls, notwithstanding the high origin of the latter, are distinct; only Dionysius Areopagita (q. v.) and a few modern speculators have maintained the contrary. Dionysius, in his *Hierarchia Coelestis*, divides A. into nine orders. Whether there are not spirits superior both to men and A., has been a disputed point. As to the number of A. and their names, the church in the middle ages repeatedly checked the tendency to go beyond the usually received accounts; a Romish council, in 745 A.D., mentions with reprobation the use of the unwonted names of Uriel, Raguel, Simiel, etc. The names that have all along been in most common use are Michael, Gabriel, and Raphael.

The creation of the A. was placed, by the Platonizing church-fathers, before that of the material world; others assigned it to some one of the six days. Equally various were the opinions as to the nature of the A. The second synod of Nice (787) assigned them a subtle, ethereal, or fire-like body; the scholastics, on the other hand, and the Lateran council of 1215, maintained their immateriality; while others, owing to the appearing of A., mentioned in Scripture, attributed to them the power of assuming momentarily the corporeal form. The poet Nonnus (lived in Egypt in the 5th c.) is the first to speak of angels' wings.

The belief in *guardian A.* was common both to heathen and Jews, and had been reduced to system by Philo; and the doctrine was adopted in the Christian church, and defended by Origen and others, founding on Matthew xviii. 10, and Acts xii. 15. It has been cherished by many in all ages and of all parties, but has never been decided on by the church. Some of the fathers also spoke of good and bad guardian-angels, the former of whom were always ready to prompt to good actions, and to avert evil, while the latter were equally quick in bringing about mischief, wickedness, and calamity. From the belief in the guardianship of A., and their participation in the government of the world, arose naturally the early practice of invoking and worshiping them. Many Christian teachers condemned it, appealing to Colos. ii. 18; and the council of Laodicea, 300, called it disguised idolatry. But after the council of Nice had conceded that though A. were not to receive divine worship, they might receive reverential obeisance, the practice mentioned became more and more rooted, and continues in the Greek and Roman Catholic churches to this day.

AN'GELUS DOMINI, the name of a brief prayer repeated by Roman Catholics at the sound of the Angelus bell at sunrise, noon, and sunset.

AN'GELUS SILE'SIUS (JOHANN SCHEFFLER), 1624-77; a German philosophical poet, brought up a Protestant. He was physician to the duke of Würtemberg, and became a Romanist, taking orders as a priest. His faith was peculiar, a mystical, sentimental pantheism, imbibed from the works of Tauler and Böhme. The essence of God he held to be love; and he reasoned that as God can love nothing inferior to himself, and cannot be an object of love to himself without manifesting himself in finite form or becoming man, God and man, therefore, are essentially one. His hymns are very popular in Germany.

ANGER is displeasure or vexation accompanied by a passionate desire to break out in acts or words of violence against the cause of the displeasure; which must, of course, be a sentient being, capable of feeling the infliction. Like most other emotions, it is accompanied by effects on the body, and in this case they are of a very marked kind. The arterial blood-vessels are highly excited; the pulse, during the paroxysm, is strong and hard, the face becomes red and swollen, the brow wrinkled, the eyes protrude, the whole body is put into commotion. The secretion of bile is excessive, and it seems to assume a morbid consistency. In cases of violent passion, and especially in nervous persons, this excitement of the organs soon passes to the other extreme of depression; generally

this does not take place till the A. has subsided, when there follows a period of general relaxation. The original tendency to A. differs much in individuals according to temperament; but frequent giving way to it begets a habit, and increases the natural tendency.

From the nature of A. it is easy to see that it must be—often at least—prejudicial to health. It frequently gives rise to bile-fever, inflammation of the liver, heart, or brain, or even to mania. These effects follow immediately a fit of the passion; other evil effects come on, after a time, as the consequence of repeated paroxysms—such as paralysis, jaundice, consumption, and nervous fever. The milk of a mother or nurse in a fit of passion will cause convulsions in the child that sucks; it has been known even to occasion instant death, like a strong poison.

The controlling of A. is a part of moral discipline. In a rudimentary state of society, its active exercise would seem to be a necessity; by imposing some restraint on the selfish aggressions of one individual upon another, it renders the beginnings of social co-operation and intercourse possible. This is its *use*, or, as it is sometimes called, its final cause. But the more social intercourse comes to be regulated by customs and laws, the less need is there for the vindictive expression of A. It seems an error, however, to suppose that the emotion ever will be—or that it ought to be—extirpated. Laws themselves lose their efficacy when they have not this feeling for a background; and it remains as a last resource for man, when society, as it does every now and then, resolves itself into its elements. Even in the most artificial and refined states of society, those minor moralities on which half the happiness of social intercourse depends, are imposed upon the selfish, in great measure, by that latent fund of A. which every man is known to carry about with him.

ANGERBODA, in Norse mythology, a giantess, mother of Fenrir, the monster wolf which, at the last day, is to swallow and conquer Odin, or the Sun.

ANGERMANNLAND (Swedish *Ängermanland*, pronounced Ongermanland), a former division of Sweden, now chiefly comprised in the län of Westernorrland, extends along the Gulf of Bothnia, and is watered by the river Angermann. It exhibits great variety of wild and beautiful landscape—wood, mount, stream, and lake; vying with the banks of the Rhine, the Danube, or the far-famed scenery of Switzerland. In addition, it is one of the best cultivated districts in Sweden, producing barley, rye, and peas, and abounding in excellent pasturage. The river Angermann, in its lower course, becomes navigable for the largest ships, and broadens out into a lake shortly before discharging itself into the gulf of Bothnia. The inhabitants are reckoned among the solidest of the Swedes, and are favorably known for their sobriety and industrious habits, on account of which, prosperity is general. The chief town of the district is Hernösand, with a population of rather more than 2000, standing on the small island of Hernö, and having steam communication weekly with Stockholm. It is the see of a bishop, has a cathedral-school and literary and printing establishment with Lappish type, public baths, and building docks. It exports linen fabrics, and the Baltic products generally.

ANGERMÜNDE, a t. in Prussia, capital of a circle of the same name in the province of Brandenburg, 43 m. from Berlin by railway. Pop. about 6400. The chief industry is the manufacture of woolen and linen goods.

ANGERS, the ancient *Juliomagus* or *Andegarum*, formerly the capital of the duchy of Anjou, and now of the French department of Maine-et-Loire, is situated on both sides of the navigable river Mayenne, not far from its junction with the Loire, lat. 47° 28' N., long. 0° 33' W. A. is the see of a bishop, and was the seat of a university founded in 1246; instead of which it has now an academy of the highest class. Lord Chatham and the duke of Wellington received a portion of their education at the military college which was once here, but which is now removed to Saumur. It has also given birth to two distinguished men, Bernier, the traveler, and David, the sculptor. It has also a theological seminary, an institution for the deaf and dumb, a botanical garden, a large picture-gallery, and a public library containing 40,000 volumes. The ruins of the ancient castle of A., built by St. Louis, about the middle of the 13th c., are situated on a projecting rock above the river. The cathedral of St. Martin is a fine building of the 9th c., in the Roman basilica style. Sail-making, cotton-spinning, stocking-weaving, etc., are carried on to a considerable extent, and a trade in corn, wine, brandy, flax, hemp, honey, etc. The neighboring slate quarries employ 3000 men. Pop. '76, 55,366.

ANGEYJA, in Norse mythology, one of Heimdall's nine mothers. The "Edda" says: "Nine giant maids gave birth to the gracious god at the world's margin."

ANGHIA'RI (anc. *Castrum Angulare*), a town of Central Italy, in the province of Arezzo, Tuscany, 10 m. n.e. from Arezzo, on the slope of a hill near the Sovara, one of the head-waters of the Tiber. In 1440, a battle was fought here, in which the Milanese were defeated by the Florentines. Pop. of commune, 6941.

ANGHIE'RA, PIETRO MARTIRE, D' (PETER MARTYR), 1455-1526; an Italian historian. He became a priest in Spain in 1488; in 1501 he was on a mission of state to Egypt, and in 1505 was prior of the church of Grenada. He was a member of the council of the Indies. His works are important; the *Opus Epistolarum* records almost every event of

consequence from 1488 to 1525, and *De Rebus Oceanis et Orbe Novo* is a valuable account of the new-world discoveries, taken from the lips and reports of Columbus and other early navigators.

AN'GILBERT, SAINT, secretary and friend of Charlemagne, and the most distinguished poet of his age. He filled the highest offices, and married the great monarch's daughter Bertha; he afterward retired from public service and became abbot of a monastery returning from time to time as the state required his services. In 800 he assisted in Rome at the coronation of the emperor, who called him the "Homer of the age." He died in 814.

ANGINA PECTORIS, or HEART-STROKE, is characterized by intense pain and sense of constriction, which occur in paroxysms beginning at the breast-bone, or deep in the chest, and extending towards the left shoulder. The fits recur, and the patient either dies in one of them, or from effusion of fluid within the chest.

A. P. rarely occurs before the 50th year, and is caused by some defect in the vascular or nervous supply of the heart itself; but the exact seat of the disease has not yet been ascertained, and, indeed, probably varies with the individual. The paroxysms are induced by any excess in diet, by exertion, as walking uphill or against a boisterous wind, or by mental emotions. As, during the paroxysm, but little can be done, "whoever is subject to fits of the heart-stroke, should studiously shun all occasions of having his feelings roused or his passions warmly interested. If he is prone to anger, he must either endeavor to restrain his passion, or must withdraw from scenes likely to awaken it. If he feels keenly contradiction, disappointment, or insult, he had better avoid all disputes in which he may meet either one or the other. He must lead a sober, quiet, and temperate life, in which neither the emotions of the soul are to disturb the functions of the body, nor corporeal affections are allowed to disturb the serenity of the mind."—*Cruikshank*.

ANGIOSPERMOUS (from the Gr. *angeion*, a vessel, and *sperma*, seed), a term in botany, applied to phanerogamous plants which have their seeds inclosed in a pericarp. This is the case with the greater part of phanerogamous plants. Those which have the seeds naked, as the *coniferae* (q. v.), are called *gymnospermous*. In the Linnæan system, one of the two orders of the class *didynamia* is called *angiospermia*.

ANGLE (from Lat. *angulus*, a corner) means, in geometry, the opening or inclination of two lines that cut or meet one another. If the lines are straight, the A. is *rectilinear*. The magnitude of an A. depends, not upon the length of the lines or legs, but upon the degree of their opening. If the legs are supposed closed, like a pair of compasses, and then gradually opened till they come into one straight line, they form a series of gradually increasing angles; when half-way between shut and straight, they contain a *right* A. Any A. less than a right A. is called *acute*, and one greater is called *obtuse*. Angles are measured by degrees, of which a right A. contains 90°. The A. made by two curved lines (*curvilinear*) is the same as the A. made by the tangents to the two curves at the point of intersection. Angles made by planes with one another can also be reduced to rectilinear angles. When three or more planes meet at the same point, the angular space included between them is called a *solid* A.

The FACIAL ANGLE, on which Camper founded a scheme for estimating the degrees of intellect and sagacity bestowed by nature on the several members of the animal kingdom, was measured by him in the following way: One straight line was drawn from the ear to the base of the nose, and another from the prominent center of the forehead to the most advancing part of the upper jawbone, the head being viewed in profile. "In the angle produced by these two lines," says the physiologist, "may be said to consist not only the distinction between the skulls of the several species of animals, but also those which are found to exist between different nations; and it might be concluded that nature has availed herself at the same time of this angle to mark out the diversities of the animal kingdom, and to establish a sort of scale from the inferior tribes up to the most beautiful forms which are found in the human species. Thus it will be found that the heads of birds display the smallest angle, and that it always becomes of greater extent in proportion as the animal approaches most nearly to the human figure. Thus there is one species of the ape tribe in which the head has a facial angle of 42°; in another animal of the same family, which is one of those *simia* approaching most closely to the human figure, the facial angle contains exactly 50°. Next to this is the head of the African negro, which, as well as that of the Kalmuc, forms an angle of 70°, while the angle discovered in the heads of Europeans contains 80°. On this difference of 10° in the facial angle the superior beauty of the European depends; while that high character of sublime beauty which is so striking in some works of ancient statuary—as in the head of the Apollo and in the Medusa—is given by an angle which amounts to 100°."

ANGLE, DEAD. In fortification, where an angle of the wall is so formed that a small plot of ground in front of it can neither be seen nor defended from the parapet, it is called a "dead angle." See BASTION, CURTAIN, FORTIFICATION.

ANGLER, *Lophius piscatorius*, a fish not uncommon on the British shores, and sometimes called the *fishing-frog*, sometimes, from its ugliness and voracity, the *sea-devil*.

It usually attains the size of about 3 ft. in length, sometimes 5 ft. The head is enormously large, depressed, and spinous; the mouth is of similar proportions (whence the Scottish name *wide gab*), and furnished with many sharp curved teeth. The lower jaw is considerably longer than the upper. The body is narrow in comparison with the great breadth of the head, and tapers rapidly to the tail. The whole fish is covered with a loose skin, almost without scales. There are two dorsal fins, which are spinous, and three anterior rays, regarded as belonging to the first dorsal, are free and articulated to the head, which are with great probability supposed to serve the animal as delicate organs of touch. The nostril tube is elongated into a membranous stalk, capable of spreading out like a cup at the upper end, and of being moved in every direction by a very numerous set of muscles, the bottom of the cup being divided into projecting leaflets, on which the olfactory nerve is finally distributed. There are also numerous worm-like appendages about the mouth, and by means of these, and still more of the filaments which rise from the upper part of the head, the creature is supposed to attract small fishes, upon which it seizes. The wonderful stories told upon this point seem to require authentication, yet they are in themselves by no means incredible, and have been current concerning this fish and its congeners since before the days of Aristotle, who mentions them, and says that this fish is called a *fisher* because of the means by which it procures its food. Yarrell justly remarks of the stratagem ascribed to the *lophius*, that it is not more wonderful than that of spiders, which spin and repair their webs to catch insects, upon which they subsist.—The genus *lophius* belongs to a family of acanthopterygious fishes called *lophiada* or *lophioids*, and by Cuvier *pectorales pedunculati*, remarkable for the elongation of the carpal bones, so as to form a sort of wrist, to the extremity of which the pectoral fin is articulated; so that, by means of it, these fishes are able to leap suddenly up in the water to seize prey which they observe above them; and some of them can hop about upon sea-weeds or mud from which the water has retired. They do not suffer so quickly as most other fishes from being out of the water, their gill-opening being very small, and an *A.* has been often known to devour flounders or other fish which have been caught along with it. The bones are much softer than those of acanthopterygious fishes in general.

**ANGLES** (*Angle*), a German tribe of the race of the Suevi, who seem originally to have occupied the country lying on the e. of the Elbe, between the mouths of the Saale and the Ohre, and, moving northwards, to have settled in Schleswig, between the Jutes and the Saxons. Along with the latter the *A.* passed over in great numbers to Britain, during the 5th c., and ultimately established there the Anglo-Saxon (q.v.) kingdoms of the heptarchy. From them England derives its name (Lat. *Anglia*, Anglo-Saxon *Engla-land*). After these migrations from Schleswig, the Danes from the north entered the deserted districts, and mingled with the *A.* who remained there. The German language and manners were afterwards introduced by immigrant nobles from Holstein, and prevailed among the higher classes; but to the time of Christian VI., the Danish was still generally spoken by the common people. During the present century, the German has more completely gained the ascendancy. The modern Angles are of a more passive disposition than the Frieslanders and the people of the Dithmarsch, and religious sentiment is very strongly manifested among them. The district called *Angeln* extends from the Schlei on the s., to the Flensburg hills on the n., contains about 830 sq. m., and a pop. of about 50,000. The name has no political or administrative signification.

**ANGLESEA, ARTHUR ANNESLEY**, Earl of, 1614–86; lord privy seal in the reign of Charles II. He was educated at Oxford, and studied law at Lincoln's inn. He was sent as commissioner to Ulster in 1645 to oppose the designs of the rebel Owen Roe O'Neill. After the death of Cromwell he was president of the council of state, and concerned in bringing about the restoration. He succeeded to his father's titles in 1640. *A.* was a man of great abilities and extensive learning, well acquainted with the constitution and the laws of England, and the author of several works of a political and polemical character.

**ANGLESEA, HENRY WILLIAM PAGET**, earl of Uxbridge and marquis of *A.*, b. May 17, 1768, was educated in Oxford, and, as lord Paget, entered the army at the beginning of the French revolution. From 1793 to 1794 he commanded a volunteer corps in Flanders, and subsequently acquired a high reputation as a cavalry officer in the peninsular war, especially during the retreat under gen. Moore. At the battle of Waterloo, where he commanded the British cavalry, he lost a leg. On his return to England, he received a vote of thanks from parliament, and was made marquis of *A.* Afterwards, he took a part in the administration under Canning, and in 1828 was appointed lord-lieutenant of Ireland, at a period when that country was greatly agitated on the question of its religious privileges. He at first opposed the emancipation of the Catholics; but ultimately became convinced that it was essential to the peace of the country, in consequence of which he was recalled from Ireland by Wellington in 1829. He was again appointed to the same office under lord Grey's administration in 1831; but the perverse policy of the tories had involved matters in such perplexity that even the decisiveness and integrity of his character could not allay the irritation. O'Connell had now commenced his ruinous career of agitation, and the marquis was compelled to resort to severe coercive measures, which destroyed the popularity he had previously acquired.

His rule in Ireland was not characterized by any superior statesmanship; but it ought to be remembered, to his honor, that he founded the Irish board of education, which has been of immense service to that nation. In 1833, he was succeeded by the marquis of Normandy; but did not again take any prominent part in public proceedings till 1846, when he accepted the office of master-general of the ordnance in lord John Russell's ministry. In the same year he was raised to the dignity of field-marshal. He d. on the 29th April, 1854.

**ANGLESEY**, or **ANGLESEA** (Sax. *Angles' Ey*, i.e., "the Englishmen's island"), an island and co. of Wales, on the n.w. coast of that principality, being separated from the mainland by the Menai strait. Its form is that of an irregular triangle, the base facing the mainland. Its length is about 20 m.; breadth, about 17; coast-line, about 80; area, 193,511 acres. Pop. '71, 51,040. The climate is mild, but foggy, especially in autumn; the soil generally a stiff loam, varying with sandy and peaty earth; the general aspect of the island flat and uninteresting, there being very little wood. The prevailing rock is mica schist; limestone ranges traverse the country; granite, marble, coal, serpentine soapstone, are also found. The island is rich in minerals; the Parys and Mona copper-mines, near Amlwch, were opened in 1768. Lead ore, containing much silver, has also been found. The manufactures of A. are inconsiderable. Agriculture, though still rather backward, has yet in recent years made considerable advance in the way of adopting means of improvement. Increased attention has also been given to the breeding of cattle and sheep. The number of acres under all kinds of crops, bare fallow, and grass, in 1875, was 145,715; under corn crops, 29,048; under green crops, 10,805. The number of horses used for agricultural purposes was 6467; of cattle, the number was 40,987; of sheep, 54,106; and of pigs, 15,151. Communication with the mainland is by the Menai suspension bridge, and the great Britannia tubular bridge, over which the Chester and Holyhead railway passes. See **TUBULAR BRIDGES**. A. was known to the Romans under the name of *Mona*. It was one of the chief seats of the Druidical power, which in 61 A.D. was all but destroyed by the Roman general, Suetonius Paulinus. The island was again subdued by Agricola, 76 A.D. Egbert conquered it in the 9th c.; but the native princes afterwards recovered their dominion, establishing the seat of government at Aberffraw. It was finally subdued by Edward I. The ancient remains consist chiefly of dolmens, two of which, side by side, are in the park of Plas, Newydd, the seat of the marquis of A. At Holyhead are the remains of a Roman camp.

The climate of A. is milder than that of the mainland of Wales; but in the autumn the air is frequently filled with noxious mists. The co. is divided into three districts, called *cantref*s, each subdivided into two *commote*s. The market-towns are Amlwch (a flourishing little seaport of 2968 inhabitants), Beaumaris (q.v.), Holyhead (q.v.), Llangefni (pop. 1222), and Llanerch-y-medd. The first four of these towns unite in returning one member to the imperial parliament; the co. returns another.

**ANGLING** is the art of alluring and capturing fish by means of a rod, line, and hook—the hook being furnished with a lure, which is either some object on which the animals naturally prey, or is a counterfeit of such an object. A. is of great antiquity, as we learn from mention being made of it by the prophet Isaiah: "The fishers also shall mourn, and all they that cast angle into the brooks," chap. xix., v. 8. The practice has continued through all ages, till the present time, and in almost all countries. In 1496, Wynken de Worde "emprinted at Westmestre" a "*Treatise of Fysshinge with an Angle*," by Dame Juliana Berners or Barnes. Izaak Walton, in 1653, gave to the world his *Complete Angler*, a work afterwards enriched with additions by his friend Charles Cotton, and till this day esteemed both for correctness of details and the singularly happy humor of its apologies, poetical pieces, and disquisitions.

We reserve for future articles the habits and best methods of capturing the principal species of fish that haunt the streams and lochs of Great Britain, and here confine ourselves to a short notice of A. apparatus, and some general directions, etc., for the guidance of tyros, proceeding at once to describe, first:

**FISHING-TACKLE**.—The angler's equipment consists of *rod* and *reel*, *lines*, *hooks*, *baits*, *hair-flies*, *tackle-box*, and *basket*; these should be as simple as possible in their construction, many accessories added by the fishing-tackle maker being more ornamental and cumbersome than really useful.

The *rod* must be long or short, stiff or supple, to suit the habits of different species of fish; thus, a long rod of 16 or 18 ft., very strong, but not very elastic, is necessary for salmon; while a rod of 10 to 14 ft., light, elastic, and finely tapering, is sufficient for trout. The rod for trout and similar kinds of fishing should be light enough to be wielded easily for several hours together by one hand. Spliced rods are easier mended than those with joints, and do not so readily get out of order. For salmon and other kinds of large fish, a large rod of several pieces, united by joints, is necessary.

The *reel* or *pirn*—an apparatus fixed near the bottom of the rod, and upon which the line is wound—should be simple in its mechanism, and made so as to wind or unwind freely and quickly.

*Lines* should be long, smooth, and flexible, and of a material not easily injured by wet. The part of the line which is wound upon the reel, and passes along the rod, is called the *reel-line*; that which is attached to it, is called the *casting-line*. The casting-

line is usually made of triple gut, twisted, and between it and the gut to which the oads are attached, there should be several threads of strong single gut. Reel-lines vary from 20 to 120 yds. in length, according to the dimensions of the water to be fished, and the habits of the species to be captured. Lines are made of various materials, such as horse-hair and oiled silk. If, in purchasing, the angler be at a loss to decide between a heavy or a light line, he should incline rather to the heavy, for the sake of its casting superiority, and the advantage gained in windy weather. The casting-line is sometimes made of horsehair, lighter and finer than the reel-line, and at the end of this is attached the gut-line—the finest of all. Sometimes, however, the horsehair casting-line is dispensed with. The casting and gut lines should taper in thickness from the reel-line to the end hook on the gut-line; all knots should be small, but secure, the only breaks discernible, by a general glance throughout the entire length of casting and gut lines, being the hooks.

*Hooks* range in size from several inches down to a quarter of an in. in length. Their chief places of manufacture are Kendal and Redditch.

*Baits* consist of any substance put upon a hook to act as a lure to the fish; and when used, the baited hook is dropped into and allowed to sink in the water, instead of being kept near the surface, as is the case with fly. The materials, living or dead, used for bait are very numerous, the principal kinds being worms, caddis-worms, pastes, maggots, minnows, artificial and natural, and various kinds of insects. The methods of using baits are extremely various, and in many cases rather complicated.

*Artificial flies*, intended as they are to bear something like a resemblance to the actual live flies, are the most important lures used by the angler. The chief materials for dressing flies are cocks' hackles or other feathers, to form wings; the fur of a hare's ear, mouse, water-rat, or some other animal, to form the body; and waxed silk thread to tie the whole, in an artful, neat manner, to the shank of the hook.

The following is a list of trout-flies and spiders, with a supply of which the angler may pursue his "meditative art" in almost any river or stream in Great Britain throughout the entire season. Spiders are dressed, as they naturally exist, without wings.

*Flies*.—No. 1. Wings formed of feathers from the wing of the chaffinch, with a black hackle, tied with slate-colored silk.

2. Wings composed of woodcock or partridge feathers, and red hackle, tied with yellow silk.

3. Wings formed of the feathers of the corn bunting, with a red hackle wound round close to the head, tied with orange-colored silk.

4. Wings formed from the speckled feather of the teal, with a black hackle wound round close to the head, tied with brown silk. The same wing with a red hackle, tied with yellow silk, also makes a killing fly.

5. Wings from the feathers of the dotterel; body and hackle same as No. 2.

6. Wings from woodcock or corn bunting wing; body of hare's ear.

*Spiders*.—1. From the small feather of the dotterel wing, tied with yellow silk thread.

2. From the small glistening feather taken from the outside of the shoulder of the starling's wing, tied with yellow silk thread.

3. From the neck-feathers of the hill-partridge, tied with yellow silk thread.

4. From the black hen-hackle, tied with small black silk thread.

5. From the blue hen-hackle, tied with yellow silk thread.

6. From a small red cock-hackle, or the small feather of the landrail's wing, tied with yellow silk.

Of *salmon-flies*, the best two we know of are formed from the following materials:

"No. 1. Tail—crest-feather from golden pheasant; tip—gold tinsel and orange silk, with two turns of ostrich herl; body composed of claret-colored pigs' wool and mohair mixed, with a little pigs' wool at the head, of a light-blue shade; wound with silver tinsel and dark-red hackle, with blue jay's feather for shoulders; wings—from the teal-duck or widgeon, distinctly marked or barred; head—of black ostrich herl.

"No. 2. Tail—crest feather from golden pheasant; body composed of pigs' wool and mohair mixed, of a dark-cinnamon shade; wound with silver twist and dark-red hackle; shoulders composed of breast-feather of the argus pheasant; wings composed of golden pheasant tippet or neck feathers, distinctly marked teal, four fibers of blue and red macaw tail-feathers, with pairs of wings from the brown and black barred feathers of the peacock wing surmounting the whole; a blue feather from the kingfisher or blue chat-terer on each side of the wings; feelers—from blue and buff macaw tail-feathers; head—black ostrich herl."

Larger and more gaudily dressed hooks are necessary for some of the bigger rivers of Great Britain, such as the Shannon in Ireland, and the Tay in Scotland; but the two here described are the most killing varieties for general use that we know of, and have been found more or less serviceable in every salmon river of any importance. No. 1 may be varied by different shades of wing, to suit various colors and sizes of water. Both are stock-flies with every tackle-maker.

The angler's equipment is completed by the addition of a basket or bag for holding his fish, and a tackle-book; also a flat, round tin box for holding his fly-casts. In fishing for perch, gudgeons, bream, etc., a small float is often used. Floats are made of cork, quill, reed, and other light materials; and a choice, according to circumstances, may be

added to the tackle-book. Books adapted for the angler's purpose can be had of any tackle-maker.

The angler's dress should be a plain, dull-colored suit; his shoes strong; and if he prefers wading, his boots or leggings should be waterproof.

The *gaff* and *landing-net* are each useful for securing large fish when stranded in very shallow water, or when fishing from a boat; and the *drag-hook*, which is an instrument with three bent prongs or hooks, with a long strong line attached, is frequently useful for casting into rivers or lochs to clear away any object at the bottom on which the hook has fouled.

**PRACTICE OF ANGLING.—Bait-fishing.**—As a rule, bait-fishing is practiced more on sluggish, deep rivers than on swift-running streams, though it answers as well, and, under certain circumstances, even better in the latter than in the former. The fish usually sought for in the slow-running, deep rivers south of the Tweed, are gudgeon, roach, dace, bream, chub, barbel, tench, carp, perch, pike, trout, etc. All are sometimes taken with fly; but worms, gentles, or paste are more generally used.

The first thing the bait-fisher has to learn, is the art of baiting his hooks. Taking the hook in his right hand, and the bait between his fingers in the left, let him enter the hook at the head of the worm, and carry it through the animal to near the tail, covering the entire hook and its tying. The worm should be broken or mangled as little as possible; and the more life-like it appears, the greater the probability of its proving an effectual lure. There must not, however, be too much spare worm left dangling from the hook, otherwise the fish will keep nibbling it away without biting at the bait bodily, and taking it into its mouth—the thing which the angler desires.

In throwing the line with bait, take care not to splash the water, but throw forward and upward, so as to let the bait fall gently on the surface, and sink slowly in the water to the required depth. The motion of the line down the stream must then be carefully followed and watched.

Occasionally the angler will *feel* a nibble, but he must not be in a hurry to *strike*—that is, to fix the hook in the fish's mouth. Perhaps it is no more than a nibble, and it is well to allow the fish time to bolt the hook. If drawn too quickly, you may actually pull away the hook after it is half gulped. Experience and dexterity are required in this ticklish part of the craft.

In May, the creeper, or stone-fly in its embryo state, is a deadly bait; and in June, when it assumes the winged state, it is the most killing bait that can be used. The creepers are mostly found under large stones in the water, and flies under large stones in the dry channel at the edge of the water. On Tweedside this fly is frequently but erroneously called the May-fly, and is productive of large takes of trout when other lures are comparatively useless. Minnows and parr-tail are two important baits; tackle is made on purpose for these, and consists of several hooks tied within an inch or so of each other. These are inserted in the minnow, so as to give a curving form to the bait, for the purpose of making it *spin* in the water; swivels are attached to the tackle further up, to prevent the line from twisting with the spinning of the minnow. Stoddart says: "Fish in rapid streams, also in deep discolored pools, and during a smart curl. Manage the minnow as you would your fly, throwing it down and across as far as you are able; bring it towards you about six inches below the surface, spinning rapidly by the aid of several swivels. When a fish rises, give him time before you strike; let him turn and gorge the bait, then strike sharply, and he is yours." This mode of fishing requires more dexterity and practice than ordinary bait-fishing, and will be best learned by carefully watching the motions of an experienced hand.

**Fly-fishing.**—This is the true *A.*, all other kinds being tame in comparison. Trout and salmon are the fly-fisher's chief objects of desire; and here we will quote some remarks of Mr. Stoddart's upon the method of capturing the former of these fish with the lure in question: "Your rod and tackle being ready, the wind in your favor down the river, draw out with your left hand a few yards of line from your reel, dip the top of your rod in the water, and with a rapid jerk you will lengthen as you wish that part you intend for throwing. A 13-foot wand will cast from 6 to 7 fathoms of line. With a large double-handed rod you may manage a much greater length. Always, if you can, angle from a distance. Trout see you when you least imagine, and skulk off without your notice.

"All jerks, in casting, are apt to whip off your hooks or crack your gut. A fly-fisher may use two, three, or four flies on his casts, according to pleasure. When angling with small hooks, we adopt the medium number. Large ones ought to be fished with in pairs, and well separated. In throwing the cast, the lowermost or trail-fly should be made to alight foremost; its fall ought to be almost imperceptible; it should come down on the water like a gossamer followed by the droppers. The moment a fly touches the surface, it is ten times more apt to raise a fish than during the act of drawing it along. At no time are we stanch advocates for the system of leading our hooks either against or across a stream; our method is rather to shake them over it for a moment, and then repeat the throw. A trout will discover your fly at the distance of several yards, if feeding, and will dart at it like lightning.

"Trout will sometimes take in the most unlikely weathers, so that the angler should not despair at any time. Hunger causes them to feed at least once in the twenty-four

hours, and generally much oftener. If the wind blows down the river, commence at the pool-head, and fish every inch of good water; you may pass over the very rough and very shallow parts, also those which are absolutely dead calm and clear, unless you see fish rising in them, when, should your tackle be light, there is no harm in taking a throw or two. Dead water, however, when rippled or discolored, may be angled in with great success."

The following remarks and hints apply chiefly to trout-fishing in streams, and may be found of service to those who follow that delightful recreation. As a rule, fish up, especially when the water is clear, and the wind not directly down-stream: the advantages are, that the fish do not so readily detect the presence of the angler—their heads being directed up the water; they are more easily hooked; and when a large trout is hooked, he may be landed down-stream, thus saving the water above for further operations. The practice of angling up-stream is somewhat difficult at first, but a little practice works wonders, and is sure to bring its reward ultimately. Gut should be round, clear, strong, and fine; the finer it is, consistent with strength, the better, as it scares fewer fish than coarser material. Trout-flies for ordinary use in rivers such as Tweed, etc., should be dressed rather sparsely, and should be small; some half-dozen varieties, such as those already enumerated, will be found amply sufficient; and were we asked to choose three kinds as being more valuable than any others, our choice would incline to a red-hackle, a black-hackle, and a woodcock-wing dressed with hare-ear body. For turbid or dark water, however, the size may be increased, and the dressing be made rather gaudier by the addition of tinsel. Practice casting till you can throw your flies like gossamer on the water, and, above all, avoid splashing. The use of a short line will give you great advantage over your tackle. Heavy fish hook themselves in nine out of ten cases, so that striking is unnecessary; striking is performed by a motion of the wrist, not of the arm, and is only to be learned by practice; it then comes quite naturally to the angler. Cast frequently; you get over more ground, and vastly increase your chances of success. Trout generally seize the fly the instant it lights on the water, or the instant after; hence, it is necessary that the angler be on the *qui vive* in time. Cast above where fish are likely to lie, and remember that the greater part of your success lies in the art of *keeping out of their sight*. Dull-colored clothes materially assist in achieving this important desideratum.

When fishing with a friend, always come to a distinct agreement, before starting, relative to the division of the water, especially if the stream be small.

The true angler returns all smoults, parr, and small trout to their native element—his maxim being quality, not quantity. He also keeps his rod well varnished, dries his line and tackle after using, and looks into his tackle-book at least once every three months during the non-A. season: he thus saves his flies from the ravages of the moth. The tyro should always be guided in his selection of a rod and tackle by some experienced friend; and upon arriving at strange angling quarters, he should place himself in the hands of a resident fisherman, who will guide him to the best casts of the river, loch, or stream. A day spent in watching the proceedings of an expert angler, is a day well spent; and a few hours' lessons in fly-busking, knot-tying, etc., work wonders. And, lastly, let the angler practice courtesy towards all his brethren of the rod, and be ever willing to lend a killing-fly to a needy friend.

The principal works on A. are Izaak Walton, Stoddart's *Angler's Companion*, the article A. in the *Encyclopædia Britannica*, Davy's *Salmonia*, the angling section of Colquhoun's *Moor and the Loch*, Dryden's *Hints to Anglers*, the angling section in Stonehenge's *British Rural Sports*, Francis's *Book on Angling*, and Stewart's *Practical Angler*. The angler will also find many useful hints in the number on A. in *Chambers's Information for the People*.

**ANGLO-CATHOLIC CHURCH**, or **ANGLICAN CHURCH**, a term frequently employed to designate collectively those churches which embrace the principles of the English reformation. The following are, in brief, the views generally entertained of those principles by the members of the churches in question: By referring the Anglo-Catholic church to the English reformation, it is not meant that her origin dates from that event, but that her tenets, as she now exists, are those which the reformation cleared of what she holds to be corruptions. For, as the word "church" itself suggests—being derived, like "kirk" in Scotland, from the Greek adjective *kuriakē*, which means "*the Lord's*" (i.e., *house*)—the origin of the Anglican church is to be traced not to a Roman but to an eastern source. She claims the name of Catholic—which also is from the Greek *katholikē*, universal—because she is united, in origin, in doctrine, and in form of government, with the universal church as it has existed, with various differences of rites and ceremonies, in all countries and in all ages. Eusebius even asserts that some of the apostles passed over into Britain. Tertullian, who lived in the 2d c., speaks of places in Britain which, though inaccessible to the Romans, were subject to Christ: "*Britannorum inaccessibleis Romanis loca, Christo vero subdita.*" At the Council of Arles, 314 A.D., there were three British bishops present; and St. Alban suffered martyrdom, under Diocletian, about the close of the 3d c., or nearly three centuries before the landing of St. Augustine (q.v.) and his missionaries, 596 A.D. Christianity, however, was driven by the heathen Saxons into the mountainous districts of Wales; and though Augustine, on his

arrival, found no less than seven bishops and one archbishop in those parts, and though Bertha, queen of Ethelbert, was a Christian, yet the whole Saxon part of the country was in a state of heathenism. The British church differed from the Roman and other western churches, as to the form of administering baptism, and the time of keeping the festival of Easter (see EASTER), following the customs of the Greek or eastern church; and it was not until the close of the 7th c., under Theodore, that the two churches became united. In the meantime, the conversion of Britain was as much due to the labors of St. Aidan, the Scottish bishop of Lindisfern, in the north, and of St. Chad, the Saxon saint, as to the missionaries of the Roman church in the south. See ANGLO-SAXONS.

Nor is this glance at the history of the Anglican church, in the earlier period of her existence, unimportant, when we come to consider what and whence are her present form and tenets. From the beginning of the 8th to the middle of the 16th c., she became gradually, and at last completely, assimilated in doctrine and practice to the church of Rome, as well as subject to her domination; and the fact of her having at length freed herself from both, is in no small degree due to her having existed, in Saxon times, in a state of freedom and purity. It required, as we have seen, a struggle of nearly a century to make the British church conform to the Roman in the matters of baptism and Easter; and it was the same spirit which offered a strenuous, and for some time an effectual, resistance to the peculiar doctrines of the church of Rome and the claims of papal dominion. There were always found individuals, some of great eminence, to protest against the former, whilst large sections of the church never ceased to protest against the latter. For a hundred and fifty years previous to the reformation, the doctrines of Wickliffe were leavening the body of the Anglican church. The overthrow of the papal supremacy was indeed effected by Henry VIII.; but that monarch rather hindered than favored the reformation of doctrine, as appeared from the rapid progress which it made when Edward VI. came to the throne. The bloody reign of Mary interposed a check to further progress; and it was not till the accession of queen Elizabeth that the principles of the reformation finally triumphed, and the Anglo-Catholic church assumed the form in which she has since continued to exist. During the period of more than 800 years preceding the reformation, she became gradually, and at length completely, merged in the Roman Catholic; at the reformation, she may be said to have emerged; when Rome, at the Council of Trent, anathematized all who would not receive her articles, the separation became final, and the positions of the two churches with respect to each other irreconcilably hostile.

The doctrines of the Anglican church are to be found in the *Book of Common Prayer* (q.v.), which is based upon the second prayer-book of Edward VI., and was settled in its present form 1662 A.D. Her tenets are more *legally* defined in the thirty-nine articles, which were settled 1562 A.D. (see ARTICLES, THIRTY-NINE). As distinguished from Rome, she rejects tradition as a rule of faith, though admitting it as to rites and ceremonies, and bases all her teaching upon the books of the Old and New Testaments, rejecting from them as apocryphal certain which Rome receives as canonical. She recognizes only two sacraments, baptism and the Lord's supper, whereas Rome allows five others—namely, confirmation, orders, penance, matrimony, and extreme unction; she denies the doctrines of transubstantiation and the propitiary sacrifice of the mass; she forbids what Rome practices—the adoration of the Virgin, saints, and angels, and the reverence of relics and images; she also denies the Roman doctrines of purgatory and the spiritual supremacy of the pope. It is not, however, to be forgotten that a great part of her liturgy is derived from the missals of the Roman church. As distinguished from the Presbyterian churches—e.g., that of Scotland—she is episcopal, and holds the unbroken succession of her orders from the apostles, as one of her most esteemed privileges; whereas the Presbyterians, especially in Scotland, reject prelacy as a remnant of popery. These do not, however, differ from her materially in essential matters of faith, but chiefly as to the sacraments, form of administering them, and the grace conveyed in them; as to the observance of seasons, such as Christmas, Lent, Easter; and as to the forms of public worship, the Presbyterians using no set forms. Her differences with the Greek Catholics are less wide than with the Roman, and will be best seen by referring to the article GREEK CHURCH. From the Lutherans she differs on the doctrines of consubstantiation in the sacrament of the Lord's supper. From the Calvinists she differs radically as to the extent of the efficacy of Christ's death, they believing only in "particular," she in "universal," redemption (meaning, of course, not that all men will be actually saved, but that Christ died for all); nevertheless, some of her articles, as the 17th, are decidedly Calvinistic. The numerous sects of Wesleyans, Baptists, and Independents do not differ from her on what they themselves consider essential articles of faith, but chiefly as to the necessity of orders, the grace conveyed in the sacraments, and the forms of public worship and of church government. But since their separation from her, endless varieties of doctrine and worship have spread among them. Unfortunately, there remains no Gallo-Catholic church with which to compare her.

The Anglo-Catholic church embraces the church of England, the Protestant Episcopal church in Ireland, the Episcopal church in Scotland, all the colonial and the American Episcopal churches. All but the latter use the English *Book of Common Prayer*; in America this has been slightly altered. The American church is one of the most flour-

ishing offshoots of the Anglican. It was planted in Virginia, 1607 A.D., but for nearly two centuries the mother church in England withheld from her offspring the necessary boon of an episcopacy of her own. It was not till the close of the 18th century that the first three American bishops were ordained (one by the Scottish bishops in 1784, and two by the archbishop of Canterbury and the bishops of Bath and Peterborough in 1787); but now this branch of Anglo-Catholicism has spread over the greater part of the United States.

**ANGLOMANIA** designates, among the French and Germans, a weak imitation of English manners, customs, etc., or an indiscriminate admiration of English institutions. In German literature, an A. was especially prevalent in the 18th c., when translations of English books became numerous, and were read with great admiration. The Germans have ascribed the sentimental and affected style of some parts of their literature to the influence of the English literature of last century. But the A. was harmless in comparison with the **GALLOMANIA**, or imitation of French literature and customs, which prevailed in the time of Frederick II. of Prussia, and was developed in the writings of Wieland. A remarkable A. prevailed in France for some time before the commencement of the revolution. It arose out of political considerations and admiration of English free institutions, but extended to trifles even of fashions and manners, and often became very ridiculous.

**ANGLO-SAXON LANGUAGE AND LITERATURE.** The term Anglo-Saxon is of quite modern origin, the ruling race in England before the Norman conquest not knowing itself by any other name than *Englisc* or English. Mr. Freeman, prof. Stubbs, and other able scholars of the present day, argue stoutly for a return to the old and true name; and to all appearance the abolition of "Anglo-Saxon" and the restoration of "English" is only a question of time. English is one of the Low German family of Teutonic languages. We do not know it in its earliest form. Some centuries elapse after the invasions of the 5th c., before any literature was produced or recorded. During this time, the dialectic differences of the various Low German tribes who had come into the island were probably diminishing, while separation from their kinsmen on the continent must on the other hand have tended to develop new peculiarities. The result is that the very oldest English is by no means the same as the very oldest dialects of Low German in the coast regions between the Rhine and the Baltic. But it most nearly resembles the old Saxon of Rhenish Prussia and Westphalia, and the old Dutch and the old Frisian of the provinces of Holland, and to the last of these it has the closest affinity. It is not to be supposed, however, that at any time before 1066, Englishmen spoke or even wrote a single dialect. There is evidence of at least two being used—a northern and a southern—an Anglian by the people of Northumbria, and a Saxon by the people of Wessex. The former is the more primitive, and as Mr. Kington-Oliphant points out (*Sources of Standard English*, 1873, pp. 35-40), has more in common with old Norse and Frisian than its southern sister; e.g., the infinitive ends not in the *an* of Wessex English, but in *a*. The history of England during the 600 years before the Norman conquest accounts both for the antiquity of the Northumbrian literature and for the subsequent triumph of the Wessex dialect. In the 7th and 8th centuries, Northumbria was the strongest, the most civilized, and the most learned of the English states. Christianity had poured its benign influences over it in double measure. Paulinus and Aidan, Rome and Iona, had both striven successfully against paganism, and light flowed over the land. Cadmon and Bede and Alcuin were all Northumbrians. That so little of this Northumbrian literature has come down to us is owing to the destruction of the northern monasteries by the Danes. The influence of Alfred, "king of the west-Saxons," and the unification of government in the island under his successors, gave the dialect of Wessex an irresistible supremacy; so much so, that even most of the early northern literature only survives in a southern dress—e.g., we can only read Cadmon in a Wessex version of the 10th century. Yet so strong was the impression left on its neighbor by the Anglian state, that not even the havoc made by the Danes of its literary monuments and its political prosperity could prevent its name from being given to the island, the people, and the tongue.

Wessex English, then—that is, the English of the court, of books, and probably in great measure of the schools—prevailed in England for more than 150 years before the Norman conquest, and is substantially what we mean when we speak of the "Anglo-Saxon" language. There is no reason to suppose that it ever superseded the dialect of the north for ordinary purposes of intercourse. Anglian lived on in the mouths of the people, and in later times has won an immortal fame in literature under the name of lowland Scotch. Cadmon and Burns both used it, though in the unapproachable verse of the Ayrshire bard it has become utterly inorganic, and so remains. English, then, before the conquest, differs from modern English in being an inflected language. Its inflections are not so rich, or various, or euphonious as those of Latin, or Greek, or Mæso-Gothic, that oldest and noblest of the Low German dialects; but they are still sufficient to give it a distinct character, and to make it strange and almost unintelligible at first sight to one whose reading does not go back beyond Shakespeare. Its nouns can be grouped into declensions, and classified according to gender, and faint traces of the

terminations are preserved in the English of the present day. The *en* in "children" and "oxen" is the old *an* of the plural in nouns of the first declension; the *s* and *es*, the old *as* marking the plural of masculines of the third. Adjectives have both a definite and indefinite form. The article is as complete as in Greek, though everything has now vanished but a fragment of the neuter *that* (modern *the*). Some mutilated remains of the pronominal inflections still survive to puzzle school-boys, and delight the lovers of "hoar antiquity." Verbs are divided into "strong" and "weak" conjugations, as is still the case in German. The distinction between the indicative and subjunctive moods, though slight, is real; and we have not only an infinitive in *an*, but a gerund in *enne*, while the present participle in *ende* is not confused with the verbal noun in *ung*, as is unhappily the case with us who have made *ing* do duty for both. Of late years the study of the English tongue, particularly in its earliest stage, has become almost popular, and grammatical works are now numerous. Besides the fragmentary or discursive contributions to the subject of English grammar by Guest, Madden, Garnet, Grimm, Earle, Morris, Kingston-Oliphant, we may specify Rask's *Angelsäksisk Sproglaere* (Stockh., 1817, with Thorpe's translation of 1865); Marsh's *Lectures on the English Language* (1861); Koch's *Historische Grammatik der Englische Sprache* (1863-69); Mätzner's *Englische Grammatik* (1865); Latham's *English Language* (1855); March's *Comparative Grammar of the Anglo-Saxon Language* (1870); and Sweet's *Anglo-Saxon Reader* (1877).

Having thus indicated very briefly some of the salient features of English as it was spoken and written before the conquest, we proceed to make a rapid survey of the contemporary literature. From what has been said above, one will naturally look to the north for the earliest examples. The *Runes* graven upon the Ruthwell cross, which was set up about 680 A.D., are now proved from the inscription itself to be the composition of Cadmon, and are the very oldest relic of Anglian poetry. Here we find Cadmon speaking his own speech, not, as in his other poems, speaking to us through a Wessex version. Other and later monuments of Northumbrian English are a *Psalter* (800 A.D.); the *Rushworth Gospels* (900 A.D.); the *Lindisfarne Gospels* (970 A.D.). But the great body of this early literature, whether produced in Northumbria, or Mercia, or Wessex, has come down to us only in the dialect of the last of these states; therefore, in referring to it, we shall consider, not the antiquity of the ms., but of the author. A good deal of it is poetical. The verse is alliterative, as in the Norse and oldest German poetry; and only in some of the later poems do we find a beginning of rhyme. The epic or narrative poems are remarkable for superabundance of often-recurring epithets, bold metaphors, and a certain pomp and magnificence of style. Of the genuine heroic poetry, however, there are few remains, the principal one being the poem of *Beowulf* (q.v.), a work which must have been composed before the Angles and Saxons quitted their original seats on the continent. Other pieces produced in Germany, though only surviving in an English form, are the *Traveler's Song* and the *Battle of Pinsburgh*. The introduction of Christianity gave a religious character to Anglo-Saxon poetry; and many narrative poems are extant on religious subjects, some of which may be seen in the *Codex Oxoniensis*, a collection edited by Thorpe (London, 1842). The *Song of Cadmon* (see CÆDMON), which is preserved in Alfred's translation of Bede, has been edited both by Junius and Thorpe; and a metrical paraphrase of parts of the Holy Scriptures, ascribed to the same author, has found editors both in Thorpe (London, 1832) and Bouterwek (vol. i., Elberfeld, 1847). Cadmon is said by Bede to have d. about 680, so that both of the works in question must belong to the 7th century. Two poems from the *Codex* which Dr. Blum discovered at Vercelli in 1832, have been edited by Jacob Grimm (Cassel, 1840), under the title of *Andreas und Elene*; a poetical calendar of the saints by Fox (London, 1830); and a version of the Psalms by Thorpe (London, 1835). Among the most important prose works must be mentioned the laws, civil and ecclesiastical, from the time of Ethelbert of Kent to that of Canute, of which the best edition is in Thorpe's *Ancient Laws and Institutes of England* (London, 1840). Of historical works may be mentioned Alfred's translations of Orosius and Bede; and the *Chronicle* carried on by different hands to 1154, of which the best edition, down at least to the conquest, is Price's, in the *Monumenta Historica Britannica*, 1848, an earlier one being that of Ingram (London, 1823). It is in the province of theology that English literature before the conquest is most rich, abounding particularly in legends and homilies. A collection of homilies made by bishop Ælfric has been published by the Ælfric society (2 vols., London, 1847), a society instituted in 1843 for the promotion of the knowledge of the England and English language of those times. Ælfric did much to enrich it with translations, and began a translation of the Bible. He translated the first seven books, the book of Job, and the apocryphal gospel of Nicodemus, and also a fragment of a poem on the history of Judith, of great celebrity (Oxford, 1698). The *Durham Book*, or St. Cuthbert's book, a very famous manuscript, now in the British museum, contains an interlinear gloss of the gospels in the East Anglian dialect, the text being probably of the 8th, and the gloss of the 10th century. Alfred translated the work of Boethius, *De Consolatione Philosophia*. The opinions of Englishmen before the conquest on astronomy, natural philosophy, and medicine are exhibited from their works by Wright in his *Treatises on Sciences written during the Middle Ages* (London, 1841), and Turner's *History of the Anglo-Saxons* (3 vols., 7th ed., 1852). Compare also Thorpe's *Analecta Anglo-Saxonica*; Marsh's *Origin and History of*

*the English Language and the Early Literature it embodies* (1862); and Grein's *Bibliothek der Angelsächsischen Poesie* (1857-61), and his *Bibl. d. Angels. Prosa* (1864). See ENGLISH LANGUAGE.

**ANGLO-SAXONS**, the collective name generally given by historians to the various Teutonic or German tribes which settled in England, chiefly in the 5th c., and founded the kingdoms of the Heptarchy. They consisted for the most part of Angles, Saxons, and Jutes. The generally received opinion is, that the first of these invaders made their appearance in Britain in 449, having Hengest and Horsa as their leaders. But under the more searching scrutiny of later writers, these famous leaders have evaporated into mythical heroes of romance, common to most of the Germanic nations; and though the fact of a great Germanic invasion in the middle of the 5th c. is not doubted, it is believed that this was by no means the earliest period at which Germanic settlements were effected in England. Long previous to this period, a portion of the coast, extending from Portsmouth to Wells in Norfolk, was known as the *Littus Saxonium*; but whether in reference to Saxons by whom it was settled, or to roving adventurers of that race by whom it was ravaged, is still a subject of dispute. Of the three tribes mentioned above, the Jutes are believed to have been the first comers. Their original settlements were in what is now the duchy of Slesvig; and the portions of England of which they possessed themselves were Kent, the Isle of Wight, and the opposite coast of Hampshire. The Saxons, who were the next invaders, settled chiefly in the southern and central parts of England—in Sussex, Essex, Middlesex, the south of Hertford, Surrey, the part of Hampshire not possessed by the Jutes, Berks, Wilts, Dorset, Somerset, Devon, and the portion of Cornwall which did not remain in the possession of its former Celtic inhabitants. The Saxons who invaded England probably belonged chiefly to the portion of that great nation, or confederacy of nations, whose territories lay on the shores of the Baltic—occupying what are now the duchy of Holstein, the north of Hanover, and the west of Mecklenburg. The third tribe, whose name and nationality afterwards prevailed over the others—the Angles—did not arrive till a somewhat later period. Coming like the Jutes from the duchy of Slesvig, a corner of which is still called Angeln, they made, from 527 to 547, a succession of descents on the coasts of Suffolk and Norfolk, and latterly, on the country to the north of the Humber, and the southern part of Scotland between the Tweed and the Forth. Eventually, the Angles obtained possession of the whole of England, except the portions already mentioned; that is to say, of all the part to the north of the Avon, on the one side, and the Thames on the other—Essex, Middlesex, and part of Hertford excepted. The union of different bands of these conquerors amongst themselves, with their countrymen who had preceded them, and with the Celtic population which, though conquered, there is no reason to suppose was exterminated, gave rise to the so-called Heptarchy (q.v.)—the kingdoms of Northumbria (originally Bernicia and Deira), Kent, Sussex, Wessex, Essex, East Anglia, and Mercia.

The various independent states into which England had till then been divided, were united by Egbert, king of Wessex, in 827, into the one kingdom of England (the land of the Angles). The royal family of Wessex, which was thus raised to what, for the first time, probably, is entitled to be called the kingly dignity, never again lost its supremacy, except, indeed, during the Danish period (1017 to 1042) till the Norman conquest; and to it Alfred the Great (q.v.) belonged.

The English constitution, the origin of which is sometimes ascribed to Alfred (849-901), was not framed by him, though he restored it and improved it after the deliverance of the country from the Danes. It was essentially the same as that of other Germanic nations. At the head of the government was the *cynning* or *cynig*. The kingly office, among the Germanic nations in early times, had reference solely to the tribes or peoples governed, and never to the land which they occupied. During this period, it was naturally elective; but after the idea of great territorial possessions came to be inseparable from it, it became hereditary, though a form of election, or color of ascertaining the national will, was still retained. The life of the king, like that of every other man, was assessed at a fixed price (*weregild*, q.v.), which was that of an *ætheling*, or person of royal blood, with a sum superadded as the price of his royalty. The first of these sums went to his family, the second to the people. The king possessed the power of calling together the Witenagemôt (q.v.), and of laying before them propositions for the public weal; but he had not the power of dismissing the assembly, so that in England, from the first, the real center of power seems to have been in parliament. Neither was the convocation of the Witenagemôt at the option of the sovereign, for there is every reason to believe that his power was all along limited by the necessity of consulting the principal members both of the clergy and laity of the kingdom; nor, it would seem, could he impose taxes, or declare peace or war, without their consent. The sons and other near relations of the king constituted an aristocracy of birth, called *æthelings* or *æthelings* (the same word with the German *Adel*, noble). Out of the great officers of the state, or immediate servants of the king, was gradually formed a hereditary aristocracy, closely corresponding to that which subsequently existed in feudal times. Of these, the person next in rank to the king was the *ealdorman* ("elderman," Lat. "senator") or *heretoga* ("army-leader"). "But inasmuch as the ducal functions, in the Anglo-Saxon polity, were by no means confined to service in the field, the peculiar title of

heretoga is very rarely met with, being for the most part replaced by ealdorman or aldorman, which denotes civil as well as military pre-eminence" (Kemble, *ut sup.* ii. 126). Though the word is derived from an adjective signifying age, in practice, no such meaning attached to it, more than to senior, which is the original form of the word seigneur. It was to the same class of officials that subsequently the Danish title of *eorl* or earl came to be applied. The powers of these officers probably varied in the different kingdoms, whilst they remained separated; but we shall form, on the whole, a pretty accurate conception of the position of the ealdorman, if we regard him as the governor of the *gû* or shire, the *scirgerefa* or sheriff being his deputy. Much difference of opinion exists as to the rank and position, social and political, of the thane; and all that can be said with confidence is, that before the conquest, it was not convertible with ealdorman, or equivalent to baron, as it came to be after the conquest. The office seems to have implied subordinate landed tenure, similar to that by which the lands of the vassal were held of the lord in feudal times; and thus, whilst the king's thanes were frequently ealdormen, these, in their turn, had thanes of a lower rank, who appear to have been very numerous. This view is strengthened by the derivation of the term from *thegnian* or *thenian*, to serve, which is the same word as the modern German *dienen*, and from the fact of its being frequently translated *minister* in the Latin charters of pre-Norman times. The whole class of ordinary freemen or commoners were called *ceorls*, afterwards *churls* (a word preserved in the German *Kerl*, and in the lowland Scotch *carle*), and were generally associated under the protection of some person of rank and influence, who was called the *hlaford* (our "lord," but *lit.*, "bread-winner," or rather "bread-beginner"). This, however, was in itself no recognized title, and up to a very late period the Anglo-Saxon laws knew no other distinction than that of *ceorl* and *eorl*. The Britons, who retained some degree of freedom, constituted a lower class called *wealhas* or "Welsh" (*lit.* "foreigners," as they seemed to the conquerors). The number of slaves (*theowas*) was not very great, nor does the character of the servitude imposed on them seem, comparatively speaking, to have been oppressive. Different rights and privileges belonged to the different ranks of the Saxon people, and, as we have already said, a different *weregild* (q.v.), or pecuniary estimation, was fixed for each rank, as the penalty for homicide. The great districts or shires were subdivided into tithings (*teothunga*), each containing ten free heads of families, who were held mutually responsible for each other. Ten tithings formed a *hundred*, which had a court subordinate to the court of the shire. In important matters, the ealdorman of the shire could not decide without the concurrence of an assembly (*scirgemôt*, assembly of the shire) or thanes of the shire and representatives of townships, which met half-yearly, and corresponded to the *Witenagemôt* (assembly of the wise), or *micelgemôt* (assembly of the great) for the whole kingdom.

Christianity was introduced among the new-comers in the end of the 6th, or beginning of the 7th c. by St. Augustine, a missionary sent by pope Gregory I., called the great. Augustine became the first archbishop of Canterbury; and before the close of the 7th c., the whole of *Engla-land* was a Christian country under one metropolitan. Ethelbert, king of Kent, was the first sovereign who embraced the Christian doctrine. Bringing with them the traditions and feelings of the empire, the whole influence of the clergy was thrown into the scale of monarchy, and greatly tended to its consolidation. A Christian church, however, already existed in Scotland and the n. of England; and the influence of the Culdees (q.v.) long prevailed against the efforts of the southern prelates to establish uniformity of worship and complete conformity to Rome. But in truth, the English clergy in general were not very submissive to the authority of the popes, who did not succeed in reducing the land to complete subjection till after a long struggle. St. Dunstan (q.v.) gained for them their final victory in the 10th century. During the time of its comparative independence, the English church was distinguished for the learning and laboriousness of its clergy. Bede (q.v.) is the most eminent author whom it produced. Between his time and that of Alfred, a very great degeneracy had taken place both in the learning and efficiency of the clergy, which that active and enlightened sovereign labored to restore, but only with partial success. St. Boniface (q.v.) and many other English and Scottish missionaries labored with success in the propagation of Christianity in Germany.—Besides the works already referred to see Freeman's *History of the Norman Conquest*, and *Old-English History*, and Green's *Short History of the English People* (1875).

**ANGO'LA**, a name often applied to the whole of the w. African coast from cape Lopez de Gonsalvo in lat. 0° 44' s., to San Felipe de Benguela in 12° 14' s.; but, in a more restricted sense, the name of a kingdom in lower Guinea dependent upon Portugal, and extending from the river Coanza on the south, in lat. 9° 20' s., to the Danda on the north, in 8° 20' s. The natives generally call it Donga. The interior is very imperfectly known, and the boundaries uncertain; but A. is supposed to contain about 250,000 inhabitants. The country being well watered, is covered with a most luxuriant vegetation. The heat being moderated by the sea-breeze, the orange and other fruits of the warmer temperate climates are produced, as well as those which are strictly tropical. There is a great abundance and variety of wild animals, and the mouths of the rivers swarm with sharks and crocodiles. The principal rivers are the Coanza and Danda. Much of the country is mountainous. The mountains are covered with forests, and are

rich in metals, particularly copper, iron, and silver, which, with wax and ivory, are the principal legitimate exports, although the great trade, almost to the present day, has been in slaves. Fetichism is the prevailing superstition, and circumcision is general among the natives. A. might easily be rendered very productive both of sugar and cotton, but the manner in which it has been governed by the Portuguese has not tended to develop its resources. They discovered it in 1486, and have had settlements in it since 1488; but the number of resident Portuguese is very small, and they are almost entirely confined to a few spots—forts and commercial establishments called *feiras* or fairs. The capital is Loando, or San Paulo de Loando (q.v.).

**ANGON**, a barbed spear used by many early nations. The Franks, in the 7th c., employed angons both for thrusting and hurling. The staves were armed with iron, so as to leave but little of the wood uncovered; the head had two barbs. When hurled or thrust at an opponent, the head of the A. became fixed in the flesh by means of the barbs. This form of spear was much adopted by the Anglo-Saxon and other Teutonic nations.

**ANGORA**, the Ancyra of the ancients, capital of the Turkish vilayet of the same name, in the mountainous interior of Asia Minor, and distant from Constantinople about 220 m. e.s.e. It is said to have been built by Midas, the son of the Phrygian Gordius; was a flourishing city under the Persians; became the capital of the Gallic Tectosages, who settled in Asia Minor about 277 B.C.; was a principal seat of eastern trade under the Romans; and was made the capital of the Roman province of Galatia Prima. It was the seat of one of the early churches of Galatia, and the scene of two Christian councils held respectively in 314 and 358. A decisive battle between the Turks and Tartars was fought near A. in 1402, in which Timur defeated and took prisoner the sultan Bajazet I. A temple of white marble was erected by the citizens of Ancyra to the emperor Augustus, who had greatly beautified the city, and his deeds were recorded in inscriptions upon a number of tablets and the columns of an altar. These inscriptions, the *Monumentum Ancyranum*, discovered by Busberg in 1558, are important for the elucidation of ancient history. They were first printed in Schott's edition of *Aurelius Victor* (Antw. 1579), and have recently been edited with notes by Franz and Zumpt (Berl. 1845). The present A. is said to contain not more than 40,000 inhabitants, of whom one third are Armenians. It is famous for its breed of goats, with beautiful silky hair, 8 in. long. Of this goat hair, a kind of yarn is made, known as *Turkish yarn* or *camel yarn*, and of which also a manufacture of *camlets* is extensively carried on in A. itself. The name camel yarn has led to mistakes; it has no reference to the camel, but is derived from the Arabic word *chamal*, fine. Of the skin of the A. goat, the fine oriental Morocco leather is made. Many of the animals in this region are characterized by the length and softness of their hair, especially the dogs, rabbits, cats, etc. This peculiarity seems to depend upon the climate, and soon disappears in Europe.

**ANGORNOW**, or NGORNU, a t. of Bornu, central Africa, on the s.w. bank of lake Tchad, 15 m. s.e. from Kukawa. The surrounding country is very level and monotonous, but fertile. The waters of lake Tchad are usually some miles distant from the town, yet the whole intervening plain is sometimes covered with water, and the town itself is liable to destructive inundations. It is a place of considerable commercial importance; the principal articles of trade are slaves, cotton, amber, coral, and metals. The pop. is supposed to be about 30,000.

**ANGOSTURA**, or CIUDAD BOLIVAR, a seaport t. of Venezuela, in lat. 8° 8' n., and long. 68° 55' w., on the right bank of the Orinoco, about 240 m. from its mouth. It is built at a point or pass (*angostura*), where, on both sides, the river is narrowed by rocks to a width of 3134 ft., after having measured 3 m. across at thrice the distance from the sea. The site of A. is only 191 ft. above the sea-level—an elevation which, on the intermediate distance as above, yields an average of less than 10 in. to the mile. In fact the bottom of the river in front of the town is lower than the surface of the sea, for, even in the lowest state of the water, it is said to be 200 ft. deep, with a margin for floods to the amount of 50 or 60 ft. more. Under these circumstances, the bed of the stream must be about 250 ft. under the level of the city, or about 60 ft. under the level of the sea. When the river does rise to its highest, there are at least portions of the city inundated; and instances are believed to have occurred in which careless people were devoured by alligators in the very streets. Chiefly, as is supposed, through the free access of the trade-winds over the flat surface of the country, A. enjoys, in proportion to its latitude, a singularly temperate climate. Even in the hottest season of the year, the thermometer is said seldom to show more than 86° F.; while, between the beginning of Nov. and the end of April, it ranges from 77° by day to 69° by night.

The situation of A. is highly favorable, in a commercial view. The basin of the Orinoco, which lies nearly all above the town, and is estimated to contain 250,000 sq. m., or more than twice the area of the British isles, is particularly rich towards the north. On that side it reaches very nearly to the coast-line, so as to comprise some of the best parts of Venezuela. Towards the south, again, it consists, in a great measure, of boundless plains, traversed by countless herds of cattle. Over the whole of this vast basin, and that almost equally in both directions, the main stream and its affluents are, with hardly any interruptions, navigable to near the foot of the mountains. Owing to the impetuosity of the currents and the obstruction of shoals, sailing-vessels are said to take fifteen

days to sail up to A.; but with steam-navigation these impediments would in great measure disappear.

With such advantages of position, A. was a flourishing mart before the commencement of the war of independence; but the civil broils materially interfered with its prosperity. As far back as 1807, A. had 8500 inhabitants; ere twenty years elapsed, the population had been reduced to little more than a third part of the number. According to later information, however, it was rapidly approaching its former amount.

**ANGOSTURA BARK**, or **ANGUSTURA BARK**, the aromatic bitter bark of certain trees of the natural order *rubiaceæ* and tribe *cuspariæ*, natives of the tropical parts of South America. It derives its name from the town of Angostura, where it is a considerable article of commerce. It was first brought to England in 1788. It is used in medicine as a remedy for weakness of digestion, diarrhoea, dysentery, and fevers. It is tonic and stimulant. The most important of the trees producing it is the *galipea officinalis*, which grows upon the mountains of Columbia and near the Orinoco. It is a tree of 12 to 20 ft. high, and 3 to 5 ft. in diameter, having a gray bark, trifoliate leaves, with oblong leaflets about 10 in. long, which, when fresh, have the odor of tobacco, and flowers about an inch long, in racemes, white, hairy, and fragrant. The bark contains a chemical substance not yet sufficiently examined, called *angosturin*, *cusparin*, or *galipein*, to which its medicinal efficacy is ascribed. It is supposed that a variety of A. B. is produced by *galipea cusparia* (called by some *bonplandia trifoliata*), a majestic tree of 60 to 80 ft. in height, with fragrant trifoliate leaves more than 2 ft. long. A. B. is believed to be one of the most valuable of febrifuges; but its use is at present very limited, and has, indeed, in some countries of Europe, been prohibited, in consequence of its frequent adulteration with the poisonous bark of the *strychnos nux vomica*, or the substitution of that bark for it. This poisonous bark is sometimes called *false A. B.* It differs from the true A. B. in having no smell, in its much greater weight and compactness, in its inner surface being incapable of separation into small laminae, and in the effects which are produced upon it by acids and other tests, particularly in its outer crust being rendered dark-green or blackish by nitric acid, whilst that of the true A. B. is rendered slightly orange-red.

**ANGOT**, or **ANGO, JEAN**, d. 1551; a French merchant, in African and East India trade. When some of his ships had been taken by the Portuguese he provided and fitted out an armed fleet that kept Lisbon blockaded until he had received indemnity for his losses. Immensely rich at one time, he lost in speculations and in money lent to the king of France, and his last years were passed in destitution.

**ANGOULÊME**, the capital of the department of Charente in France, and formerly of the province of Angoumois. It is situated on the Charente, and has narrow and crooked streets, a number of paper-mills, manufactures of woolen stuffs, linen, and earthenware, etc., and a pop. (1876) of 28,665. It possesses a royal college, a museum of natural history, and several other useful institutions. In the center of the town stands the remnant of the ancient castle of A., in which was born the celebrated Marguerite of Navarre, the authoress of the *Heptameron*, and other works. The railway from Paris to Bordeaux passes through it. Much saffron and wine are produced in the neighborhood. The province of Angoumois was in early times a county; but the heir of it, in the beginning of the 14th c., being an adherent of the English, Philip the fair took possession of it, and it became an appanage of younger branches of the royal family. It was made a duchy by Francis I., and was sometimes bestowed upon natural sons of the French kings. Charles de Valois, Duke of A., a natural son of Charles IX. was a distinguished general in the reigns of Henry IV. and Louis XIII.

**ANGOULÊME, CHARLES DE VALOIS, DUC D'**, 1573-1650; son of Charles IX. of France, and Marie Touchet; reared by his uncle Henry III. One of his half-sisters, the marchioness of Vermeuil, became the mistress of Henry IV. Charles was well educated, and at the age of 16 was grand prior of France in the order of knights of Malta. In 1591, he married a daughter of marshal d'Amville, afterwards duke of Montmorenci. In 1589, Henry III. was assassinated, but on his death he commended Charles to his successor, Henry IV., by whom he was made colonel of horse; but the relationship of his sister to the king so displeased him that he joined with the duke of Savoy, Biron, and Bouillon, one of their main purposes being to force the king to repudiate his wife and marry the marchioness. Biron and Charles were arrested, and the former was executed, but the latter was released after a short imprisonment, owing to the influence of his relative, aided by his aunt the duchess d'Angoulême, and his father-in-law, the marquis d'Entragues. In 1604, he and his father-in-law were condemned to death and his mother to perpetual imprisonment in a convent; the woman obtained pardon and had the other sentences commuted to perpetual imprisonment. A. was in the Bastille 11 years, but in 1616 he was released and restored to his rank of colonel-general of horse. He was afterwards engaged in an important embassy to Germany. In 1627, he commanded the large force assembled for the siege of La Rochelle; in 1635, he was general of the French army in Lorraine, and in 1636 lieutenant-general of the armies. He was the author of *Memoirs from the Assassination of Henry III. to the Battle of Arques*, and other works.

**ANGOULÊME**, LOUIS ANTOINE DE BOURBON, DUC D', the eldest son of Charles X. of France, and Dauphin during his father's reign, was b. at Versailles on the 6th Aug., 1775. He retired from France along with his father at the commencement of the Revolution, and spent some time in military studies at Turin. In Aug., 1792, he entered Germany at the head of a body of French emigrants, but the ill success of the campaign and his own unfitness for military command led to his seeking tranquillity along with his father at Edinburgh. Till 1814, he continued an exile from France, wandering from one place to another on the continent, and latterly resident with the other members of his family in England. On the entrance of the allies into France, he appeared at the British headquarters at St. Jean de Luz, and thence issued a proclamation to the French army. He entered Bordeaux under protection of the British on 12th Mar., and made liberal promises in the name of his uncle, Louis XVIII., among which was that of complete religious liberty. He was again in the south when Napoleon returned from Elba. He was appointed lieutenant-general of the kingdom, and hastened with such forces as he could collect to oppose the emperor; but although he obtained some advantages at first, he was soon deserted by his troops, was for some days detained a prisoner, and at last sent away in a Swedish merchant-vessel to Barcelona. After the second restoration, he was sent by Louis XVIII. to the southern provinces to repress the political and religious movements there, and in 1823 he led the French army into Spain to put an end to the constitution. A man of phlegmatic disposition and mean abilities, he was, in all political matters, a tool of the ultra-royalists and the priests. When the revolution took place in July, 1830, he signed, along with his father, an abdication in favor of his nephew, the Duc de Bordeaux; and, when the Chambers declared the family of Charles X. to have forfeited the throne, he accompanied him into exile to Holyrood, to Prague, and to Görz, where he died, 3d June, 1844.

**ANGOULÊME**, MARIE-THERÈSE-CHARLOTTE, DUCHESSE D', the daughter of Louis XVI., was b. at Versailles on 19th Dec., 1778, and early displayed much quickness of intelligence and energy of character, with the most tender sympathy in the distresses of others. Having passed through the horrors of the revolution, and endured a long imprisonment, she was exchanged, on 25th Dec., 1795, for some French prisoners in the hands of the Austrians, and lived at Vienna till her marriage, in 1799, with her cousin, the Duc d'Angoulême, whose subsequent fortunes she shared. She survived him seven years, and d. Oct. 19, 1851.

**AN'GRA**, the capital of the Azores, a seaport at the head of a deep bay on the s. coast of the island of Terceira, lat. 38° 38' n., long. 27° 14' w. It is a station for ships between Portugal and Brazil and the East Indies; but the harbor is very much exposed. It is the seat of the Portuguese governor-general of the Azores and of the bishop; is well built, but dirty; strongly fortified, and protected by a citadel at the foot of the Monte de Brazil; contains a military college and arsenal, several scientific and literary societies, a cathedral and numerous churches; and about 23,000 inhabitants. There is a considerable export of wine, cheese, honey, and flax. This city furnished an asylum for the Portuguese regency from 1830 till the taking of Oporto, in 1833, by Don Pedro.

**ANGRA** [this from Supplement corrects the preceding], the capital of the Azores, beautifully situated on the s. coast of the island of Terceira. Its harbor is the best in the island, but is exposed to violent storms during certain months of the year. The principal exports are wine and grain. The town is strongly fortified. It is the seat of the bishop of the Azores, and has a cathedral. The streets are broad, and have foot-paths, and the houses are mostly of three stories. Pop. about 12,000.

**AN'GRI**, a town of South Italy, in the province of Salerno, and 17 m. n. w. from Salerno, not far from the Naples and Nocera railway. The surrounding country abounds in vineyards and cotton plantations. Pop. 6921.

**ANGUILLA**. See EEL.

**ANGUIL'LA**, or LITTLE SNAKE, one of the West India islands, so called, perhaps, from its long and narrow figure. Next to Anegada, it is the most northerly of the Lesser Antilles, lying almost due east of the eastern extremity of Porto Rico, in lat. 18½° n., and in long. 63°-64° w. It belongs to England, having an area of 35 sq. m., and a pop. (1871) of 2773. It is low and wooded; but its cleared spots produce cotton, tobacco, and sugar. Its harbor, such as it is, is beset with reefs; but there is said to be good anchoring-ground in the channel between A. and the isle of St. Martin to the south.

**ANGUIS**. See BLIND-WORM.

**ANGUS**, EARL OF. See DOUGLAS, *ante*.

**ANGUS**, JOSEPH, D.D., b. 1816; educated at Edinburgh university; president of Regent's Park (Baptist) college, London; author of the *Bible Hand Book*, *Hand Book of English Literature*, and other works; one of the revisers of the English New Testament for the American Bible union, and a member of the committee of the convocation of Canterbury for similar revision. He visited the United States in 1873 as one of the delegates to the Evangelical Alliance.

**ANGUSSO'LA**, or ANGUISCIO'LA, SOFONISBA, 1533-1620; one of the best portrait painters of the latter part of the 16th century. In 1560, at the invitation of Philip II.

she visited Madrid, where her work received great praise. Vandyck is reported to have said that he derived more knowledge of the principles of his art from her conversation than from any other source. Specimens of her work are to be seen in Madrid, and in Florence, and one portrait of herself is at Althorp. She had three sisters, all of whom were artists of repute.

**AN'HALT**, one of the oldest principalities of Germany, and now a state of the Germanic empire, is situated on the Elbe, the Mulde, and the Saale. It consisted formerly of three duchies—A.-Dessau, A.-Bernburg, and A.-Köthen. A. contains 896 sq. m. Pop. '72, 203,354; '75, 213,689. A. is almost entirely surrounded by the Prussian territories, which intermix with it and divide it into portions. Dessau, Zerbst, Bernburg, and Köthen, are the principal towns. The country is level and fertile, producing wheat, flax, rape-seed, hops, and tobacco. Wine is produced on the Saale. Agriculture is the chief employment of the people, who are generally Protestants. Part of the former duchy of A.-Bernburg approaching the Harz mountains possesses mineral wealth in iron and other mines. A. began to be an independent principality in the first half of the 13th century. It has been repeatedly, in the course of its history, divided amongst branches of the reigning family. The division into three duchies dates from the beginning of the 17th century. It was divided originally into four parts, but the line of A.-Zerbst has become extinct. The three duchies were independent of each other; but a family compact connected the reigning lines, which often led them to take public action conjointly. Some of the princes of A. have been eminent in the political, military, and ecclesiastical history of Germany.

**ANHYDRIDES**, is the term now commonly given to the compounds formerly known as anhydrous acids, which was a very unsatisfactory name, seeing that these bodies do not present any of the ordinary properties of acids. In some cases, they are the result of the dehydration of acids, and in all cases they represent in their composition the acid *minus* water. One of the most eminent French chemists, prof. Wurtz, lays down the following general principles: "(1) The anhydrides of monobasic acids (*a*) contain the elements of two molecules of a monobasic acid, *minus* 1 molecule (which corresponds with 2 atoms) of water; (2) the anhydrides of bibasic acids (*b*) contain the elements of a molecule of a bibasic acid, *minus* a molecule of water; (3) the anhydrides of tribasic acids (*c*) contain the elements of a tribasic acid, *minus* water." Thus, using the modern formulæ and the type theory, we give a case of each form of acid:

The reader who may not at once be able to interpret these formulæ, will readily see that  $\left(\begin{smallmatrix} \text{NO}_4 \\ \text{H} \end{smallmatrix} \right) \text{O}_2 = \text{NO}_5.\text{HO}$ , the old formula for nitric acid, that  $\begin{smallmatrix} \text{S}_2\text{O}_4 \\ \text{H}_2 \end{smallmatrix} \text{O}_4 = 2(\text{SO}_3.\text{HO})$ , the old formula for sulphuric acid, which is now universally placed amongst the bibasic acids; and that  $\left(\begin{smallmatrix} \text{PO}_2 \\ \text{H}_2 \end{smallmatrix} \right) \text{O}_6 = \text{PO}_5.3\text{HO}$ , the old formula for tribasic phosphoric acid. According to the old system, the three anhydrides would be represented by  $\text{NO}_5$ ,  $\text{SO}_3$ , and  $\text{PO}_5$  respectively. We might have taken organic acids, as, for example, acetic acid, succinic acid, in place of nitric and sulphuric.

The anhydrides of the monobasic acids are formed in various ways; thus, hypochlorous anhydride is formed by the action of chlorine on oxide of mercury; nitric anhydride is formed by the action of chlorine on nitrate of silver, etc. By the action of ammonia, the anhydrides of monobasic acids are converted into amides; thus, benzoic anhydride ( $\text{C}_{14}\text{H}_5\text{O}_3$ ) + ammonia ( $\text{NH}_3$ ) = benzamide ( $\text{C}_{14}\text{H}_7\text{NO}_2$ ) + water ( $\text{HO}$ ). The anhydrides of tribasic acids are often formed by the mere action of heat on the acids, as is the case with lactic and tartaric acids.

The anhydrides present no uniformity of appearance; for example, carbonic anhydride (commonly known as carbonic acid, which in reality is  $\text{CO}_2.\text{HO}$ ) is a gas; phosphoric anhydride is a white powder; nitric anhydride occurs in crystals; sulphuric anhydride is a ductile wax-like substance; while the anhydrides of the organic acids are oily bodies heavier than water.

The most important property of this class is their conversion into the corresponding acids, under the influence of water.

**AN'HYDRITE**, a mineral, consisting of anhydrous sulphate of lime, with some slight addition of sea-salt, appears in several varieties, as, 1. Granular; found in concretions with a foliated structure: 2. Fibrous; easily broken with a fracture in delicate parallel fibers: 3. Radiated; translucent: 4. Sparry, or cube spar: 5. Compact, of various

shades, white, blue, gray, red. A. is converted into gypsum by combination with a certain proportion of water, and where it is found in large masses, as on the s. of the Harz mountains near Osterode, the surface consists of gypsum. For building, A. has no great value, on account of its tendency to this change; but some of its varieties, especially the siliciferous or vulpenite, found at Vulpino, in upper Italy, are used for sculptures, and take a fine polish. When burned and reduced to powder, it is used as a manure, resembling gypsum in its effects.

**ANHYDROUS** is the term applied to a chemical substance free from water. Thus, ordinary lime-shell as it comes from the kiln is simply lime ( $\text{CaO}$ ) without any water, and is called *anhydrous* lime; but when water is thrown upon the lime-shell, the liquid disappears by combination with the lime, which very much increases in volume and becomes *hydrated* lime ( $\text{CaO}, \text{HO}$ ). Again, ordinary stucco, before being used by the modeler, contains only lime and sulphuric acid ( $\text{CaOSO}_3$ ), with no water, and is therefore anhydrous; but when water is added, and the stucco sets into its mould, it combines with two equivalents of water, and becomes hydrated stucco ( $2\text{HO}, \text{CaOSO}_3$ ). Examples of A. substances are also found amongst liquids; thus, alcohol free from water is called A. alcohol; and in like manner we speak of A. acetic acid, A. nitric acid, etc.

**ANILINE** is now universally regarded as, in a technological point of view, one of the most important organic compounds yet discovered (see DYE-STUFFS). Its chief physical and chemical characters are described under the head of *Phenyl* (q. v.), an organic radical, represented by  $\text{C}_{12}\text{H}_5$ , which, if aniline is (as Hofmann believes) a derivation of

ammonia, replaces one of the atoms of hydrogen, yielding  $\left. \begin{array}{c} \text{C}_{12}\text{H}_5 \\ \text{H} \\ \text{H} \end{array} \right\} \text{N}$ , or  $\text{C}_{12}\text{H}_7\text{N}$ , which

is the formula for this compound. There is one salt of aniline which requires notice, because its therapeutic value has been highly praised—viz., the sulphate of aniline, which is prepared by saturating a certain amount of aniline with dilute sulphuric acid, evaporating to dryness, and extracting the residue with boiling alcohol, which, on cooling, leaves white silvery scales of sulphate of aniline. To obtain the salt quite pure, it may be dissolved and separated a second time, after which it must be preserved in well-stoppered bottles. The importance which the aniline manufacture as a dye-stuff has acquired during the last few years has led to the study of its physiological, therapeutical, and toxicological properties, and hence to the hygienic precautions which should be adopted in the chemical works devoted to its preparation, as well as to the influences which the aniline colors may exert on those who employ them in dress, etc.

The *physiological* action of aniline has been recently studied by nearly a dozen independent observers, and the following are the principal results at which they have arrived: (a) When administered internally in a moderate dose, this substance causes a considerable muscular excitement, lasting for some minutes, and then gradually disappearing. When given in a *poisonous* dose, it causes an immediate flow of viscid saliva, from which the animal tries to free itself by rubbing its mouth on the ground; in about ten minutes it becomes quiet and dull, and coldness supervenes, which continues and increases till death. The other most apparent symptoms are convulsive spasms, which first affect the hind legs, but soon extend to the anterior extremities. The eyelids are widely separated, while the pupils are somewhat contracted; and the tumultuous beating of the heart and the hurried respiratory movements show that the convulsive state of the other muscles has extended to those which regulate the most important vital functions. From 10 to 15 drops of aniline will thus prove fatal to a rabbit or to a dog of medium size. In still larger doses the poison causes the animal's head to be convulsively drawn backwards, and death rapidly ensues. On examination after death, an odor of aniline is found to be given off by the blood, whose globules, when microscopically examined, are found to be partially disintegrated and deprived of their red pigment. (b) Its effects on animals, as well as those of nitro-benzine, from which it is produced, when *inhaled in a state of vapor*, have been carefully studied by M. Bergerow, whose experiments were so arranged as imitate the conditions to which workmen are exposed in the aniline manufactories. As might be expected, the effects of aniline are slower and less marked than when the substance is introduced into the stomach, but are of the same character—the spinal cord and muscular system being more or less *excited*; while the vapor of nitro-benzine, which seems to act primarily on the brain, causes stupor. On the whole, the experiments tended to show that aniline, notwithstanding the terrible spasmodic symptoms which it excites, is less serious in its consequences and more transient in its action than nitro-benzine. The phenomena observed in experiments on animals closely correspond with those which have been observed in cases in which man has been exposed to the noxious vapor. The following case recorded by Mr. Knaggs seems well to illustrate the effects of inhaling a large dose of aniline vapor: A workman broke a carboy containing a large quantity of this liquid, which fell over him without entering his mouth. In trying to wipe up the aniline, he respired the vapor for some time, felt giddy, and complained of his head and chest. When seen some hours afterwards, his face and body were of a livid leaden blue; the lips, gums, tongue, and eyes of a corpse-like bluish pallor; he was breathing by gasping, and appeared at the point of death. There was then no convulsion, and he was quite sensible. His pulse was small and

irregular. Under very energetic treatment (alcohol, ammonia, chloric ether, internally, and cold affusions and sinapisms externally), he recovered. According to Dr. Letheby, who has reported a similar case, the aniline undergoes changes in the blood similar to those which it undergoes in the formation of the dye-stuffs; and the mauve, magenta, etc., that are thus formed in the circulation, occasion the blue or violet color which the gums and mucous membrane of the mouth present in these cases.

The symptoms observed in the various experiments on animals led several physicians to try its therapeutic action in diseases of the nervous system. Sulphate of aniline was the form selected, and chorea the disease on which it was especially tried, although it has also been administered in epilepsy and other nervous diseases. The results are contradictory; and till further evidence of its value is adduced, it is not likely to supplant other medicines of the same class.

The workmen employed in the fabrication of nitro-benzine and aniline (for the two are prepared in the same works) suffer, for the first day or two after commencing this occupation, from severe supra-orbital headache, frequently accompanied with nausea and vomiting. While some persons suffer so severely that they are compelled to seek another employment, most, after a fortnight's experience, cease to feel the ill effects, except accidentally, as after extra work or intense heat. Till they become seasoned, most suffer from vertigo, which rapidly disappears on exposure to a current of fresh air, and sometimes the vertigo is succeeded by loss of consciousness. Sometimes the face becomes congested, the patient staggers and falls to the ground in a semi-comatose state like a drunken man; in the course of an hour or two he wakes up, suffering only a feeling of fatigue. In other cases, regular epileptiform convulsions of the limbs and tetanic spasms of the neck are observed, the patient often remaining in this state for an hour or more before recovery. Such may be regarded as the *acute* symptoms exhibited by new hands. Those who have become seasoned, complain of great general languor, a partial loss of sensation in the upper extremities, and constipation of the bowels; and they almost always present a decolorization of the skin and mucous membranes, in consequence of the impoverished state of their blood, which is said to be rapidly restored by making the patient inhale oxygen gas or compressed air. In reference to the influence of the aniline colors on the health of those who use them, it may be remarked, that even if they were poisonous, they adhere so tenaciously to the stuffs that are dyed with them, that there is no fear of the detachment of a noxious powder, as in the case of the arsenical greens. But fortunately they seem perfectly harmless even when taken internally, according to Sonnenkelb, provided they are completely freed from the arsenic, lead, mercury, or other poisonous metal that has been employed in the oxidation of the aniline. Hence, when they are quite pure, fuchsine and the allied pigments may be safely employed in coloring sweetmeats, liqueurs, confectionery, ices, etc., which it is very satisfactory to know, seeing how largely they are at the present day employed.

**ANIMA**, Cox, in music; with animation, in a spirited manner.

**ANIMA MUNDI** literally signifies "the soul of the world." The doctrine contained in this phrase was a favorite one with the early philosophers, who conceived that there resided in nature a force immaterial, yet not intelligential, which was the source of all physical and sentient life. Plato held it impossible for pure spirit—the atmosphere in which alone eternal and archetypal ideas could exist—to bear any relation whatever to matter, and he therefore supposed the latter to be operated upon by an inferior agency, the *A. M.* In the system of the Stoics, the *A. M.* was conceived to be the sole vital force in the universe; it usurped the office of pure spirit, and the doctrine became indistinguishable from pantheism (q.v.). The notion does not seem to have been entertained by the schoolmen, but it reappears in the writings of Cornelius Agrippa, Paracelsus, and Van Helmont, and, in a modified form, was held by More, Cudworth, and others.

**ANIMAL and ANIMAL KINGDOM.** According to a very old classification, all bodies are divided into three kingdoms—the mineral, the vegetable, and the animal. Animals and vegetables are again classed together as *organic*, in opposition to minerals, which are *inorganic*. Mineral bodies are masses of matter without internal movement, increasing by additions from without, having, with the exception of crystals, no determinate form or size, homogeneous throughout, and without relation of one part to another. Animals and plants, on the contrary, exist as individual beings, consisting of various organs. Their existence has a beginning and an end, and at their death they are replaced by other similar beings developed out of them.

The distinction between animals and plants strikes us at once in the higher classes; but among the lower organisms there are beings which have been at times classed among animals, at times among plants. The marks of animality which, with very few exceptions, have as yet been found to exist in all animals, are spontaneous motion, the existence of a special digesting apparatus (it may be only a mouth and a stomach), and sensation by means of nerves. The prevalence of nitrogen as a chemical ingredient is another general characteristic of animals, while carbon prevails in plants. Most animals, though not all, possess the faculty of *loco*-motion (q.v.); it is wanting in some, as the oyster and polype. This locomotion is generally effected by appropriate organs, which are very different in the different classes of animals, as legs, wings, fins, suckers, cilia, etc., sometimes merely by muscular dilatations and contractions. In the higher

animals, it is connected with a special system of bones and muscles, which becomes less and less prominent as we descend in the scale, and at last disappears.

Nutrition is effected by swallowing and digesting organic matter by means of a mouth, stomach, and intestinal canal. A part of the food—the *chyle*, namely, which results from digestion—is taken up by a system of vessels into the body of the animal, and thrown into the blood, into which, under the action of the air in the lungs or gills, it is converted; the other part is excreted by a second orifice, except in some of the lowest forms where the mouth forms the exit. For keeping up a circulation of the blood, which must be brought to all parts of the body for the purpose of nourishment, there is provided a system of blood-vessels and, in the higher classes, a heart. See HEART. Nutrition may, to some extent, take place also by absorption from the external surface; but this is not considerable except, perhaps, among the lowest classes of animals. The substances that serve for the nutrition of an animal are either vegetable or animal, and the mouth and other organs are adapted accordingly. The number of omnivorous animals is small, and among these man has the greatest latitude of choice.

Propagation or reproduction takes place in a great variety of ways; among the lowest forms, by division, gemmation or budding, and cell-germs; among the more perfect, by generation between two individuals of different sex. Of the two sexes, the male is generally distinguished by superior size and strength, more brilliant coloring, larger appendages, and often stronger voice. Besides male and female, there are among some animals (bees and ants) neuters. In some of the lower kinds, the individuals are hermaphrodite. See REPRODUCTION.

All animals develop gradually, and most of them go through one or more changes of form or metamorphoses. This is most marked among insects which go through the four stages of egg, larva, pupa, and perfect insect. The class of reptiles with naked skins also go through changes, though less striking. In the higher animals, these transitions through a series of forms take place in the ovum, or before birth. In some cases the embryo comes to maturity after the exclusion of the ovum (birds and amphibia); in others (mammalia), within the body of the mother: animals of the last kind are called viviparous. The reproduction of some intestinal worms is peculiar; the egg of the mother-animal produces a sexless creature—a nurse—the eggs laid by which reproduce the original animal. A somewhat similar peculiarity is observed in some insects, as aphides. See APHS.

The life of animals is dependent on many conditions. Among these rank warmth, atmospheric air, and moisture, along with sufficient nourishment. Light also is essential to many, though most of the colorless animals of the lower classes can dispense with it. With regard to outward pressure, the limits are wide, as is seen in the condor soaring to a height of 20,000 ft., and the whale descending to a depth of 1000 ft. below the surface of the sea. But individual animals are confined to much narrower limits; often to one circumscribed range of climate, one species of food, one medium. To go beyond those limits, though it does not always occasion death, yet gives rise to various degrees of degeneracy, from which even man with all his powers of adaptation is not exempt.

Most animals give more or less strong indications of mind: in those high in the scale, this mental life rises to intellect capable of cultivation, while in the lower classes it appears as instinct confined to a few operations. For communicating with the outer world, vertebrated animals are provided with a nervous system in connection with a central brain—a *cerebral* nervous system; the *ganglionic* nervous system of the lower animals seems to serve this purpose less and less as we descend in the scale. The impressions from without are received immediately by the organs of sense, which become more numerous and complex the higher the animal stands in the scale; among the highest, five senses are usually distinguished, which are variously developed in different species—in none so harmoniously as in man.

Nocturnal sleep, being the means of gathering strength for the activity of the waking hours, stands in intimate relation to that activity, and therefore is wanting in beings low in the scale. Winter sleep, or hibernation (q.v.), serves many animals instead of migration, to enable them to outlive the cold and hunger of winter. Analogous is the summer sleep of serpents and crocodiles, which lie buried in the dry mud during the summer droughts of the tropics.

Of the other vital manifestations of animals may be mentioned the faculty of giving *light* (glow-worm, medusæ), and that of developing *electricity*, both possessed only by a few; also *voice*, belonging almost exclusively to vertebrate animals, and of them chiefly to the warm-blooded.

A very remarkable peculiarity occurs in some of the lowest kinds of animals, in what may be termed a composite life; individuals which separately manifest many of the powers of life being united in part of their frame, many of them together into one living mass. Of this, examples are numerous among the zoophytes (q.v.), some of which have already been noticed in the article ALCYONUM.

Apart from the transforming and modifying influence of man, the animals and plants of a district—its *fauna* and *flora*—give it life and character. To man himself, animals stand in a variety of relations of the highest importance. Some are directly useful to him for labor, food, the chase, etc.; others hurtful, as destroyers of vegeta-

tion, as beasts of prey, as vermin, or by their poisons.—The number of known species of animals amounts at present to about 150,000. To describe and classify these on scientific principles, is the object of zoology (q.v.).

**ANIMAL CHEMISTRY.** The object of researches into the chemical nature of animal substances is twofold: First, to classify the proximate or immediate component ingredients of the animal body, study their properties, their mutual relations and metamorphoses, and the ultimate elements of which they are composed; second, to investigate the processes that go on during the elaboration and assimilation of new materials, and the wearing out and excretion of old—processes that, taken together, constitute nutrition, or the vegetative side of animal life. Without a pretty complete knowledge of the first part, no successful researches can be made in the second; and it is chiefly owing to the great progress that has been made within the last thirty years in the knowledge of the chemical properties of the animal compounds containing nitrogen that we owe the recent advance in our knowledge of the chemical processes of life. That advance is not the less decided that we are still far from a complete understanding of them. The general laws of chemistry are now traced into the province of organic nature much further than formerly, and the abrupt partition between the two is removed. It is still acknowledged that these laws operate differently within the sphere of organic life, from what they do without; but instead of resting contented with saying, that owing to the vital force this could not be otherwise, the aim is now to trace the why and wherefore of this modified action as far as possible.

In the animal body two classes of substances may be distinguished: those that properly compose the body, and those that are on the way either into it or out of it. The former, or actual components of the body, are, again, of two kinds: 1. Substances that compose the actual tissues of the organs, and in which the vital functions seem properly to inhere; the substances, namely, of muscle, of nerve, of brain, of membranes, sinews, and the organic part of the bones. All these agree in consisting chiefly of carbon, hydrogen, nitrogen, and oxygen, with usually minute proportions of sulphur and phosphorus. But in respect of their mode of composition, they fall into two classes—those that yield gelatine on boiling, and those that do not. To the former belong the substance of the cartilages, bones, sinews, and skin; to the latter the fibrin of the muscles and of the blood corpuscles, the albumen of the nerves and blood, the caseine of milk, etc. These last are the so-called compounds of proteine (q.v.). In the living tissues all these matters are combined with about 90 per cent of water. 2. Besides the above, which are the real animalized or vital substances, the animal body contains substances which are merely deposited in the cells and interstices of the former for imparting color, solidity, elasticity, etc. Of this kind are fat, the earthy matter of the bones, pigment, etc. Whether the minute quantities of common salt and of phosphates that are found in all parts of animals essentially belong to the constitution of the substance they are associated with, is not yet made out, but it is extremely probable they do; at all events they play a very important part.

The substances that are on their way into and out of the body form on the one hand the contents of the digestive organs, and on the other those of the organs of excretion. The vascular system forms the means of communication between both and the substance of the body, and the blood is the carrier of all that enters that substance or leaves it. In the digestive organs, accordingly, we find, along with the unaltered materials of the food, the various products of their digestion, and at last the useless refuse, not absorbable by the vascular system, and the various fluids—some acid, some alkaline—added to the food to effect its digestion, such as the saliva, gastric juice, and bile.

The matters prepared in the digestive organs for being taken up into the blood, either enter the venous system directly, or get there by first going through the lymphatic system. This last contains a fluid which is chemically very like the blood, but colorless—the chyle, namely. This fluid and the blood contain the so-called proteine compounds derived from the food, partly in solution, and partly solid in the blood corpuscles. Arterial blood contains, besides, all those salts and other substances that must be supplied for the nourishment of the various organs. The venous system, again, which brings back the blood from the different parts to the central organs, is laden with all the matters that are no longer of use, and must therefore be carried to the chief excretory organs—the skin, liver, and kidneys. The dark color of venous blood indicates that its components have undergone a change. But all blood that is on its way both to and from the parts of the body, before it can impart nourishment, must pass through the lungs, an organ in which it is brought into extensive contact with atmospheric air, and undergoes a process of oxidation, producing the following palpable results: The disappearance of a portion of the inhaled oxygen, and the substitution of water and carbonic acid in its place; the transformation of the dark venous blood and of the chyle into red arterial blood; lastly, the development of heat. Breathing, then, contributes to nutrition by making the blood fit for that purpose; it is an excretory process, inasmuch as it burns out useless matters and separates them in the form of gases; and at the same time it produces heat, without which life could not go on.

Sweat, urine, bile, and emanations from the skin and lungs, contain only products of the decomposition of effete animal substances; many of these products are highly interest-

ing in a chemical point of view, especially urea, uric acid, and bile. It is clear, then, that comparative investigation of the blood in its different states, of the excretions and secretions, can alone give any knowledge of the condition of the vegetative side of the organism; and, accordingly, this kind of investigation has in recent times become of the highest importance for pathology and diagnosis. See Liebig's famous work on *A. C.*, translated by Gregory, and the excellent *Lehrbuch der Physiologischen Chemie* (3d ed., Leip. 1854), by Lehmann.

**ANIMAL FLOWER.** See ACTINIA, and ANEMONE (SEA).

**ANIMAL HEAT** is that generated in animal bodies by certain of the changes constantly taking place within them. A certain amount of heat is necessary to the proper performance of the functions of the body, and any material increase or decrease of it from the healthy standard endangers life. The air and other objects surrounding the body being in almost all cases colder than it, are constantly stealing part of its warmth; but within the system there are processes incessantly going on which produce more heat. When the heat thus generated is not dissipated fast enough, so that the body tends to become warmer than the due degree, the accumulation finds vent in perspiration, the evaporation of which carries off the excess. The power of producing heat is in relation to the climate in which the animal is accustomed to live. It is weaker in warm climates than in cold, and consequently, when an animal is removed from a warm to a cold climate, it frequently pines and dies. In most fish and reptiles, commonly termed "*cold-blooded animals*," the temperature differs but little from that of the water or air in which they live; the same is the case with hibernating animals during the latter part of their torpid condition.

Man has the power, to a greater degree than other warm-blooded animals, of adapting himself to changes of surrounding temperature. His average standard of heat is about  $98.4^{\circ}$  F., varying with circumstances, being slightly higher after exercise or a hearty meal, and at noonday than at midnight. It also varies in diseased conditions of the body, rising to  $106^{\circ}$  in a fever, and falling as low as  $77^{\circ}$  in cholera. But if the body be in a healthy condition, the standard of heat is maintained, even when the person is exposed to intense heat, as in the case of men attending furnaces; one can for a short time be exposed to  $350^{\circ}$  of heat without materially raising the temperature of his own body, although he will lose weight by the copious perspiration necessary for the evaporation.

Throughout the animal kingdom the power of generating heat bears a close relation to the activity or sluggishness of the animal. Thus, many birds, which are perpetually in action, have the highest temperature ( $100^{\circ}$ – $112^{\circ}$ ); and the swallow and quick-flighted birds, higher than the fowls which keep to the ground. The higher the standard of A. H. the less able is the animal to bear a reduction of its temperature; if that of a bird or mammal be reduced  $30^{\circ}$ , the vital changes become slower, more languid, and death ensues. Fish and frogs, on the other hand, may be inclosed in ice and yet survive.

The sources of animal heat in the living body are the chemical and physical changes continually taking place. The chemical changes are those occurring in respiration, digestion, nutrition, secretion, and muscular and nervous action. It has been shown experimentally that when those functions are performed there is an increase of temperature. Heat is, no doubt, also produced by any movements causing friction. The ultimate sources of heat are (1) the energy locked up in the food consumed; and (2) in the oxygen inhaled in respiration. The food, in the processes of digestion, is split up into its constituent parts; these are absorbed, and may become parts of the textures and fluids of the body for a time; and these textures, in the performance of their functions, disintegrate, become redissolved, and are then eliminated by various channels from the body: all of these processes generate heat. On the other hand, the oxygen of the air, by entering, in the process of respiration, with the carbon or hydrogen of certain of the tissues or of the food, produces carbonic acid and water, and thus also heat is generated. If we estimated the potential energy of the food consumed and of the oxygen inhaled in respiration as so much heat, and also estimated, as near accuracy as possible, the amount of heat produced in the various processes above referred to, it would be found that this latter amount of heat would be less than that derivable from the food and oxygen. This deficiency is accounted for by the work done by the body, partly as internal mechanical work, such as the movements of heart and lungs, etc., and partly as external mechanical work, such as the movements of the body in the performance of the daily activities of life. This view of A. H., which is now universally adopted, was first put forward by J. R. Mayer, of Heilbronn, in 1842–1845, and numerous applications of it have since been made to many physiological and pathological phenomena.

**ANIMAL MAGNETISM** or MESMERISM is a supposed influence or emanation by means of which one person can act upon another, producing wonderful effects upon his body, and controlling his actions and thoughts. It was fancied to have some analogy to the magnetism of the loadstone, and hence its name. The term has been used to group together a multitude of manifestations deemed of a wonderful kind, and which have given rise to an amount of delusion and credulity hardly exemplified on any other subject. Electro-biology, Odyism, table-turning, spirit-rapping, table-talking, spiritualism, have been classed as only modifications of the same phenomena. The art of inducing the magnetic state, as practiced by its discoverer, Mesmer, involved the use of

apparatus—the *baguet* or magnetic tub, iron rods, etc.; but the more common means have been *passes* made by the hands of the magnetizer from the head of the “subject” or patient downward, or simply making him fix his eyes on the operator. He then generally feels a creeping sensation stealing over the surface, and shortly falls into the mesmeric sleep—a state more or less resembling somnambulism. About one person in ten is found capable of being thus affected, to a greater or less extent. While in this state, the functions of the body are liable to be much affected; the pulsations of the heart and the respiration are quickened or retarded, and the secretions altered, and that chiefly at the will of the operator; at his direction, the limbs are made rigid, or become endowed with unnatural strength; one liquid tastes as any other, and is hot or cold, sweet or bitter, as the subject is told; in short, every thought, sensation, and movement of the subject obeys the behest of the mesmerizer. According to the mesmeric theory, the nervous energy of the operator has overpowered that of the subject, as a powerful magnet does a weak one, and the two are in *rapport*, as it is termed. In some cases the mesmeric trance assumes the form of *clairvoyance*. See SOMNAMBULISM.

It has been clearly established, however, that the notion of a force of any kind whatever proceeding in such cases from a person or from a magnetizing apparatus, is a delusion. The effects, whatever they are, must have their cause somewhere else. Where it is to be looked for was indicated, though not followed up, as early as 1785, in the report of the commissioners, one of whom was Franklin, appointed by the king of France to examine the pretensions of Mesmer. They report that “on blindfolding those who seemed to be most susceptible to the influence (of this agent), all its ordinary effects were produced when nothing was done to them but when they imagined they were magnetized, while none of its effects were produced when they were really magnetized, but imagined nothing was done; that when brought under a magnetized tree (one of Mesmer’s modes of operating), nothing happened if the subjects of the experiment thought they were at a distance from the tree, while they were immediately thrown into convulsions if they believed they were near the tree, although really at a distance from it; and that, consequently, *the effects actually produced were produced purely by the imagination*.”

But this part of the science of human nature—the reflex action of the mental upon the physical—had not then been sufficiently studied, and is not now widely enough known to render the conclusion of the reporters a satisfactory explanation of the phenomena; and the fallacies of mesmerism, though subjected since to many similar exposures (Dr. Falkoner of Bath, e.g., annihilated the patent metallic tractors of Perkin, by making wooden ones exactly like them, which produced exactly the same effects), have constantly revived in some shape or other. One chief cause of the inveteracy of the delusion is, that the opponents of mesmerism do not distinguish between denying the theory of the mesmerists and the facts which that theory pretends to explain, and have been too ready to ascribe the whole to delusion and fraud. It thus happens that the most skeptical often become all of a sudden the most credulous. Finding that things do actually happen which they cannot explain, and had been accustomed to denounce as impostures, they rush to the other extreme, and embrace not only the facts but the theory, and call this, too, believing the evidence of their senses. Now, the reality of the greater part of the manifestations appealed to by the mesmerist must be admitted, though we deny his explanation of them; and even where their reality must be denied, it does not follow that the mesmerist is not sincere in believing them; there is only greater room than in any other case for suspecting that he has deceived himself.

The first to give a really scientific direction to the investigation of appearances of this class was Mr. Braid, a surgeon in Manchester (see HYPNOTISM), who detaches them altogether from the semblance of power exerted by one individual over another, or by metallic disks or magnets, and traces the whole to the brain of the subject, acted on by *suggestion*, a principle long known to psychologists, though never made so prominent as it ought to be. The subject is ably handled in a paper in the *Quarterly Review* for Sept., 1853 (said to be by Dr. Carpenter). The reviewer traces the operation of this principle through the most ordinary actions, which no one thinks wonderful, up to the most miraculous of the so-called “spiritual” manifestations.

Ideas become associated in our minds by habit or otherwise, and one being awakened brings on another, thus forming a train of thought; this is *internal suggestion*. But impressions from without originate and modify these trains, constituting *external suggestion*. While awake and in a normal condition, the *will* interferes with and directs these trains of thought, selecting some ideas to be dwelt upon, and comparing them with others and with present impressions. A comparative inactivity of this selecting and comparing faculty, leaving the flow of ideas to its spontaneous activity, produces the state of mind called *reverie* or *abstraction*. In dreaming and somnambulism, the will and judgment seem completely suspended; and under its internal suggestions the mind becomes a mere automaton, while external suggestions, if they act at all, act as upon a machine. These are well-known facts of the human constitution, and independent of mesmerism, though their bearing upon it is obvious.

Another fact of like bearing is the effect of concentrated attention on any object of thought in intensifying the impression received. This may proceed so far, in morbid states of the nervous system, that an idea or revived sensation assumes the vividness of a present impression, and overpowers the evidence of the senses. Ideas thus become

*dominant*, overriding the impressions of the outer world, and carrying themselves out into action independently of the will, and even *without the consciousness* of the individual. These dominant ideas play a greater part in human actions and beliefs than most are aware of. "Expectant attention" acts powerfully on the bodily organs, and often makes the individual see and hear what he expects to see and hear, and, without his consciousness, moves his muscles to bring it about. These, too, are recognized facts in the science of physiology and psychology (see Carpenter's *Human Physiology* and Dr. Holland's *Chapters on Mental Physiology*).

These principles enable us to bring together and explain a whole class of phenomena, reverie, dreaming, somnambulism, the inspiration of the Delphic priestess, religious ecstasies, the physical excitement attendant on "revivals" and "camp-meetings," belief in witchcraft, possession, and mania, individual and epidemic. And it is now held that the manifestations of mesmerism, electro-biology, etc., belong to the same class, and are to be accounted for in the same way.

The mesmeric state is produced by a steady gaze at some fixed object. There is no peculiar virtue in the eyes of the mesmerist or in a metallic disk, for a spot on the wall will produce the effect. The thing requisite is a monotonous and sustained concentration of the subject's will, producing weariness and vacancy of mind; and this resembles the condition that induces reverie and sleep, and leaves the mind open to any suggestion, and at the command of any idea that may be made to possess him. But that he is governed by his own ideas, and not by the will of the mesmerizer, is clear. *No wish of the mesmerizer, or of any other person, was ever known to affect the "subject" until it was conveyed to him by voice or otherwise*; while an idea suggested by putting his body in a certain posture, or by an accidental touch, has the same effect as a command. If he seems more subject to the will of the mesmerizer than of any one else, it is because he was previously impressed with that idea, and is therefore more awake to his suggestions. It is thus that the operator is enabled to play upon him as an instrument—to make him taste, feel, think, and act, and lose and recover memory, the power over his limbs, or even his own identity, as the operator dictates. We must content ourselves with thus indicating the principle of explanation, leaving to the reader to apply it in detail.

The manifestations connected with table-turning, such of them as are genuine, are explained by the operation of *expectant attention*. A number of individuals sit round a table with their hands resting upon it, having the idea in their minds that it will or may move, the *direction* of the expected movement being also agreed upon. Accordingly, if none of the party are very skeptical, it generally does move after a time, all declaring, and in perfect good faith, that they did not press. And yet it has been proved, by a contrivance of Faraday, that there always is pressure, though without the will or consciousness of the performers; and this is only what is to be looked for from the involuntary effects of a dominant idea. This explanation does not suffice for many of the wonders *related* by believers to have happened. But all such are to be received with suspicion, and that without accusing the relaters of bad faith. The very disposition to look for something out of the usual course of nature makes them incapable, for the time, of distinguishing what actually happens from what they expect to happen. The mysterious indications of the divining-rod, and of an oscillating body, such as a ring, suspended from the finger, are all to be accounted for in a similar way: they result from unintentional muscular movement.

In spirit-rapping, a "medium" puts, somehow, the questioner into communication with any departed spirit he may wish to consult, and the answer is given by raps, supposed to be made by the spirit. The questioner runs a pencil over the letters of the alphabet, and the raps are given as the pencil comes to the successive letters forming the words of the answer. Many of the "media" in this species of "spiritual" manifestation have been proved to be impostors, though it is not necessary to suppose that they are so in all cases; they may be imposing on themselves, as witches did of old. There is no doubt, however, that the wonderful revelations they sometimes made of things known only to the questioner, arose from involuntary indications made by the latter—by his pausing, without knowing it, at the letters of the expected answer. A variation on the mode of communicating with the world of spirits, consists in putting the questions to a table, which is manipulated, as in table-turning, and gives its answers by rapping with one of its feet, or by rocking, as may be agreed upon. The agency of the *expectant ideas* of the performers in these cases is apparent in their own narratives. Would it not otherwise be strange that spirits should reveal heaven to Robert Owen as organized on his own social theory, while a Protestant clergyman finds the world of spirits pervaded by a horror of the pope (Rev. E. Gillson, *Table-talking*), and to pious Scotch Presbyterians every revelation regarding it is completely in accordance with Calvinistic theology.

Such are the views of those who, in regard to this matter, may be denominated the "rationalist" party. But there is a large class of intelligent persons who hold the explanations above given to be insufficient. After making every allowance for deception, whether intentional or unintentional, they find many undoubted facts remaining which are quite beyond the scope of suggestion, dominant ideas, or any other of the usually received theories, physical or psychological. Phenomena of the character in question are, therefore, still the subject of earnest investigation on the part of many, both in Great Britain and America. See SPIRITUALISM.

**ANIMALCULE**, a term etymologically applicable to any very small animal, and limited in actual use to those which are microscopical. Animalcules exist in prodigious numbers, and of many different kinds, their size being such that multitudes of them find ample space for all the movements of an active life within a single drop of water; and they abound almost wherever there is moisture, at least wherever organic matter is present. The *monas crepusculus* of Ehrenberg is only 1-2000th part of a line, or 1-24,000th part of an inch in diameter. "Take any drop of water from the stagnant pools around us," says prof. Rymer Jones, "from our rivers, from our lakes, or from the vast ocean itself, and place it under the microscope; you will find therein countless living beings moving in all directions with considerable swiftness, apparently gifted with sagacity, for they readily elude each other in the active dance they keep up. . . . Increase the power of your glasses, and you will soon perceive, inhabiting the same drop, other animals, compared to which the former were elephantine in their dimensions, equally vivacious and equally gifted. Exhaust the art of the optician, strain your eyes to the utmost, until the aching sense refuses to perceive the little quivering movement that indicates the presence of life, and you will find that you have not exhausted nature in the descending scale." Animals belonging to different classes are, however, microscopical, and the term A. is either applied to them all with reference to their mere size, or it is restricted to those which received from Müller, with whom the scientific study and classification of them may be said to have begun, the name of *animalcula infusoria*, and which are by Cuvier made the fifth and last class, under the name *infusoria*, of his fourth great division of the animal kingdom, *radiata*. See INFUSORIA. The name *infusoria*, indeed, etymologically considered, is not more appropriate than *animalcula*, perhaps not quite so much so, as only a small proportion of the animals of this class are actually found in infusions, but it continues to be generally employed by zoologists. Attempts have been made to classify them according to their structure, and to assign them their proper places accordingly in the general arrangement of the animal kingdom; and one part of them have been formed into a class under the name *rotifera* (q.v.), regarded as probably belonging to the articulated division; another part, formed into a class called *polygastrica* (q.v.), consisting of the simpler kinds, have been in like manner somewhat doubtfully referred to the radiated division. Agassiz unhesitatingly describes the class *infusoria* as "an unnatural combination of the most heterogeneous beings." He regards many as locomotive *algæ*; and of those which are true animals, he expresses the opinion that many are merely the chrysalis states of other animals. There still remain, however, many kinds which are perfect animals.

Among the most remarkable discoveries of modern science must be reckoned that of fossil *animalcules*, in such abundance as to form the principal part of extensive strata. This discovery was made by Ehrenberg, who found the *polierschiefer* (polishing-slate or *tripoli*) of Bilin to be almost entirely composed of the silicious shields of a minute fossil A., the length of one of which is about  $\frac{1}{250}$ th of a line, so that about 23 millions of animalcules must have gone to form a cubic line, and 41,000 millions to form a cubic inch of the rock. Ehrenberg succeeded in detecting the formation of similar strata in deposits of mud at the bottom of lakes and marshes, the mud swarming with living animalcules, probably in their turn to be fossilized. The *bergmehl* or mountain meal of Sweden and other parts of Europe, which is sometimes used as an article of food, is entirely composed of the remains of animalcules; not merely, however, of their silicious shields, for it contains a considerable percentage of dry animal matter. Some animalcules prefer waters impregnated with iron, and their death gives rise to an ochreous substance, in which iron is the principal ingredient.

**ANIMALS, CRUELTY TO.** England has the honor of first making this a distinct subject of public attention by the formation of societies for its prevention, and by legislative enactments making it punishable. The movement has now extended into France and Germany.

Benevolence to A. is a result and a proof of extending civilization. It is the carrying out to its just limits the principle of sympathy, which first appears when the savage ceases to think exclusively of himself and learns to identify his tribe with himself. It is this principle of sympathy, only carried further, that, under Christianity, unites all the tribes and races of men in one family. And it only requires cultivation of the faculty of sympathy generally, and the direction of the attention to what the lower animals have in common with man—sensibility, namely, to pain—to make any one feel that needlessly to inflict that pain, is to sin against his own nature, and therefore a crime. This ought to be a special object of attention in the training of children. Besides the cruelty to beasts of burden and domestic animals arising from cupidity, many, especially children, torture creatures from thoughtlessness and ignorance. This, therefore, is one of the many instances where instruction of the head may be made to mend the heart. It deserves to be remarked that the mere extinction of life does not necessarily constitute cruelty. There is often more cruelty in prolonging the life of an animal than in taking it away. It is the infliction of needless pain or restraint that is the essence of cruelty to animals.

**ANIMALS, CRUELTY TO (in law).** This is an offense against the criminal law, and has frequently of late formed the subject of legislation, the chief act of parliament, the

12 and 13 Vict. c. 92 (passed in 1849), being that which at present regulates the law of England on the subject. By this statute it is provided that if any person shall cruelly beat, ill-treat, overdrive, abuse, or torture any horse, mare, gelding, bull, ox, cow, heifer, steer, calf, mule, ass, sheep, lamb, hog, pig, sow, goat, dog, cat, or any other domestic animal, he shall forfeit a sum not exceeding £5 for every such offense, recoverable before a justice of the peace in a summary way; and if by any such conduct he shall injure the animal, or any person or property, a further sum not exceeding £10 to the owner or person injured. The acts also inflict penalties in the case of conveying cattle by railway without water-supply, etc., causing unnecessary pain or suffering; and also in the case of bull-baiting, cock-fighting, and the like, and makes a variety of humane provisions for the regulation of the business of slaughtering horses and other cattle not intended for butcher's meat.

Formerly, in Scotland, this offense was punishable at common law—that is, according to the Scotch legal principle—common law as distinguished from *statute* law—and so late as the year 1826, a man was convicted there of affixing a stob, or prickle armed with iron nails, to the tail of a pony, by which the animal was wounded in the hind-legs; and punished with two months' imprisonment. But the Scotch law at that time did not view such conduct so much as an act of cruelty to the animal injured, as of "malicious mischief," as it was called, and, in fact, regarded such treatment of animals as simply an offense against *property*. An act of parliament, however, passed in the year 1850, puts the law on this subject in Scotland on the same footing as it is in England. The act referred to contains provisions similar to those enacted by the 12 and 13 Vict. for England; and in both acts it is declared that the word "animal" shall be taken to mean "any horse, mare, gelding, bull, ox, cow, heifer, steer, calf, mule, ass, sheep, lamb, hog, pig, sow, goat, dog, cat, or any other domestic animal."

**ANIMALS, CRUELTY TO** (*ante*). There are societies for the prevention of cruelty to animals in 33 of the 38 United States. The first society was chartered by the legislature of New York in 1866, chiefly through the efforts of Henry Bergh, who has been its president for 13 years. Its name indicates its purpose. Up to the close of 1878 it had secured prosecution in 6809 cases for working horses suffering from sores, and in nearly 1000 for cruel beating of animals. The society met with much opposition until a decision of the highest court affirmed its powers. There are 13 societies formed with this as a model in various states.

**ANIMALS, WORSHIP OF.** The practice of worshiping animals, as well as certain plants and stones, prevailed among many of the nations of antiquity, and is still common among barbarous tribes. That animals should be held sacred and receive worship, need excite no surprise when we bear in mind the origin of polytheistic worship generally. They are manifestations of power; mysterious, too, because actuated by impulses differing from those of man; and often, by their greater acuteness of sense and more unerring instincts, seeming to possess supernatural knowledge. Besides this general ground, various animals have been associated with the gods as emblems and in other ways. But a more important source of the superstitious regard bestowed on animals, is the belief that gods, and spirits in general, often take the form of animals, either temporarily or as a permanent abode. The doctrine of the transmigration of souls is not confined to India. Kindred notions, though not perhaps reduced to system and formally enunciated, are all but universal; they seem as indigenous in the heart of Africa as on the banks of the Ganges. It was as a manifestation of the soul of Osiris—originally, like all the other Egyptian deities, a sun-god—that the sacred bull Apis was worshiped in ancient Egypt. When the Spaniards first visited the coasts of South America, they found a ludicrous kind of animal-worship practiced by the natives on the coast of Cumana (Venezuela). "They held the toad to be, as they said, 'the lord of the waters,' and therefore they were very compassionate with it, and dreaded by any accident to kill a toad; though, as has been found the case with other idolaters, they were ready, in times of difficulty, to compel a favorable hearing from their pretended deities, for they were known to keep these toads with care under an earthen vessel, and to whip them with little switches when there was a scarcity of provisions and a want of rain. Another superstition worthy of note was that when they hunted down any game, before killing it they were wont to open its mouth and introduce some drops of maize-wine, in order that its soul, which they judged to be the same as that of men, might give notice to the rest of its species of the good entertainment which it had met with, and thus lead them to think that if they came too, they would participate in this kindly treatment."—*Helps*.

**ANIME**, a resin exuding from the trunk of the *hymenaea courbaril*, a large tree of the natural order *leguminosae*, sub-order *cassipineae*, a native of New Spain and Brazil. It somewhat resembles copal, but is more easily soluble in alcohol.—The name *A.*, or gum *A.*, is, however, also given in Britain to a resin called in India copal, the produce of *vateria indica*, a tree of the natural order *dipteraceae*; whilst the copal of Madagascar is produced by *hymenaea verrucosa*, and that of Brazil in great part by several species of *hymenaea*, a tree of which genus is also regarded as the probable source of the copal of Mexico.

**ANIMISM**, a term formerly applied in biology to denote the theory that the soul, *anima*, is the vital principle, the cause of the normal phenomena of life and of the abnor-

mal phenomena of disease. It is now current in the wider anthropological sense, as including "the general doctrine of souls and other spiritual beings." The absence of any other suitable word is thought to render this application indispensable, and may be conceded to render it allowable; for "spiritualism," though occasionally used in a general sense, has become associated with a particular modern development of animistic doctrine; "anthropomorphism," though less objectionable, is inadequate; while "theology" cannot be extended to include the lower forms of the doctrine of spiritual beings, and indeed many of its higher developments, except by a departure from ordinary usage. An animistic philosophy, explaining the more strange or striking of the phenomena of nature by the hypothesis of direct spiritual agency, is universally prevalent among savage races; and there seems tenable ground for the inference that it must have been the philosophy earliest developed among prehistoric societies of mankind. It is manifestly the development of that earliest analogical reasoning which imagines external objects to be conscious and animated with life essentially like our own; it is the expression and application of the first general theory of natural causes, rude and inadequate, yet marvelously self-consistent and serviceable; and its history appears to be primarily that of a dominant and pervading philosophy, applied to explain all the phenomena of nature and life, save only those ordinary sequences which the uncivilized man regards as needing no explanation; afterwards, in the progress of culture, its history is that of a system of thought modified and restricted by the increase of positive knowledge, and surviving in either greatly refined or greatly enfeebled forms. A. is one of those terms which should be used not without cautious limitation of its range. In our ignorance of the nature of the *soul* in brutes or in men, the philosophy of the soul may easily extend itself unduly, involving on one side matter, and on the other side spirit in statements whose indeterminateness will render them unsatisfactory. A., as denoting the doctrine of the soul, has no claim to decide scientific principles pertaining to either the purely spiritual or the purely material realm.

ANIONS. See ANODE.

ANISE, *Pimpinella anisum*, an annual plant of the natural order *umbellifera*. The genus *pimpinella* has compound umbels, usually without involucres. Two species are natives of Britain; they are commonly known by the name of burnet saxifrage, and have no properties of importance. A. is a native of Egypt. It is an annual plant; the stem is 1½ to 2 ft. high, dividing into several slender branches; the lower leaves roundish-heart-shaped, divided into three lobes, and deeply cut; those of the stem pinnate, with wedge-shaped leaflets. The umbels are large and loose, with yellowish-white flowers. It is much cultivated in Egypt, Syria, Malta, and Spain, and even in Germany, especially in the district around Erfurt, where a large quantity of the seed is annually produced. Attempts were made, more than 200 years ago, to cultivate it in England; but the summers are seldom warm enough to bring it to perfection. It is occasionally sown in gardens for a garnish or for seasoning. A.-seed (*aniseed*) is used as a condiment and in the preparation of liqueurs; also in medicine as a stimulant stomachic, to relieve flatulence, etc., particularly in infants; and it has been used in pulmonary affections. It has an aromatic, agreeable smell, and a warm, sweetish taste. It contains a volatile oil called *oil of A.*, which is nearly colorless, has the odor and taste of the seed, and is employed for similar purposes. One hundred-weight of seed yields about 2 lbs. of oil, which is obtained by distillation; but at Erfurt the oil is made from the stems and leaves, the whole plant being aromatic. *A.-water*—water flavored with the oil, and sugared—is much used in Italy as a cooling drink.

STAR ANISE, or CHINESE ANISE, is the fruit of *illicium anisatum*, a small tree of the natural order *magnoliacea*. See ILLICIUM. It receives its name from the star-like form of the fruit, which consists of a number (6 to 12) of hard, woody, one-seeded carpels. The tree has evergreen leaves, somewhat like those of the common laurel. The whole plant is carminative, and is used by the Chinese as a stomachic and as a spice in their cookery. The qualities of the fruit so much resemble those of the common anise, that it may be used instead of it, and by distillation it yields an oil which is very generally substituted for oil of anise, and is imported into Europe in considerable quantity to be used instead of it. Star aniseed is also imported, chiefly from China and Singapore.

ANJER', or ANJIER', a seaport of Java, on the straits of Sunda, 18 m.w. of Batavia. It is protected by a fort, and has some trade with passing vessels. Mails for Batavia are landed at A.

ANJOU, a former province in the n.w. of France, of about 3080 sq.m. in extent, now forming the department of Maine-et-Loire, and small parts of the departments of Indre-et-Loire, Mayenne, and Sarthe. Its capital was Angers. The ancient inhabitants of A. were the *Andegavi*, who long and resolutely resisted the Roman arms.—The male line of the counts of A., who took their name from it, having become extinct in 1060, their title and possessions passed by the female line to the powerful house of Gatinais; and from one of this family, Godfrey, count of A., sprung the Plantagenets. He conquered the greater part of Normandy; assumed the title of duke; and in 1127, married Matilda, the daughter of Henry I. of England, and widow of the emperor Henry V. Through her, his son inherited the English throne, which he ascended in 1154 as Henry II. A. now became one of the possessions of the kings of England; but in 1204, the French acquired

it by fortune of war; and it was bestowed as a fief upon Philip, the son of Louis VIII., and afterwards upon his brother Charles, who became the founder of that house of A. which gave kings to Naples, Sicily, and Hungary. Charles II. of Naples gave A. to his daughter Margaret on her marriage with Charles of Valois, the son of Philip IV. Her son ascended the throne of France as Philip VI. in 1328. King John, in 1360, made A. a duchy, and gave it to his son Louis, and he succeeding to the crown of Naples, it remained a possession of the kings of Naples till the overthrow of that dynasty, when René II., the last of his family, was deprived of it by Louis XI., who permanently annexed it to the French crown in 1484. Since that time, it has merely given an honorary title to princes of the royal family. The last who bore it was the grandson of Louis XIV., who became Philip V. of Spain.

**ANKARSTRÖM**, JOHN JACOB, the assassin of Gustavus III., king of Sweden, b. in 1761, the son of a lieutenant-colonel. He came very early to court, in the capacity of a page, and next entered the army; but having obtained the rank of captain, left it in 1783; married and settled in the country. He was a man of violent feelings and rough manners, and much opposed to the measures taken by the king for curtailing the power of the senate and of the nobles. Implicated in certain intrigues in the island of Gothland, he was accused of treason, but released for want of positive evidence. His hatred to the king was increased by the harsh usage he met with in the course of his trial. In 1790, he went to Stockholm, and together with gen. Pechlin, counts Horn and Ribbing, and others, planned the assassination of the king. A. begged that the execution of the deed might be left to him; but Horn and Ribbing disputing the point, they drew lots, and the lot fell upon A. In 1792, the king convoked the diet at Gefle, and the conspirators hoped upon that occasion to carry out their purpose; but being thwarted in this, they had to wait till the 15th of Mar., when Gustavus was to attend a bal masqué, during which A. shot at and mortally wounded him. He was instantly apprehended, and at once confessed his crime, stoutly denying, however, that he had any accomplices. On the 29th of April, he was condemned to death, publicly flogged for three successive days, and then beheaded. He went to the scaffold with perfect composure, rejoicing to his last moment in the success of his crime.

**ANKER**, a liquid measure once much used in north Europe, now only in Denmark and Norway. It varies in capacity; at Copenhagen it contains 9.88 U. S. gallons; at Hamburg, 9.54; at Bremen, 9.57; at Lubeck, 9.89; at Amsterdam, 10.22; at Berlin, old measure 12.45; new, 9.07 gallons.

**ANGLAM**, or ANGLAM, a t. of Prussia, in the province of Pomerania, 44 m. n.w. from Stettin, on the right bank of the Peene, and 4 m. from its mouth in the Kleine Haff. The river is navigable to A., which carries on a considerable commerce, and has long been a place of commercial importance, having been admitted into the Hanseatic League in 1319. It has manufactures of linens and woollens; it has also several breweries, soap-works, and tanneries, and ship-building is actively prosecuted. During the middle ages, A. suffered more than almost any other town from fire and pestilence; and in the wars of the 17th and 18th c., it was again and again besieged and sacked. On the close of the seven years' war, in 1762, its fortifications were happily dismantled. It is still, however, surrounded by an old wall with three gates. It contains many interesting specimens of the Hanseatic or north German architecture, very like the Flemish. Pop. '75, 11,847.

**ANKO BAR**, the capital of the kingdom of Shoa, in Abyssinia, is built 8198 ft. above the sea-level, on the ascent of the table-land, in lat. 9° 34' n., long. 39° 35' e. The higher portion of the t. is fortified in a very primitive way, by means of a palisade constructed of stakes, with intertwined branches of trees. The royal palace, unlike the most of the buildings, which are chiefly of wood, is built of stone and mortar, although the roof is thatched. The vegetation around the place is extremely rich, and the air is both cool and pure, so that A. is a very agreeable residence, and is consequently favored with the presence of the court during a portion of the year. Pop. 10,000.

**ANKWITZ**, NICOLAJ, Count, d. 1794: a Polish politician, ambassador to Copenhagen, and deputy from Cracow in the diet. In the diet which was forced to the partition of the kingdom he was deputed to sign the treaty with Russia, and immediately afterwards a large salary was conferred on him by Russia, with the appointment of president of the council. Soon after the beginning of the Kosciusko revolution he was convicted of treason, and hanged.

**ANKYLO'SIS** (Gr. *ankulosis*, bending or crooking; *ankulē*, stiff-joint) is a term used in surgery to imply a stiffness in any joint. It is usually the result of disease, which, having destroyed the articular cartilages, leaves two bony surfaces opposed to each other. The reparative powers of nature cause a union to take place by means of granulations between them. This bond of union may become osseous, so as to render the joint perfectly rigid, or it may continue membranous, allowing of a certain amount of motion. Some joints, especially the elbow, are very apt to become ankylosed; and in the knee or hip-joints, this osseous A. is reckoned the most favorable termination to disease, as the limb can then afford a rigid support for the trunk. Joints, stiff through a membranous A., may be forcibly bent, and the bond of union ruptured, so as to restore mobility, or allow of their being placed in a convenient position. A. of the joints between the ribs

and the vertebrae is common in advanced age; and there are some cases on record of universal A. of all the joints. A case occurred in 1716 of a child only twenty-three months old with all its joints thus stiffened; and there are in various museums specimens of adult bodies in this condition.

**ANN**, or **ANNAT**, in Scotch law, signifies the half-year's stipend payable for the vacant half-year after the death of a clergyman, to which his family or nearest of kin have right, under an act of the Scottish parliament passed in the year 1672. It is a right that does not belong to the clergyman himself, but to his next of kin absolutely, and therefore can neither be assigned or disposed of by him nor attached for his debts. Compare **ANNATES**.

**ANNA, SAINT**, according to tradition, was the daughter of Mathan, priest of Bethlehem, and the wife of St. Joachim. After 21 years of barrenness, she is said to have given birth to the Virgin Mary, the mother of the Savior. Nothing positive is known regarding her life; her name does not occur in the Scriptures, nor even in the writings of the fathers during the first three centuries. The first who mentions her is St. Epiphanius, in the 4th c.; but towards the 8th, she was all but universally invoked. Her body was believed to have been transferred from Palestine to Constantinople in 710 A.D.; and her head to Chartres, by Louis de Blois, about 1210 A.D. The inhabitants of Duren (duchy of Juliers, Germany) also pretend to have a head of St. A.; and a third is believed to be in possession of the church at Ursitz, in the diocese of Würzburg, although numerous other churches claim to be equally favored. The Roman Catholic church has a festival in her honor on the 26th of July; the Greek, on the 9th of Dec. In Austria, Bavaria, and other Catholic countries, this festival is one of great importance. In honor of St. A., a fraternity, called the fraternity of St. A., was instituted in the 13th c. After the reformation, it was organized anew by the Jesuits; and in modern times, has manifested some vitality in Bavaria and Catholic Switzerland.

**ANNABERG**, a t. of the kingdom of Saxony, in the district of Zwickau, on the right bank of the Sehm, 18 m. s. from Chemnitz. It is situated 1800 ft. above the level of the sea, in a mining district; the surrounding hills containing mines of silver, tin, cobalt, and iron. It has extensive manufactures of lace and of silk ribbons. The ribbon manufacture was introduced here by Protestant refugees from Belgium, who fled from the persecution carried on by the duke of Alva. Pop. '75, 11,725.

**ANNA CARLOV'NA**, regent of Russia during the minority of her son Ivan, was the daughter of Charles Leopold, duke of Mecklenburg, and of Catharine, sister of the Russian empress, Anna Ivanovna (q.v.). In 1739, she married Anthony Ulric, duke of Brunswick-Wolfenbüttel. Her son, Ivan, b. Aug. 20, 1740, was nominated by the empress Anna Ivanovna as her successor. This was done at the instigation of Biron (q.v.), the empress's favorite, whose object was to secure the regency for himself; and the empress, on her death-bed, actually appointed him regent, but he continued in power only for a short time. She d. on Oct. 28, 1740, and his overthrow took place on the 18th of Nov. in the same year. A. C. now proclaimed herself grand-duchess and regent of Russia; but she showed no capacity for managing the affairs of a great country, spent her time in indolent enjoyments, and resigned herself very much to the guidance of one of the ladies of her court, Julia von Mengden. A conspiracy was formed by a party desirous of raising to the throne Elizabeth, daughter of Peter the great and of Catharine, and this was accomplished on Dec. 6, 1741. The infant Ivan was sent to the castle of Schlüsselburg, where he was afterwards murdered; Anna and her husband were condemned to imprisonment for life, and conveyed to Cholmogory, a t. upon an island in the Dwina, near the White sea. Here she bore two children, and d. in childbed in 1745. Her husband remained a prisoner for 39 years, and d. in 1780.

**ANNA COMNE'NA**, a learned Byzantine princess, author of one of the most valuable works to be found in the collection of the Byzantine historians, was the daughter of the emperor Alexius I. (Comnenus), and was b. on Dec. 1, 1083. She received the best education that Constantinople could give, and early displayed a fondness for literary pursuits; but was also habituated from her childhood to the intrigues of the court; and during the last illness of her father, she entered into a scheme, which her mother, the empress Irene, also favored, to induce him to disinherit his eldest surviving son, John, and to bestow the diadem on her. Failing in this, she framed a conspiracy against the life of her brother (1118); and when her husband, Nicephorus Bryennius, a Byzantine nobleman, either from timidity or virtuous principle, refused to join in it, she passionately lamented that she had not been born a man, and upbraided him as having the soul of a woman. Her brother spared her life, but punished her by confiscation of her property, which, however, he soon after generously restored. Disappointed and ashamed, she withdrew from the court, and sought enjoyment in literature. On the death of her husband (1137), she retired into a convent, where she d. in 1148. Her life of her father, entitled *Annæ Comnenæ Alexiados libri 19*, is full of professions of careful inquiry and a supreme regard for truth, but "the perpetual strain of panegyric and apology awakens our jealousy." The style is characterized by an elaborate affectation of rhetoric. The best edition is that of Schopen (2 vols., 1839). See Oster's *A. Comnena* (1868-71).

**ANNA IVANOVNA**, Empress of Russia, was b. on the 8th of Feb., 1693, and was the second daughter of Ivan, the elder brother of Peter the great. She was married in 1710 to the Duke of Courland, the last of his race, who d. in the following year; and she obtained the duchy of Courland for her favorite, Biron, a Courlander of low birth. The throne of Russia was offered to her by the supreme council on the death of Peter II. in 1730, on conditions which greatly limited the power of the monarchy, but which she soon broke. Her elevation to it was very much owing to the intrigues of the chancellor Ostermann, who had had the charge of her education, but who was disappointed in finding her not grateful and tractable, as he expected. For three years, however, her rule was mild, humane, and equitable. The army was reformed, greater liberty was allowed to the landed gentry, government debts were paid up, and the poll-tax for the serfs lessened; but her paramour, Biron, having determined to govern the nation as well as the empress, a sudden and deplorable change ensued. This man, a blood-thirsty and avaricious wretch, established something like a reign of terror through the land. He is said to have banished not less than 20,000 persons to Siberia; numbers were knouted, had their tongues cut out, or were broken alive on the wheel. Eleven thousand perished in this way. Prince Basil Dolgoruki, and others of his family, suffered the ignominy of the scaffold. At length the health of the empress gave way. She d. on Oct. 28, 1740, and left the throne to her grand-nephew, Ivan, with Biron as regent. See **RUSSIA** and **BIRON**.

**ANNALS**. These were at first books which contained a record, in chronological order, of the principal events occurring in one or more years. The name is derived from the oldest historical documents of the Romans, the *Annales Pontificum*, or *Annales Maximi*, the duty of drawing up which devolved upon the *Pontifex Maximus*; but these were all destroyed by the Gauls at the sack of Rome, some hundreds of years before the time of Christ. After the second Punic war, A. similar to the former ones were composed, not, however, by the priests, but by educated members of the Roman laity, such as Fabius Pictor, Calpurnius Piso, etc. At a still later period, the term was applied to any historical work that followed the order of time in its narrations, separating them off into single years—as, for instance, the *Annals* of Tacitus.

**ANNAM**. See **ANAM**, *ante*.

**ANNAMABOE**, a small seaport t., protected by a strong British fort, on the gold coast of Africa, in lat. 5° 5' n., long. 1° 5' w., 10 m. e. of Cape Coast Castle. In 1807, the inhabitants took part with the Fantees against the Ashantees, in consequence of which the t. was attacked by an overwhelming force of the latter, and most of the inhabitants were slain. There is little trade in anything but gold. The present population is between 4000 and 5000.

**ANNAT**, a seaport, and royal and parliamentary burgh, in the co. of Dumfries, on the river of the same name, near its entrance into the Solway firth. It is neat and well built; among the chief industries are tanning and bacon-curing. The river, which affords excellent salmon-fishing, is spanned by a bridge of three arches, and is navigable to within half a mile of the t. for vessels of 250 tons; while considerably larger vessels can enter the mouth of the river, half a mile below. There is regular communication by steamers with Liverpool and Whitehaven; and the Glasgow and Southwestern and Caledonian railways connect the town with Edinburgh, Glasgow, and Carlisle. The burgh unites with Dumfries, etc., in returning one member to parliament. Pop. in '71, 4681.

**ANNANDALE**. See **DUMFRIESSHIRE**.

**ANNAPOLIS**, a co. in w. Nova Scotia, on the bay of Fundy; 1700 sq. m.; pop. '71, 18,121. The surface is varied, but generally rough, and well adapted to fruit culture. Agriculture is the main business, and dairy products are exported. There are also valuable deposits of iron ore. Capital, Annapolis, formerly Port Royal.

**ANNAPOLIS**, a seaport of Nova Scotia, in lat. 44° 40' n. Pop. '71, 2127. It stands on a river of the same name that runs into the bay of Fundy. Its harbor is excellent, though somewhat difficult of access. A. is the oldest European settlement to the n. of the gulf of Mexico, having been established, in 1604, by the French as the capital of their province of Acadia, under the name of Port Royal. Acadia having been conquered by the English in 1710, and ceded by the French in 1713, Port Royal changed its name in honor of queen Anne, continuing to be the seat of government till, in 1750, it was superseded by the newly founded city of Halifax on the outside coast of the peninsula—the new capital, with its better position and superior haven, having diverted most of the trade of the place. Since then, A. has rather decayed than otherwise; and it would have done so more decidedly, had not its river been navigable for boats during nearly the whole of its course of 70 miles.

**ANNAPOLIS**, a city and port of entry, founded in 1649, the capital of Maryland, U. S., and of the co. of Anne Arundel. It stands on the s. bank of the river Severn, 2 m. from its entrance into Chesapeake bay, and 37 m. e. by n. of Washington, 30 m. s. by e. of Baltimore—lat. 38° 58' 50" n., long. 76° 29' w. The A. and Elkridge railway, 21 m. long, connects the port with Baltimore and Washington. A. contains an imposing state-house, a bank, and six churches. It is the seat of St. John's college, and

a naval academy, established in 1845, supported by the U. S. government. Three newspapers are supported by the citizens. Pop. '80, 6700.

**ANN ARBOR**, a flourishing city of Michigan, capital of the co. Washtenaw, on the Huron river and Michigan Central railway, 38 m. w. of Detroit. The state university, founded 1837, is attended by nearly 1000 students. It possesses a library of 6000 volumes, an astronomical observatory, and a capital chemical laboratory. The three colleges, literary, law, and medical, are well attended. The city has an active trade, and contains manufactories of wool, iron, plows, and flour. There are in it 10 churches and 6 school-houses; also 5 mineral springs, a hydropathic establishment, and 4 weekly newspapers. Pop. '80, 8095.

**ANNARR'**, or **ONARR**, in Norse mythology, the husband of night, and father of Jord (the earth).

**ANNATES**, or **FIRST FRUITS**, in the ecclesiastical law of England, means the value of every spiritual living for a whole year (hence the name from the Latin word *annus*, a year), which the pope, claiming the disposition of every spiritual benefice within Christendom, reserved out of every living. This impost was at first only levied from persons appointed to bishoprics; but it was afterwards extended to the inferior clergy. The value of these A. was calculated according to a rate made under the direction of pope Innocent IV. (1253 A.D.), but which was afterwards increased by pope Nicholas III. (1292 A.D.). The valuation of pope Nicholas is still preserved in the exchequer. This papal exaction was abolished by the act 25 Henry VIII. c. 20, and by an act passed in the following year of the same reign (26 Henry VIII. c. 3) the right to A. or first fruits was annexed to the crown. The various statutes subsequently passed on this subject have all been consolidated by an act (the 1 Vict. c. 20) regulating the collection of the moneys so levied. See **FIRST FRUITS**, **QUEEN ANNE'S BOUNTY**.

**ANNATTO**. See **ARNOTTO**.

**ANNE**, Queen of Great Britain and Ireland, and the last British sovereign of the house of Stuart, was b. at Twickenham, near London, on 6th Feb., 1664. She was the second daughter of James II. of England, and VII. of Scotland (who at the time of her birth was duke of York), by his first wife, Anne Hyde, the daughter of the famous Clarendon. When she was about seven years of age, her mother died; and her father soon after professed himself a member of the church of Rome; but he permitted his daughters to be educated in the principles of the church of England, to which A. always retained an ardent if not a very enlightened attachment—seldom manifesting, in the whole course of her life, so much resolution and independence of mind as in her resistance to the attempts of her father, after his accession to the throne, to induce her to join the church of Rome, accompanied, as these were, with the offer that she should be preferred in the succession to her sister Mary. To advance his own popularity, her father gave her in marriage, in 1684, to Prince George of Denmark, brother of Christian V., an indolent and good-natured man, who concerned himself little about public affairs, and was endowed with no capacity for taking part in them. A.'s own weakness of character and that of her husband gave opportunity to lady Churchill, afterwards duchess of Marlborough, her early playfellow, to acquire an influence over her which, during many years, was almost supreme and absolute. During the reign of her father, A. lived in retirement, taking no part in politics. On the landing of the prince of Orange, she seems at first to have hesitated, and even to have been inclined to adhere to the cause of her father, whose favorite daughter she was; but lord Churchill had made up his mind to an opposite course, and his wife induced the princess to adopt it. She consented to the act by which the throne was secured to the prince of Orange in the event of his surviving her sister Mary; but quarreled with her sister about questions of etiquette, and was afterwards drawn into intrigues in which the Churchills were engaged, for the restoration of her father, or to secure the succession of the throne to his son. She even entered into a secret correspondence with her father. She was herself childless when, on the death of William III., on 8th Mar., 1702, she succeeded to the throne. She bore, indeed, 17 children; but only one, the duke of Gloucester, survived infancy, and he d. in 1700, at the age of 11. The influence of Marlborough and his wife was most powerfully felt in all public affairs during the greater part of her reign. The strife of parties was extremely violent, and political complications were increased by the queen's anxiety to secure the succession for her brother. In so far as she had any political principles, they were opposed to that constitutional liberty of which her own occupancy of the throne was a sort of symbol, and favorable to absolute government and the assertion of royal prerogative according to the traditions of her family. These principles, and her family attachment, tended to alienate her from the Marlboroughs, whose policy, from the time of her accession, had become adverse to Jacobitism, and who now, along with Godolphin, were at the head of the whig party. The duchess also offended the queen by presuming too boldly and haughtily upon the power which she had so long possessed. A. found a new favorite in Mrs. Masham, a relation of the duchess, whom she herself had introduced into the royal household. To Mrs. Masham's influence the change of government in 1710 was in a great measure owing, when the whigs were cast out, and the tories came into office, Harley (afterwards earl of Oxford) and St. John (lord Bolingbroke) becoming

the leaders of the ministry. But, although concurring more or less in the queen's design to secure the succession of the throne to her brother, the new ministers had quarrels among themselves which prevented its successful prosecution, and it oozed out sufficiently to alarm the nation, and to alienate many of their political supporters. A dispute between Oxford and Mrs. Masham, carried on for hours in the queen's presence, and which terminated in her demanding his instant resignation, seems to have brought on the attack of apoplexy of which she died, 1st Aug., 1714. The elector of Hanover succeeded her as George I.—The public events of her reign belong to the history of Britain; but the union of England and Scotland, in 1707, may be mentioned in its personal relation to herself, as she was the last sovereign who reigned over these as separate kingdoms, and the first sovereign styled of Great Britain.—Queen A. was of middle size, and comely, though not beautiful. She was virtuous, conscientious, and affectionate, more worthy of esteem as a woman than of admiration as a queen. Her reign is often mentioned as a period rendered illustrious by some of the greatest names, both in literature and science, which her country has ever produced; but literature and science owed little to her active encouragement.

**ANNEALING** is the process of tempering resorted to in the manufacture of glass and the preparation of several of the metals, whereby these substances acquire a hardness combined with tenacity which renders them much stronger, and consequently more durable. In the making of glass vessels by the glass-blower, they are of course quickly reduced in temperature whilst the fused glass is being modeled into the desired shape. The atoms of the glass thus rapidly compelled to assume a position, do not seem to be properly and firmly arranged together, and the vessel is very liable to be broken, either by a slight but smart blow, or a sudden increase or decrease in temperature. This brittleness is very observable in the *lacrymæ vitreæ*, or glass tears, known as *Prince Rupert's drops*, obtained by allowing molten glass to fall into water, when the glass forms pear-shaped drops, which are so brittle that if they be scratched with a file or the end be broken off, the whole bursts asunder and falls down into a fine powder of glass. The same brittleness is exhibited in *Bologna jars*, or *vials*, which are small and very thick in the glass; and yet, if a minute angular fragment of any hard substance be dropped into the jar, the latter flies to pieces.

In the A. of glass vessels, they are arranged in iron trays, and placed in a long oven, where they are gradually raised in temperature to near their fusing-point, by the trays being drawn along to the hottest part of the oven; and thereafter, the trays, with their contents, are very slowly drawn into a cooler and cooler part, till they become cold. The A. operation generally takes 12 hours for small articles such as wine-glasses; but days, and even a week or two, are required to anneal completely large vessels. Many articles of glass, such as tubes for steam-gauges, lamp-glasses, etc., are annealed by being immersed in cold water, which is very gradually raised to its boiling-point, and thereafter cooled.

The metals are often subjected to the process of A. When medals are repeatedly struck by the die-stamper, the gold or other metal, by the concussion, becomes brittle, and requires to be now and again heated and annealed. In wire-drawing, also, the metal becomes so hard and brittle that it requires A. to prevent its breaking into short lengths. Boiler-plates, which have been drawn out by rolling, require to be annealed before they are riveted together. The brazier, in hammering out copper and brass vessels, must stop now and again, and anneal the metal. Articles of tin, lead, and zinc can be annealed in boiling water. The tempering of steel is just a process of A. The steel is placed in an oil-bath, or surrounded by a metallic mixture which has a low fusing-point; and according to the temperature to which it is subjected, a steel with various degrees of softness and strength is obtained. Parke's table of metallic mixtures capable of being used in the tempering or A. of instruments made from steel, is as follows:

	ALLOY.		Fusing-point ° F.
	Lead.	Tin.	
Lancets.....	7 parts	4 parts	420°
Razors.....	8 "	4 "	442
Penknives.....	8½ "	4 "	450
" large.....	10 "	4 "	470
Scissors, shears.....	14 "	4 "	490
Axes, plane irons.....	19 "	4 "	500
Table-knives.....	30 "	4 "	530
Watch-springs, swords.....	48 "	4 "	550
Large springs, augers.....	100 "	4 "	558

The theory of A. is very imperfectly understood. A certain rearrangement of the atoms of the glass or metal no doubt takes place, and an absorption of heat occurs. It is possible that as the crystalline structure is indicative of brittleness, and the fibrous texture characteristic of strength, that the passage of glass or metal from a brittle to a non-brittle material may be due to the development of a fibrous structure, where a crystalline one was originally present.

**ANNE ARUNDEL**, a co. in Maryland; 750 sq.m.; pop. '70, 24,457—17,733 colored. It is watered by the South and Severn rivers. The surface is hilly, and the soil fertile, producing wheat, corn, tobacco, etc. Coal and iron are found. Co. seat, Annapolis, which is also the capital of the state.

**ANNE BOLEYN**, or **BULEN**, or **BOULEYNE**, one of the wives of Henry VIII., and mother of queen Elizabeth. The date of her birth is uncertain, 1500 to 1507 being given, but the earlier is most likely. She was beheaded, May 19, 1536. A. was a daughter of Sir Thomas Boleyn, who was viscount Rochford, and earl of Ormond and Wiltshire. She was one of the ladies chosen to accompany princess Mary when she went to France in 1514 to wed Louis XII. After the death of Louis, Mary returned to England, but A. remained in the household of Claude, queen of Francis I. She was recalled to England in 1522, or 1527, and admitted to the household of Catherine of Aragon, where she seems to have been circumspect, witty, and vivacious. Near the end of 1527, Henry declared to Wolsey his intention to marry her as soon as a divorce from Catherine could be obtained. After five years of effort the divorce came, but before this, Jan. 25, 1533, Henry and A. were married. The divorce was secured in May, and on the first of June, A.'s coronation took place. Three months later the princess Elizabeth was born. A. led an easy life for a few years, until Henry fixed his eyes on Jane Seymour, when it was not at all difficult to prove A. dissolute with a view of putting her out of the way. A committee of lords, one of them her own father, in 1536 reported her incontinent with half a dozen persons, including her own brother. She was of course convicted, degraded, and executed; but on the scaffold she behaved with dignity and courage, protesting her innocence to the last. In the strange lack of authentic details of A.'s history, especially in regard to her alleged crimes, there has been room for differences of opinion concerning her among historians.

**ANNECY**, a t. of the dep. of Haute Savoie, France, at the n.w. extremity of the lake of Annecy, and 21 m. s. from Geneva. The lake of Annecy is 1426 ft. above the sea, and is surrounded by magnificent mountain scenery. It is about 9 m. long and 2 m. broad. Its waters flow by the Fieran to the Rhone. In the 12th c. A. was called *Anneticum novum*, to distinguish it from old A., *Anneticum vetus*, which occupied the slopes of a neighboring hill, and was a place of some consequence in the times of the Romans. In the earlier part of the middle ages, A. belonged to the counts of Geneva, and on the extinction of that house, it passed to the house of Savoy, in whose possession it remained, except for a brief period under the French empire, until the transference of Savoy to France in 1860. It has manufactures of linens, cotton-yarn, glass, sulphuric acid, and steel-ware. Its linen bleachfields have subsisted since 1650. The town is clean, and has an air of respectable antiquity. The shops in many of the streets are under arcades. The most remarkable buildings are the château, once the residence of the family of Genevois-Nemours, the old bishop's palace, the cathedral, and the modern church of St. Francis, the latter of which boasts of possessing the relics of St. Francis of Sales and La Mère Chantal. Pop. '76, 10,630.

**ANNELIDA**, or **ANNELIDES** (from Lat. *annulus*, a ring), a small class of articulated animals, mostly included by Linnaeus in his class *vermes*. They have a more or less elongated body, which is always composed of numerous rings. The first of these rings assumes, in most of them, the characters of a head, but in some there is no proper head. They have no articulated limbs, but most of them are provided with bristles and hairs, often in numerous bundles, which are of use to them in locomotion; some, which want these, are furnished with suckers at the extremities, and employ them for this purpose; some remain fixed in one place. Their bodies are always soft, and without external or internal skeleton; but some of them form for themselves a calcareous covering by exudation, others form coverings partly by exudation and partly by agglutination. Their blood is generally red, but not from red corpuscles, as in the vertebrate animals; sometimes it is greenish or yellowish. Their nervous system is simple. Many of them have eyes, and many have tentacula. Most of them live in water, and of these the greater part inhabit the sea. Those which live in water breathe by gills, which are variously formed and placed; some which are terrestrial, as earthworms, have, instead of gills, numerous small respiratory sacks. They are all hermaphrodite; most of them, however, requiring mutual fecundation, and most of them are oviparous. They feed in general upon other animals, and some of them live by sucking blood. They are now divided into four orders: 1. *Dorsibranchiata*, having gill-tufts disposed regularly along the body, and composed of animals of comparatively active habits; 2. *Tubicola*, having gill-tufts near the head, and provided with shelly or other coverings; 3. *Terrestrialia*, destitute of all external appendages except minute bristles, and breathing by respiratory sacs; 4. *Suctorina*, destitute even of bristles, and provided with suckers.

**ANNE OF AUSTRIA**, daughter of Philip II. of Spain, was b. in 1602, and in 1615 became the wife of Louis XIII. of France. The marriage was so far from being a happy one, that the royal pair lived for 23 years in a state of virtual separation—a result due chiefly to the influence of cardinal Richelieu, whose fixed determination to humble the house of Austria, led him to spare no means for alienating the affection of Louis from his queen, by representing her as ever involved in the most dangerous conspiracies against his authority. The naturally grave and phlegmatic disposition of the queen was not

calculated to counteract the hostile influence of the great minister. On the death of the king in 1643, A. became queen-regent, and evinced her discernment by choosing as her minister cardinal Mazarin, by whose able management the young king (Louis XIV.) came, on attaining his majority, into possession of a throne firmly established on the ruins of contending parties. The character of A. had much influence in molding that of her son. She displayed the same cold and haughty temper, combined with the power to charm by a condescending grace, the same love of pomp and power, and the same skill in the choice of able instruments, thus compensating for the want of genuine personal greatness. She died in 1666. Two curious personal peculiarities of this queen are mentioned by biographers—her antipathy to roses, so strong that while passionately fond of flowers and perfumes, she could not endure even the picture of a rose; and the extraordinary delicacy of her skin, which made Mazarin remark, that "if her majesty were condemned to the infernal regions, her hell would be to sleep in brown holland."

ANNE OF BRITTANY, Queen of France, 1476-1514; daughter and heiress of Francis II., duke of Brittany. She received that duchy as her dowry on marrying Charles VIII., Dec. 6, 1491, Brittany then becoming incorporated with France. She had been affianced to Maximilian of Austria, but Louis XI., her guardian, forbade the marriage, and thus assured the aggrandizement of his kingdom and family. After her husband's death she married his successor, Louis XII., over whom she had great influence, and she administered the kingdom with ability during his campaigns in Italy.

ANNE OF CLEVES, 1515-57; fourth wife of Henry VIII., of England, daughter of John, duke of Cleves. Henry wedded her reluctantly to make friends among the Protestant German princes, Jan. 6, 1540; but he divorced her in July of that year, giving her an annuity of £3000.

ANNEKE JANS. See BOGARDUS, EVERARDUS.

ANNESLEY, ARTHUR. See ANGLESEA, Earl of, *ante*.

ANNIHILATIONISM, the theory of the utter extinction of man's being, both bodily and spiritual, either at death or at some later period. Little was heard of the doctrine until in the last century, when Taylor, of Norwich, England, McKnight, and a few others wrote upon it. Among later supporters perhaps archbishop Whately may be counted; for in his *View of the Scripture Revelations Concerning a Future State*, he says that in the passages in which "death," "destruction," "eternal death," are spoken of, the words may be taken as signifying literal death, real destruction, the utter end of things; that "unquenchable fire" may mean a fire that quite consumes what it feeds upon, and the "worm that dieth not" may be that which entirely devours its prey. In the United States, the question was revived about 25 years ago by *Six Sermons on the Question, are the Wicked Immortal*, by George Storrs. Just before these appeared, Dr. McCulloch, in his *Analytical Investigations concerning the Scripture*, maintained that after the final decisions at the judgment the wicked will be utterly destroyed by the visitation of God in wrath. Hudson, in *Debt and Grace, as Related to the Doctrine of a Future State*, denies that the natural immortality of the soul is ever expressed or even implied in the Bible; on the contrary, life and immortality are brought to the redeemed alone; all others being not only naturally mortal, soul and body, at death, but, after that mortal suspension of positive existence, all are raised at the final resurrection and cast into the lake of fire at the second death. He denies that endless conscious suffering is ever affirmed to be the nature of future penalty, but affirms that the penalty consists in privation, and that in the perpetuity of this privation consists the eternity of future punishment. The scripture terms, from which eternal misery is usually understood, such terms as "condemnation," "destruction," "perdition," "damnation," etc., he thinks express the painful and penal consignment of the entire nature to disorganization and to the complete non-existence from which it originally came. Mr. Landis replies to Hudson, in his treatise *On the Immortality of the Soul and the Final Condition of the Wicked*, and many other writers have discussed the subject, especially in religious reviews and magazines.

It is significant that those who hold to this theory of late prefer to use instead of A. the term "conditional immortality." Three considerations may be noted as bearing on this subject: 1. The theory of man's tripartite nature, body, soul, and spirit, may be so held as to admit as possible a literal destruction (i.e. de-structuralization) of man, an utter and final disorganization, wherein body and soul, as forming man's organized existence, might cease to be, while the spirit, or the inmost essence of his being, might remain forever disembodied and disorganized; and thence might fitly be spoken of as "cast out into the outer darkness" and swallowed up in "the bottomless pit." 2. To establish the doctrine of entire extinction of a being like a man, existing in various departments, whether two or three, it is necessary that the origin of his complex being be understood. Was he created out of nothing, or out of somewhat previously existing, or out of God as a child out of parents? 3. The theory of A. requires that the word "death" in the Bible, and in science, be taken to mean, when literally used, extinction of being. Thus the question arises whether the Bible gives "death" any meaning beyond destruction of the organism; and whether science can assure us that death in any case is more than dissolution of the organism, or destruction, i.e. de-structuralization. In the lack of affirmative answer on these points from either science or revelation, it would be found difficult to prove the theory of A., even were it true.

**ANNIUS OF VITERBO** (GIOVANNI NANNI), 1432-1502; an Italian Dominican, a favorite of pope Alexander VI. and of that family; yet his death is thought to have been caused by poison, under command of Caesar Borgia, who was offended with A.'s plainness of speech. He published a spurious work pretending to be the writings of ancient authors whose books are lost.

**ANNOBON**, or **ANNABON**, an island in the gulf of Guinea, about  $1\frac{1}{2}^{\circ}$  s. of the equator, and belonging to Spain. Its basaltic, trachytic, and volcanic mountains render A. picturesque. It has an area of 6 sq.m., and a pop. of about 3000.

**ANNONAY** (anc. *Annoneum* or *Annoniacum*), a t. of the dep. of Ardèche, France, at the junction of the Deaume with the Cance, which unite in the center of the t., 37 m. s. from Lyon. It is an active and prosperous manufacturing town, the chief manufacture being that of paper, of which 300,000 reams are produced annually. There are also manufactures of glove-leather, mostly from kid skins, and of silk and cotton twist, and woolen cloth. The paper-mills of A. were established by the father of the celebrated aeronauts, Montgolfier (q.v.), who were born here, and to whom there is a monument in the Grande Place. The situation of the town is picturesque and remarkable; the houses are placed among rocks, and some of the streets are very steep. A large quantity of silk is produced in the neighborhood. Pop. '76, 13,738.

**ANNUAL**, in botany, a term employed to denote that the duration of the life of a plant is limited to a single year; within which the germination of the seed, all the functions of vegetation, the ripening of new seed, and the death of the plant, are included. The whole duration of life in the plants thus designated is indeed generally much less than a year, and in temperate and cold climates, falls within the brief period of the summer months. They as well as the plants generally called biennial, produce flowers and fruit only once. Some species are generally A., and others generally biennial; but whether an individual plant is A. or biennial, often depends upon the accidental circumstance of the season at which the seed germinates, and may therefore be artificially determined by the time of sowing. Peculiar circumstances also sometimes convert A. into biennial, or even perennial plants; and those which are mere annuals in one climate, are perennial, or even shrubby, in another, of which the castor-oil plant affords a notable example. Most kinds of corn are the produce of A. grasses; some of which, however, as wheat, in certain circumstances, prove of longer duration. The *annuals* cultivated in our flower-gardens are very numerous; and many species, both native and foreign, are among our most beautiful flowers.

**ANNUAL REGISTER**. The first volume of the useful work which bears this name appeared in 1739. Various publications of a similar character had previously existed, such as Boyer's *Political State of Europe*, which was published in monthly numbers and yearly volumes from 1711 to 1739; and the *Historical Register*, a quarterly publication, begun in 1716, and concluded in 1738. The *A. R.* differed from these in being published once a year, in containing a more full and able historical narrative, and in the addition of a literary and miscellaneous department, including notices of new books. The undertaking was projected by Robert Dodsley, the bookseller, assisted by Edmund Burke, who for some years wrote the historical narrative, and assisted to some extent in the preparation of the *Register* during most of the subsequent part of his life. Indexes to the work have been published at various periods, and the work still goes on under the publishing care of Messrs. Rivington. A rival work, entitled *The New A. R.*, was started in 1781 by Dr. Kippis. It was edited after his death by Dr. Morgan, and came to a close in 1825. The *Edinburgh A. R.* was commenced in 1808, and terminated in 1827. The historical narrative was for some years written by Sir Walter Scott, and afterwards, for a considerable time, by Southey. A similar work was commenced at Paris in 1818, under the title of *Annuaire Historique*, and continued till 1849. The earlier volumes were compiled with much care, but latterly the work fell off. Its place was supplied by the *Annuaire des Deux Mondes*, a publication connected with the well-known review of that name. The *American A. R.* is published at New York.

**ANNUALS**, the name given to a class of pleasant and graceful publications, which for some years enjoyed an extraordinary amount of public favor, intended for Christmas, New Year, and birthday presents, in imitation of the gift-books so popular among the Germans. They were illustrated by exquisitely engraved prints, from paintings by artists of the highest talent, and contained prose and poetry by most of the best writers of the day. The first of them, the *Forget-me-not*, edited by Frederick Shoberl, was begun in London in 1822. The idea, and even the title, were adopted from Germany by the Messrs. Ackermann, the London publishers. The following year, two others made their appearance—*Friendship's Offering*, published by Smith and Elder, which had for successive editors, Mr. T. K. Hervey, Mr. Pote, Mr. Thomas Pringle, Mr. W. H. Ainsworth, and Mr. Leitch Ritchie; and the *Graces*, containing a series of elegant poems on the months by the Rev. Dr. Croly. All three, in addition to their literary and pictorial contents, had at first the blank paper for memoranda, cash accounts, etc., which were customary in the gift pocket-books of previous times. The *Literary Souvenir*, commenced in 1824 by Mr. Alaric A. Watts, was the first to discard these, and to exhibit a

vast improvement on this class of embellished works. Thenceforth, the several publishers vied with each other in their efforts to render their respective A., every succeeding year, more and more attractive. The *Literary Souvenir* was followed by the *Amulet*, started by Mr. S. C. Hall, and edited by his wife; the *Winter's Wreath*, a provincial annual; and the *Keepsake*, the latter commenced in 1827 by Mr. Charles Heath, an eminent engraver. Up to this time, the price of all the A. was 12s. each: the *Keepsake*, however, was published at a guinea. Its first editor was Mr. W. H. Ainsworth. The following year, the editorship was offered to Sir Walter Scott, with a salary of £800, and payment besides for his contributions to its pages, but was declined by him. It was then placed under the charge of Mr. F. M. Reynolds, who continued to superintend it for many years. The *Keepsake* always maintained a high aristocratic character, the contributors preferred being those who could boast a title. In 1840, it came out under the editorship of lady Emmeline Stuart Wortley. It was afterwards edited by the countess of Blessington. So popular did the A. become, that in 1829 no fewer than 17 were published. In 1840, the number had dwindled to 9. The *Book of Beauty*, long one of the best of the series, was begun in 1833 by Mr. Charles Heath. The first volume was written by Miss Landon (L. E. L.), the engravings being principally after drawings by Frank Stone. The volume for 1834 was placed under the editorship of the countess of Blessington, who conducted it to the close of her life. Mr. Heath had also the *Picturesque Annual*, and the *Children of the Nobility*—the latter commenced in 1838. The *Juvenile Album*, an annual for children, was published by the Messrs. Ackermann. Scientific A. also made their appearance, and the musical world had its *Musical Bijou*. Thomas Hood started the *Comic Annual*; and among other popular publications of the class were Fisher's *Drawing-room Scrap-book*, edited at first by Miss Landon, afterwards by Mrs. Howitt, and latterly by the honorable Mrs. Norton; and Fisher's *Juvenile Scrap-book*, edited by Mrs. Ellis; the *Oriental Annual*, the *Historical Annual*, and the *Gift and Token*, American productions. At first, the A. were all bound up in tinted paper, and inclosed in a case; but competition produced a great improvement in their external appearance, as well as in their inside attractions. Paper gave place to silk; then followed morocco bindings, and afterwards velvet. The sums of money expended on the several departments were enormous. Mr. Heath's outlay for the literary portion alone of the second volume of the *Keepsake* amounted to no less than £1600. Of this sum, Sir Walter Scott received £500 for the liberty of printing in it his juvenile drama of the *House of Aspen*, *Aunt Margaret's Mirror*, and two other little tales. To many engravers, the illustrations formed almost their sole employment. Sums varying from 20 to 150 guineas were paid to artists for the loan of pictures for engravings, of the size of 4 in. by 3; and engravers frequently received 150 guineas for the production of one plate. For several years, nearly £100,000 per annum was expended on the production of the A., and 150,000 copies of them were yearly sold. The sale of the *Forget-me-not* alone was at one time 20,000 copies. In their most flourishing period, a calculation of their expenses and profits was made, which may be here quoted. For 150,000 volumes, including the guinea-books, of which there were always two or three, the public paid about £90,000, thus distributed: Authors and editors, £6000; painters, £3000; engravers, £12,000; copperplate printers, £4000; printers, £3500; paper-makers, £5500; binders, £9000; silk manufacturers and leather-sellers, £4000; advertising, etc., £2000; incidental expenses, £1000; publishers' profits, £10,000; retail booksellers' profits, £30,000—total, £90,000.

After 1840, the demand for the A. began to decline. At the best, there had been a sickly sentimentalism in the bulk of their articles; and at all events, this class of works had been mainly addressed to the refined and affluent. Better tastes in literature now began to prevail, and there was a feeling that A. had had their day. Deserted by public favor, the character both of their engravings and their literary contents became greatly deteriorated, and they ceased to have any attraction, either as literary productions or works of art. Publishers no longer found them safe speculations, and gradually discontinued them. They dropped out, one by one, like spent stars, from the literary firmament. The *Literary Souvenir* had been discontinued in 1834, after the publication of 10 volumes. The *Forget-me-not*, the first in the field, saw its 22d year. The *Book of Beauty* and the *Keepsake* were the last of their race. The latter, on the death of the countess of Blessington, was placed under the editorship of her niece, Miss Power. The *Keepsake* of 1856, the engravings in which were under the superintendence of Mr. F. Heath, was the only relic of the past; and in that year it ceased to exist.

**ANNUITY**, from the Latin *annus*, a year, is a sum of money paid annually. The term, in its full meaning, expresses an obligation on one party to pay, and a right in another to receive the amount. The different kinds of annuities that may exist are as various as the conditions and fancies of those concerned in them; and it is impossible to define them all. An A. may be for the life of any person, however long that may be, becoming extinguished only by his death. It may be perpetual, so that as each enjoyer of it dies, his heirs may succeed to it. It may be on the life of the survivor of any number of persons—for instance, a father may leave to his five daughters an A. of £500 a year from his estate, to be enjoyed by the latest survivor, so that while the five are alive, they have £100 each; after the first death among them, the lapsed share is distributed among the survivors, giving them £125 each; and so on, the last survivor enjoying the whole £500. On the other hand, each might have a separate A. terminat

ing at her death; and again, instead of either of these simple arrangements, there might be, and often is, a more complex adjustment, giving the survivors on each death a certain proportion only of the deceased's A. An A. may begin immediately, and stop on a contingency, such as the death of a person to whom the annuitant is heir. It may be "deferred," so as to begin to be payable only after the lapse of so many years; and then it may either be payable absolutely in perpetuity, or for a given number of years, or it may be payable to an annuitant only for the remaining years of his life, if he survive the contingency.

It will thus be seen that there is infinite variety in the nature of annuities, and consequently, in the calculations regarding them. The fixed elements of such calculations, independently of this variety, are in themselves double, being vital statistics, and the profit or interest of money. As to the former, they can only apply, of course, to the adjustment of annuities on a large scale. If a person should sell a single A.—that is to say, engage for a sum down to pay a certain person an A. for life—no study of vital statistics could make his bargain other than a chance; and though he went on the most approved tables, it might occur either that the annuitant dies immediately, leaving the whole purchase-money as his profit, or that the annuitant lives to extreme old age, and renders him a great loser by the bargain. But on a large, and especially on a national scale, the rate of mortality and the value of life may be so nicely rendered in statistics, that a market may be opened for the purchase and sale of annuities at their exact value—that is to say, at such a rate that the sum paid in from time to time by persons purchasing annuities, shall just serve to pay each annuitant's annual claim. Such vital statistics, however, can only be obtained through a very accurate and long-continued registration of births, deaths, and marriages (q.v.); and it is known that the government having adjusted the price of annuities by the celebrated Northampton tables, contracted a losing bargain with their annuitants as a body, and, without being conscious of it until afterwards, sacrificed a considerable amount of public money.

The second element, besides vital statistics, in the calculation of annuities, is the profit or interest of money. If this did not require to be considered, an A. of £1 a year for 10 years would just cost £10. But while paying the A., the person who has engaged for it is drawing the interest of the money. If he sold an A. of £1 a year for 10 years for £10, he would be drawing the interest of £10 for the first year, £9 for the second, and so on; and the annuitant's bargain would be to a like extent disadvantageous. As the interest of money may be various, so may this element of the calculation of an A.; and to calculate it with reference to future indefinite variations, is of course impossible. It will be seen at once that when the variety of kinds of A. have to be adjusted to different rates of profit, an immense field is opened for calculation. It is, in fact, a province of algebraic science in which several men have achieved reputations.

The interest, as it is termed, of the national debt is virtually a multitude of perpetual annuities. In a country where there is so much superabundant wealth, there is so vast an amount of capital for which people only want interest, that although the lenders of the money are not repaid by the government, yet when any one has invested in the funds, if he wants his money back, he is sure to find a person to take his place at something near to the price paid by him. This would not be the case were the quantity of these annuities in the market disproportioned to the number desiring to invest in them, and hence it is that when there is depression of trade, and money wanted to meet obligations, the funds fall. The government have the largest field of operation, and therefore it is natural to infer that their annuities are more closely adjusted to their actual value than those of insurance companies and other parties dealing in annuities can be. It may be mentioned, however, that, for the encouragement of the working classes to save and provide for old age and contingencies, government, through the savings-banks, grants small annuities on terms advantageous to the purchasers—that is, at less than their market value (see SAVINGS-BANKS).

Many complicated sets of tables have been prepared to facilitate the calculation of annuities. The latest known to us are the *Commutation Tables for Joint Annuities and Survivorship Assurances, based on the Carlisle Mortality at 3, 3½, 4, 5, and 6 per cent.* by David Chisholm, 2 vols., royal 8vo, 1858. The calculations are brought out in decimals. Taking the simplest of these tables—namely, those containing the value of an A. of £1, payable at the end of the first year, and thereafter annually during life—we find the following results, commuting the decimals into fractional money through Mr. Chisholm's decimal tables:

VALUE OF ANNUITY OF £1.									
Age.	£	s.	d.	Age.	£	s.	d.		
5	16	11	9½	45	12	12	11½		
10	16	13	4½	50	11	14	2½		
15	16	4	6½	55	10	7	11½		
20	15	16	4½	60	8	18	9½		
25	15	6	1	65	7	17	3½		
30	14	14	5	70	6	6	8½		
35	14	2	6½	75	4	19	9½		
40	13	7	9½	80	4	2	10½		

In political economy, annuities come within the class of payments which tend rather to consumption than to accumulation or reproduction. As the means of attaining a legitimate object, the establishment of an A. may be an advantage to the community in benefiting some individual member of it. For instance, a man is naturally extravagant—he would spend his heritage immediately, and come to want, if it were paid to him in capital. It is therefore vested in an A.; the man is kept in comfort, and society is not burdened with a needy member. Women are apt to mismanage by false investments or otherwise any capital sums left at their disposal, and therefore it is often advantageous to give them an equivalent in an A. In serving, however, these its legitimate objects, it will be seen that the money so spent is not in its character reproductive. People do save capital out of annuities; but, as a general rule, the object and effect of annuities are in the direction of consumption as contrasted with accumulation. This is often overlooked in settlements, especially by men who have themselves been accumulators. The consumptive effect of an A. will depend much on its coming out of fixed or fluctuating property. Take, as an instance of the former, a landed estate. If the clear rent be paid on annuities, the estate will not be improved, and it will be stagnant in the proportion so paid. If, out of a thousand a year, nine hundred be thus paid, the owner, out of his remainder of a hundred, is not likely to accumulate sufficient capital to improve the estate and double its value. But fluctuating property may not only be rendered stagnant, but may be destroyed by the burden of injudicious annuities. This is frequently exemplified in disposing of the profits of a business. Different members of a family are portioned off upon it, as if it were a fixed permanent estate; and consequently, there is not a sufficient balance left to induce any one to give his time and energies to the management of the business.

**ANNUITY**, in the law of England, is the right to the yearly payment of a certain sum of money, which is charged upon the person or personal estate of the individual bound to pay it. If it is charged upon real estate, the burden is called a rent, or rent-charge, and not an A. An A. may be created for a term of years, or for the life or lives of any persons named, or in perpetuity; and in the last case the A. is reckoned among incorporeal hereditaments; because, although the security is personal only, yet the A. may descend in the same manner as real estate. In 1854, the old statutes relating to annuities were repealed by 17 and 18 Vict. c. 90, and enrollment in chancery of annuity deeds is no longer necessary to give them validity. But by another statute of 18 and 19 Vict. c. 15, s. 12, any A. or rent-charge granted after 1855, otherwise than by marriage settlement for one or more life or lives, or for any term of years or greater estate, determinable on one or more life or lives, shall not affect any lands, tenements, or hereditaments as to purchasers, mortgagees, or creditors, unless and until a memorandum or minute of the name, place of abode, title, trade, or profession of the person whose estate is intended to be affected thereby, and the date of the deed, bond, instrument, or assurance whereby the A. or rent-charge is granted, and the annual sum or sums to be paid, shall be left with the senior master of the common pleas at Westminster, who enters the particulars in a book of alphabetical names. A fee of 2s. 6d. is paid to the officer; and any person may search the register for a fee of 1s. And when the A. is satisfied, and ceases to affect the lands, a memorandum is in like manner entered in this register (23 and 24 Vict. c. 115, s. 2). But this act does not require the registry of annuities or rent-charges given by will.

Many persons who have a small capital, and are desirous of obtaining the largest life income, may buy an A. from an insurance office, and government grants these in connection with the post-office.

An important feature of the law relating to annuities is, that they are considered as accruing from day to day, so that, whatever be the term or terms of payment, whether yearly, half yearly, quarterly, or monthly, whenever the annuitant dies, the payment of the A. is counted up to the day of the death, and the same remedy exists for recovering payment of the intervening days between the terms, as if the termly payment had then arrived.

A large number of annuities are created and kept alive by statutes relating to the public stocks, which are nothing else but annuities, not payable out of real estate, but granted to the holder and his heirs, and transferable by a short and easy method. The stocks in the funds are merely rights to receive certain annuities by dividends as they become due, subject to the right of the government to redeem such annuities on payment of a stipulated sum.

In Scotch law, an A., as such, may be charged on real estate as well as on personalty. In that system, it has been simply defined to be a right to a yearly payment in money; and it may be created either by the payment of the sum of money in the form of a purchase, or it may be secured over land, in which case the creditor, in the event of default of his A., may attach the land charged, claiming in his action for recovery a capital sum out of the land, sufficient to produce an annual interest equal to the A., which annual interest is paid until the expiration of the A., when the capital sum is restored to the debtor. The instrument by which, in Scotland, the A. is constituted in either of the above forms, is called a bond of A.; and before the repeal of the usury laws (by a recent statute, 17 and 18 Vict. c. 90), this form of deed was

frequently resorted to as a means of securing loans where a high rate of interest was charged; and the same practice prevailed in England. But the last-mentioned act renders all such expedients now unnecessary.

**ANNUITY-TAX**, a local impost for the payment of the salaries of the established clergy of the city of Edinburgh. It was first established on a limited scale by an act of the year 1661; and was extended in its sphere of operation by an act of the legislature as lately as 1809. It amounted at one time to 6 per cent on the rents of houses and shops within the royalty. It was a peculiarity of this tax that the members of "the College of Justice," including the lawyer class generally, enjoyed an exemption from it, as a relic of an ancient privilege by which they were induced to reside and hold the courts of law in Edinburgh. The tax was reduced in 1860; and, under an act passed in 1870, it was redeemed by payment of £56,500 by the corporation to the Edinburgh ecclesiastical commissioners.

**ANNULET** (Lat. *annulus*, correctly *anulus*, a ring), a term in architecture for a small fillet or band which frequently surrounds a column, etc. The A. is several times repeated in the molding which surmounts the shaft of a doric pillar, and is placed immediately under the ovolo of the capital.—A., a ring, a charge in heraldry of frequent occurrence.

**ANNUNCIADA**. 1. The religious order of the heavenly annunciation, or of the nuns of the annunciation of Mary, was instituted by Victoria Fornare at Genoa in 1682, after the rule of St. Augustine. All the convents of the order in France, Germany, and the Netherlands have disappeared since the French revolution. Some still exist in Italy. 2. Another order of the annunciation, or of nuns of Mary's announcement or the ten virtues, was endowed by John of Valois at Bourges in 1501, after its separation from Louis XII. In 1514, it was placed under the authority of the Franciscans. This order, which extended to fifty convents for the reception of poor gentlewomen, was broken up at the revolution. 3. The order of knights of the annunciation in Savoy, *ordine suprema dell' annunciazione*, known originally as the order of the neck-chain or collar, was instituted in 1360 by Amadeus VI., duke of Savoy. It received statutes from Amadeus VIII. in 1409; was renewed in 1518 under the name of the holy annunciation; and in 1720 was raised by Victor Amadeus to be the first order of the kingdom of Savoy. The king is always grand master. The knights, who, since 1720, are not limited in number, must be of high rank, and already admitted to the orders of St. Mauritius and St. Lazarus. They compose only one class. The decoration is a gold medal, on which is represented the annunciation, surrounded by love-knots. It is usually worn suspended by a simple gold chain; but the proper collar or chain of the order is composed alternately of love-knots and roses. On the roses are engraved the letters F. E. R. T., which some interpret *Fortitudo ejus Rhodum tenuit*, in allusion to the defense of Rhodes by Amadeus I., and which others hold to signify *Frappes, entres, rompes tous*. Since 1680, the knights wear on the left breast a star embroidered in gold. The four supreme officers of the order—the chancellor (always a bishop or archbishop), the secretary (usually the minister of foreign affairs), the almoner (usually the king's first almoner), and the treasurer—wear the decoration round the neck, suspended by a sky-blue ribbon, accompanied by a star on the left breast. For details of costumes, etc., see Burke's *Book of Orders of Knighthood*, p. 250, *et seq.*

**ANNUNCIATION, THE**. The announcement by the angel to the Virgin Mary of the incarnation of Christ (Luke i. 26–38). The festival of the A. is kept on the 25th of Mar., which was for a long period the beginning of the legal year in England. The earliest allusion to this feast is in a canon of the council of Toledo, 656 A.D. Chrysostom calls it "the root of all festivals." With a view to natural fitness, the framers of the church calendar placed the festival of Christ's nativity nine months after the A.

**AN'NUS DELIBERAN'DI**, in Scotch law, was meant to signify the period of a year allowed to an heir to deliberate whether he would accept the inheritance with the burden of his predecessor's debts. The year commenced on the death of the ancestor, unless in the case of a posthumous heir, when the year ran from the birth of the heir himself. But by a recent act of parliament—the 21 and 22 Vict. c. 76, sec. 27—it is provided that all proceedings "against an apparent heir on account of his ancestor's debt or obligation, for the purpose of attaching the ancestor's heritable estate, and actions of adjudication against such heir on account of his own debt or obligation, for the purpose of attaching such estate, may be insisted on at any time after the lapse of six months from the date of his becoming apparent heir" (23 and 24 Vict. c. 143, s. 16; 31 and 32 Vict. c. 101, s. 61).

**AN'OB'NIUM**. See BORER and DEATH-WATCH.

**AN'ODE** [Gr. *ana*, upwards, and (*h*)*odos*, a way], a term introduced into the science of electro-chemical decomposition (electrolysis) by Dr. Faraday to designate the positive pole, or that surface by which the galvanic current enters the body, undergoing decomposition (electrolyte). The negative pole, or that surface by which the current leaves the electrolyte, is called in the same nomenclature the *cathode* [*kata*, downwards, and (*h*)*odos*]. *Electrode* is the general term applied to either of these. The elements of electrolytes are called *ions* (*ōn*, going). Such as go to the A. receive the name of *anions*,

and those passing to the cathode, *cations*. Thus, in the decomposition of water by the passage into it of a galvanic current through two platinum plates, the water is the electrolyte; the platinum plate connected with the copper end of the battery is the A.; and the one connected with the zinc end, the cathode. The oxygen and hydrogen which are disengaged are the *ion*; the oxygen separating at the A. is the anion; and the hydrogen at the cathode, the cation. Anions and cations are more generally known under the name of electro-negative and electro-positive substances; but as these terms are considered by Dr. Faraday to imply certain supposed attractions for the positive or negative pole, the other terms have been employed by him to describe simply the part the substances play in electrical decomposition.

**AN'ODYNE** (Gr. *α*, privative, and *odynē*, pain), a medicine given to assuage pain. Properly, the term is applied to medicines, such as opium, which act on the nervous system, so as to decrease sensibility and induce sleep.

**AN'OINTING.** See CHRISM, CORONATION, EXTREME UNCTION.

**ANO'KA**, a co. in e. Minnesota on the Mississippi river, 420 sq.m.; pop. '80, 7005. Agricultural products and lumber are the staples. Co. seat, Anoka.

**ANOLIS**, a genus of saurian reptiles or lizards, native of tropical America, having teeth on the palate of the mouth as well as on the maxillary bones. They are remarkable for the power of inflating the skin of the throat, and for rapid changes of color of the inflated skin. They are entirely inoffensive, living on insects; are easily alarmed, and very rapid in their movements. There are several species, most of them bright green in color, varied with black.

**ANOMALIST'IC YEAR** is the interval that elapses between two successive passages of the earth through its perihelion, or point of nearest approach to the sun. If the earth's orbit had a fixed position in space, this period would correspond with that of a sidereal revolution, or the time the earth takes after leaving any point of the heavens to return to it again; but the disturbing influence of the other planets causes the perihelion to advance slowly (11".8 annually) in the direction of the earth's motion; so that the A. Y. is longer (4 minutes 39 seconds) than the sidereal. This will be better understood from the accompanying diagram, in which A'B'B' represents the elliptical orbit of the earth; S, the sun; A, the perihelion; and AB, the longer axis. When the earth, after leaving A, comes back to it again, after having completed a sidereal revolution, it finds the longer axis AB, and with it the whole ellipse, advanced to A'B', and it has still to describe an arc of 11".8 before it reaches its second perihelion A'. The length of the A. Y. is 365 days, 6 hours, 13 minutes, 49 seconds. It receives its name from the anomaly (q.v.).

Elliptical Orbit.

**ANOM'ALY** (Gr. *anomalía*, irregularity), the angle measured at the sun between a planet in any point of its orbit and the last perihelion. In the figure in the preceding article, if P be a planet, A'B'B' its orbit, S the sun, and A, the perihelion, the angle ASP is the A. It is so called because it was in it that the first irregularities of planetary motion were discovered. The A. was formerly measured from the aphelion, the opposite point of the ellipse; but from the fact that the aphelia of most of the comets lie beyond the range of observation, the perihelion is now taken as the point of departure for all planetary bodies.

**ANOMA.** See CUSTARD-APPLE.

**ANONA'CEÆ**, a natural order of dicotyledonous or exogenous plants, of which the type is the genus *anona*. They are trees or shrubs, with alternate, simple, generally entire leaves, destitute of stipules; flowers usually green or brown, axillary, solitary, or two or three together; the calyx of 3 to 4 persistent sepals; the corolla of 6 hypogynous leathery petals, in two rows. The stamens are generally numerous; the filaments short; the anthers adherent, turned outwards, and with a large 4-cornered *connective*. See STAMEN. The carpels are usually numerous, separate or cohering; the styles short; the stigmas simple; the ovules inverted. The fruit consists of distinct or united carpels, sometimes succulent; the seeds attached to the suture; their external covering brittle; the embryo minute, in the base of the hard albumen.—There are about 300 known species, mostly natives of tropical countries. They are generally aromatic and fragrant in all their parts, and some species are employed medicinally; the dry fruit of *xylopia aromatica* is commonly used as pepper by the African negroes, and was formerly imported into Europe as ETHIOPIAN PEPPER or GUINEA PEPPER. The flowers of some species are of exquisite fragrance; others yield delicious fruits. See CUSTARD-APPLE and CHERIMOYER.

**ANONYMOUS** (Gr., nameless), a term applied to a book the author of which does not give his name; when an assumed name is given, the term PSEUDONYMOUS is used. Works

of this class constitute one of the greatest difficulties of bibliography. French literature possesses an excellent *Dictionnaire des Ouvrages Anonymes et Pseudonymes* (2d ed., 4 vols.; Par., 1822-25) by Barbier, embracing the titles of about 24,000 works, with the names of those who are known or assumed to be the authors. Mr. Halkett, keeper of the advocates' library, Edinburgh, commenced a similar work for English literature, which, on his death in 1871, was continued by Mr. Laing, of the new college library, Edinburgh.

In Great Britain, political articles are always A., as is also most of the periodical criticism; but on the other side of the channel, this practice is far from common. It is generally admitted that anonymity secures the independence of the critic, and enables him to write with greater freedom, vigor, and power; but it is true that he often abuses his advantage, and gratifies, under the veil of the A., the worst passions of his nature. Perhaps the most intolerable abuse of anonymity is the anonymous letter. The miseries, anxieties, and terrors which this cowardly method of assailing people has occasioned, must excite against it the indignation and abhorrence of all honorable-minded men.

**ANOPLOTHERIUM** (from the Greek *a*, privative; (*h*)*oplon*, armor; and *therion*, a beast), a genus of extinct pachydermatous quadrupeds (see **PACHYDERMATA**), established by Cuvier from bones occurring in great abundance in the gypsum strata of the upper eocene (q. v.) formation, near Paris. They are found also in the same formation in the Isle of Wight and elsewhere. The teeth differ from those of all other pachydermata, extinct or recent. There are six incisors, two canines, eight premolars, and six molars in each jaw—the dental formula thus agreeing with that of the fossil genus *palæotherium* (q. v.); but the teeth are arranged in a continuous series without intervening vacancies—a circumstance very remarkable, as it does not occur in any existing quadruped, but now appears in man alone. The molars of the upper jaw are quadrangular, those of the lower marked with a double or triple crescent of enamel, which forms prominent ridges. In some respects the teeth resemble those of the *ruminantia* (q. v.), or ruminating quadrupeds, between which and the pachydermata the A. has been thought to form a connecting link; but in some of the species originally included in this genus, and which are now sometimes ranked along with it under the name *anoplotheroids*, the teeth exhibit peculiarities which have led to the supposition that their food may not have been exclusively vegetable. The snout is not much elongated, and it is evident that there was no proboscis. The feet are terminated by two toes, as in the *ruminantia*; but they have always separate metacarpal and metatarsal bones, not a single *canon* bone. A considerable number of species of A. and of *anoplotheroids* have been determined, differing in size from that of a small ass to that of a hare, or even of a guinea-pig; so that the smallest species must have been smaller than any hoofed quadruped now existing, or any known to have ever existed. They differ also considerably in general appearance, some having had comparatively long limbs and a light and graceful form, whilst some were firmly built and heavy. Their habits may be supposed to have differed accordingly. The true *anoplotheria* were probably very similar in habits to tapirs. The powerful flattened tails of some are supposed to indicate an adaptation for aquatic life; others have smaller supplemental toes, besides the two hoofs. They form the genera *dichodon*, *dichobune*, *xiphodon*, and *microtherium*.

**ANOPLURA**, the name given by Leach to an order of insects called *parasita* (q. v.) by Latreille, Cuvier, etc.—part of the *aptera* of Linnaeus—of which the type is the genus *pediculus* or louse (q. v.).

**ANOPSHEER**, a t. on the Ganges, in the Meerut division of the n.w. provinces, 65 m. from Delhi. Pop. '72, 9366.

**ANOUKIS**, or **ANAKA**, the "clasper" or "embracer," an Egyptian goddess, personifying the lower world or hemisphere. She is represented with a red crown; while Sati, who personifies the upper world, has a white crown. A. seems to have been analogous to the Greek Hestia, or Vesta. No statues of A. have been discovered.

**ANQUETIL**, LOUIS PIERRE, 1723-1808; a French historian; director of the academy of Rheims, and author of a history of that city. In 1759, he was prior of the abbey de la Roe, in Anjou, and soon afterwards director of the college of Senlis; later still, prior of Chateau-Renaud, near Montargis, which he exchanged for the curacy of La Villette, near Paris. In the reign of terror he was imprisoned in St. Lazare. He was an early member of the national institute, and employed in the department of foreign affairs. He left many historical works, for the most part crude and faulty in style.

**ANQUETIL-DUPERRON**, ABRAHAM HYACINTHE, an oriental scholar, was b. at Paris, Dec. 7, 1731. He commenced the study of theology in his native city, and afterwards prosecuted it at Auxerre and Amersfort. But his love of oriental languages drew him back to Paris, where he was assisted by the Abbé Sallier, overseer of the manuscripts in the royal library. As he now possessed a tolerable knowledge of Hebrew, Arabic, and Persian, he enlisted as a private soldier for India in 1754, to gratify his passion for learning; but Malesherbes and the Abbé Barthélemy rescued him from this degradation, and enabled him, through the royal munificence, to proceed independently. After his arrival in India, he traversed a great part of the peninsula, but finally fixed his residence at Surat, where there was a colony of Parsees, or fire-worshippers, with whose priests he

soon became so intimate, that they not only instructed him in the doctrines of Zoroaster, but also gave him some of their sage's books, written in Zend, in Pehlvi, and in Sanscrit. In 1762, he returned to Europe, having collected one hundred manuscripts, along with other curiosities. The Abbé Barthélemy now obtained for him a situation in the bibliothèque royale, and in 1763 he was elected a member of the académie des belles-lettres. In 1771, he published his *Zend-avesta*, in 3 vols., which contained the results of his researches. It consists of a literal translation of the *Vendidad*, as well as other sacred books of the Parsees, preceded by a narrative of his travels. This work created a great sensation when it first appeared. Until then, our only knowledge of the doctrines of the ancient Persians had been obtained from Greek and Roman sources, hostile Mohammedans, and eastern nations of a later origin. But A. now presented to the investigation of Europeans the original records of these doctrines, or, at least, records of incontestable authority. Unfortunately, his zeal far surpassed his patience and sagacity. He had not a sufficient mastery over the languages from which he translated. His translations are, consequently, anything but accurate. Since A. wrote, great advances have been made in oriental scholarship, and his labors are now in a great measure superseded. Among his other works we may mention his *Legislation Orientale*, 1778; *Recherches Historiques et Géographiques sur l'Inde*, 1786; *La Dignité du Commerce et de l'état du Commerçant*, 1789; *L'Inde en Rapport avec l'Europe*, 1790; *Oupnek'hat* (a selection from the theological portion of the Vedas), 1804. He d. at Paris, 17th Jan., 1805.

ANSALONI, GIORDANO, a Sicilian Dominican missionary, who died under torture, Nov. 1, 1634, in Nagasaki, Japan, whither he had gone from the Philippine islands, after learning the Japanese language in a hospital at Manila. He labored two years as a priest before he was discovered. Another priest and 69 converts suffered death with him.

ANSARIES, or ANSARIANS, called also Nossairians, an Arab sect living in the mountains between the n. part of Lebanon and Antioch; found also in Antioch and other towns and villages of the coast. Little is known of their origin or history. They endeavor to conceal their doctrines from strangers, and of their own people none but male adults are admitted to the secrets. But it is evident that their tenets are a mixture of paganism and Mohammedanism, with some faint suggestions from Christianity. Their founder, Nossair, who lived about 890, taught that God appeared eleven times in human form, to Abraham, Moses, Jesus, Mohammed, and others; that he always encountered opposition, whereupon he returned to heaven, wrapped himself in a blue mantle, and resorted to the sun, which is therefore an object of their worship. They are said, by some writers, to look for a messiah who will be the twelfth person of human form in whom God will appear. Other accounts are that they hold to seven manifestations of the supreme deity, of which Ali is the only one to be adored. They believe in migration of souls, which for the faithful will be a progress from pure to more pure until they become stars; but sinners will be transformed into Jews, Christians, donkeys, dogs, and hogs. They practice circumcision and ablution, and pray in the open air three times a day. Promiscuous intercourse of the sexes is practiced on certain festivals, and their religious rites are believed to be vile. Though their religion inculcates benevolence, honesty, and patience, they are thievish and superstitious, yet hospitable. Each community is governed by a mokaddem, who is almost entirely independent. It is said that the most numerous of the three sects into which the A. are divided worship a beautiful young woman, who is elected goddess once in three years. A late writer estimates their number at over 200,000, and says that they believe in a divine unity in three persons, the last two being created. The first, the supreme deity, is Manna or "meaning," the second Ism or "name," the third Bab or "dove." There is also a system of hierarchies wonderful for number; there are 14,000 "near ones," 15,000 "cherubim," 16,000 "spirituals," 17,000 "saints," 18,000 "hermits," 19,000 "listeners," and 20,000 "followers," besides prophets, apostles, and heroes. They profess to receive, among other sacred books, the Old and New Testaments, and the Koran.

ANSCHÜTZ, KARL, 1813-70; royal musical director in Coblenz, and director in Nuremberg, Amsterdam, London, and New York, founding in the latter city the German opera, in 1862.

ANSELL, RICHARD, b. 1815; an English painter chiefly of animals and field sports. He painted "The Battle of the Standard," and worked in association with Creswick, the landscape artist.

ANSE, a name sometimes given to the handles of a cannon. These handles, especially in some foreign cannon, are cast in the forms of dolphins or serpents.

ANSE DE PANIER, a French term for arches which are the result of elliptical curves in section; an elegant form for bridge arches.

ANSELM of Canterbury, a scholastic philosopher, was b. at Aosta, in Piedmont, in 1033. He led at first a dissipated life; and, like Abelard, wandered through France, after the fashion of the scholars of those days, disputing wherever he could find an adversary. Attracted by the reputation of Lanfranc, he went, in 1060, to study at the monastery of Bec, in Normandy. Three years after, he became prior, and in 1078, abbot of this monastery, the most famous school of the 11th century. Lanfranc, who in the

meantime had gone to England, and became archbishop of Canterbury, d. in 1089; and the diocese remained four years without a successor, till, in 1093, A. was appointed. He was distinguished both as a churchman and a philosopher. His numerous embroilments with William Rufus and Henry I., and the unbending spirit which he displayed in these, even when subjected to banishment, indicate the vigor and resoluteness of his character, as much as his writings exhibit the depth and acuteness of his intellect. In 1720, Clement XI. expressly placed him in the list of church authorities. A. was a second Augustine, superior to all his contemporaries in sagacity and dialectical skill, and equal to the most eminent in virtue and piety. Embracing, without question, the doctrines of the church, mostly as stated by Augustine, and holding that belief must precede knowledge, and must be implicit and undoubting, he yet felt the necessity of a religious philosophy, urged the duty of proceeding from belief to knowledge, and sought to reduce the truths of religion into the form of a connected series of reasonings. It was for this purpose he wrote his *Monologium sive Exemplum Meditandi de Ratione Fidei*. In his *Prologium*, otherwise entitled *Fides quærens Intellectum* (faith seeking intellect), he strove to demonstrate the existence of God from the conception of a perfect being. This ontological proof, however, has never been held satisfactory. His writings, *Cur Deus Homo*, and *De Concordiâ Præscientiæ et Prædestinationis*, made an epoch in Christian philosophy. A. may justly be reckoned the earliest of the schoolmen, although Alexander of Hales (q.v.) was the first who completely systematized in the scholastic manner the doctrines of the Catholic church. He d. 21st April 1109, and was buried at Canterbury. The day of his death is observed in the Roman Catholic church. See Rémusat's *Anselme* (1853) and Church's *A.* (1870).

**ANSER.** See ANAS and GOOSE.

**ANS'GAR**, or ANSCHARIUS, styled the apostle of the north, on account of his labors to introduce Christianity into Denmark, Sweden, and northern Germany, was b. in Picardy about the year 801 A.D. Under the patronage of Louis le Débonnaire, he went, with his colleague Audibert, to preach the doctrines of Christianity among the heathen Northmen of Schleswig, where he suffered many persecutions; but had nevertheless such success that, in 832, the pope established an archbishopric in Hamburg, and A. was appointed the first archbishop. Here he passed through many difficulties, having to save his life by flight in 845, when the Northmen and Danes under Eric I. plundered Hamburg. He afterwards made several missionary tours in Denmark and Sweden, and d. Feb. 3, 864, at Bremen, where a church was named after him. The Roman Catholic church has canonized him.

**ANSON**, a co. in s. North Carolina, on the Rocky and Yadkin rivers, 650 sq. m.; pop. '70, 12,428—6951 colored. It has an undulating surface and productive soil; agriculture is the chief industry. Co. seat, Wadesborough.

**AN'SON**, GEORGE, LORD, Admiral, b. on 23d April, 1607, at Shugborough, in Staffordshire. From an early period he manifested a predilection for a sea-life. In 1716 he served as second lieutenant under Norris; next under Byng in 1718, against the Spaniards; and was made a captain in 1723. In 1739, when war with Spain broke out, he was recalled from the Carolina station, on which he had been placed since 1724, and received the command of the fleet in the South sea, with instructions to inflict whatever injury he could on the Spanish commerce and colonies, and sailed from England in Sept., 1740. The preparations for this cruise had been made in the most slovenly manner. Both vessels and stores were bad, and the sailors were old Chelsea pensioners; yet A., in spite of these disadvantages, achieved a brilliant reputation by the heroism, prudence, diligence, and humanity he displayed. After his little fleet of seven vessels had been scattered by a storm, in doubling cape Horn, he landed at Juan Fernandez, where he was soon joined by three of his ships, which arrived in a dismantled condition. While he remained on this island, he exhibited his native tenderness of character by the assiduity with which he cared for the sick. Under these disadvantages, he made several prizes, including a Spanish galleon from Acapulco, with a cargo worth £400,000. After this he returned to England; and arrived at Spithead, June 15, 1744, having circumnavigated the globe in three years and nine months. His perilous cruise greatly extended the knowledge of navigation and geography. As a reward for his services, A. was made rear-admiral of the blue (1744); and in 1747, having defeated the French admiral Janquière, at cape Finisterre, he was made baron of Soberton; and four years later, first lord of the admiralty. In 1761, he was made admiral of the fleet. He d. June 6, 1762. Few works have been so popular as lord A.'s *Voyage Round the World*. It was written by Mr. B. Robins, from materials supplied by lord A., who carefully supervised it.

**ANSONIA**, a village in the t. of Derby, Conn., on the Naugatuck river, 10 m. w.n.w. from New Haven; pop. '80, 3855. It is a place of manufactures, especially of clocks and brass work.

**AN'SPACH**, or, more properly, ANSBACH, a t. of Bavaria, the capital of the circle of Middle Franconia (*Mittel-Franken*), on the Rezat, 25 m. s.w. from Nürnberg. It has manufactures of cotton and half-silken fabrics, tobacco, earthenware, playing-cards, cutlery, and white lead; also a considerable trade in wool, flax, and corn. The situ-

ation is pleasant, but there are no remarkable buildings, except the deserted palace of the former margraves of A., surrounded by gardens, and the church of St. Gunibert, said to occupy the site of a church erected in the 8th c., around which the t. grew. The margraves of A. were a branch of the family of Hohenzollern. The last of them sold his possessions in 1791 to Prussia; and in 1806, Napoleon I. transferred A. to Bavaria. Pop. '75, 13,299.

ANSPACH, ELIZABETH BERKELEY, Margravine of, 1750-1828; daughter of Augustus, earl of Berkeley, and wife of the earl of Craven, who d. in 1791, after which she married the margrave of Anspach. She was highly accomplished, and of singular versatility, writing and performing dramas, and composing many biographical memoirs.

ANSTED, DAVID THOMAS, an English physician, b. 1814; educated at Cambridge, and professor of geology at King's college, London, and at the college of civil engineers at Putney. For many years he was engaged on works illustrating the application of geology to engineering and mining. He has a high reputation as a consulting engineer. Besides geological works he has published *Scenery, Science, and Art, The Channel Islands, Correlation of the Natural History Sciences, The Ionian Islands, and Physical Geography*.

ANSTER, JOHN, LL.D., 1798-1867; an Irish poet; educated at Trinity college, Dublin. In 1819, he published *Poems and Translations from the German*, which gained him the friendship of Coleridge, by whose advice A. completed a version of Goethe's *Faust*. He was called to the Irish bar in 1824, and was regius professor of civil law in Dublin university. Afterwards he published a second volume of *Poems and Translations*, and *Introductory Lecture on the Study of the Civil Law*.

ANSTEY, CHRISTOPHER, 1724-1805, an English poet; educated at Eton and designed for the church, but failing to get his degree, he returned to private life. He entered the army, and sat in parliament. Among A.'s works are the *New Bath Guide*, the *Election Ball*, and some others now forgotten.

ANSTREUTHER (EASTER and WESTER), two contiguous royal burghs of Fifeshire, 9 m. s. of St. Andrews, with which, along with Crail, Cupar, Killybeggy, and Pittenweem, they join in returning a member to parliament. Fishing, fish-curing, and tanning are the chief occupations. East A. is the birthplace of Dr. Chalmers, Tennant the poet, and Goodsir the anatomist. Pop. of both burghs, '71, 1653.

ANT, *Formica*, a Linnæan genus of hymenopterous insects, now divided into several genera, which form a family called *formicidae*. The English name is contracted from *emmet*, still also occasionally used. Another old English name, not now in frequent use, is *pismire*. The species are numerous, and are generally distributed over temperate and tropical regions. Their habits and instincts are extremely interesting, and have attracted attention from remote ages.

Ants are small insects, but of extraordinary muscular strength. They carry loads of ten or twelve times their own weight, and display great activity. They have a triangular head; the antennæ are geniculate; the jaws strong; the ligula or lower lip small, rounded, vaulted or spoon-like; the thorax compressed at the sides; the abdomen nearly oval, the pedicel which joins it to the thorax forming in some kinds a single and in some a double scale or knot. They live in societies, often very large, which consist, as in bees, of *males*, *females*, and *neuters*. The neuters are females with imperfect ovaries, transformed at an early stage of their existence, and are distinguished into two classes, *workers* and *soldiers*, the former constituting the greater portion of each society, the latter somewhat differing from them in larger size and larger and more powerful head. The ordinary work of the society is performed by the workers: the principal part in warfare, defensive or offensive, is taken by the soldiers. The males and females constitute but a small portion of each community. They have delicate glistening wings; but the neuters have no wings, and the thorax is smaller and more compressed. The males are smaller than the females, and the workers are rather smaller than the males. The females and neuters of some kinds (genera *ponera*, *myrmica*, *atta*, and *cryptocerus*) are armed with stings; other kinds (*formica* and *polyergus*) have no sting, but have the power of ejecting a peculiar volatile acid, FORMIC ACID (q.v.), from a small sac in the abdomen; by this means effectually repelling many adversaries, to which the pungent fumes are intolerable. Small animals are soon killed by the vapor of an ant-hill; and a dog has been known to retire yelling from the effect upon his eyes, either of the vapor, or of a discharge of the fluid itself. It is said that when those ants that are unprovided with a sting make use of their mandibles to inflict a bite, they curve round their abdomen, so as to be ready immediately to squirt this acid into the wound.

The winged ants mostly appear in autumn, and perish before the commencement of the cold weather; a few surviving to found new colonies and perpetuate the race. The neuters pass the winter in large numbers in a torpid state, and resume their activity on the return of spring. The nests of ants, after midsummer, are usually found to contain winged males and females mixed with the wingless neuters, which, however, restrain them, and particularly the females, from making their escape into the air, until the pairing season, when they ascend into it in immense swarms, those from many ant-hills sometimes uniting their myriads, rising with incredible velocity in distinct

columns, and soaring to a great height. "Each column looks like a kind of slender net-work, and has a tremulous undulating motion. The noise emitted by myriads and myriads of these creatures does not exceed the hum of a single wasp. The slightest zephyr disperses them." They occasionally, however, make their appearance in such prodigious numbers that the air is obscured by them.—The pairing of ants is supposed to take place in the air. Some of the females which escape destruction by their enemies, or by the elements, found new colonies, in which at first they perform the work usually assigned to neuters. Some, however, are seized by the neuters of ant-hills near which they fall, and there is even reason to think that these go out to search for them; they are stripped of their wings, and forcibly conducted to the habitation, the number of whose inhabitants is to be increased by their multitudinous progeny. They are fed and treated with apparent respect, like the queen-bee among bees; but a society of ants, unlike one of bees, often contains numerous females, each thus treated and equally employed in the important work of laying eggs. Unlike the queen-bees, also, they are invariably denuded of their wings; nor is this always done by the neuters, to prevent their escape, but the female ant, after fecundation, has been seen to denude herself of her own wings, as now superfluous appendages.

The eggs of ants are so small as to be scarcely visible to the naked eye. The mother drops them at random in her progress through the nest; but the workers, of whom some are always in attendance on her, immediately seize them, moisten them with their tongue, and lay them in heaps in particular apartments of the nest. They continue to watch them, and to remove them from one quarter of the nest to another, apparently in order that they may always enjoy a suitable temperature, and perhaps in order to avoid any excess of moisture. In a few days the young larvæ are produced; and these require the unremitting care of the workers, which feed them, disgorging into their mouths, for this purpose, a viscid substance, supposed to be the ordinary food of the species, prepared for their use by a sort of half digestion. They are also extremely careful to keep the young brood clean, by constant application of their tongue and mandibles; and a great amount of labor is daily expended upon them in conveying them from the inner apartments of the nest towards the surface after sunrise, when the weather is fine, and back again before sunset, or when the weather becomes cold, or there is a prospect of rain. The same care is extended to the pupæ. The larvæ and pupæ are the white objects which the workers are seen hastily seizing and carrying off to places of safety, when an ant's nest is broken open; and the resemblance of which, particularly of the pupæ, to grains of barley, is supposed to have contributed to the general belief, that ants amass stores of corn for winter food. The larvæ have no organs of locomotion. The pupæ are enveloped in delicate silken cocoons, and unlike those of other insects, require assistance to extricate themselves from them when they have attained their perfect state. This assistance also is afforded by the workers.

The whole supplies of food for the inmates of the nest are brought to it by the workers. The food of some kinds is exclusively or chiefly animal; that of others, vegetable. The provisions carried to their nests by the ants of Britain and other countries in which the winter is cold are apparently not intended for winter, when the creatures are entirely torpid, but only for present use; and few, if any of the species, feed on grain or seeds. But colonel Sykes discovered at Poonah a species of ants (*atta providens*), which not only store up provisions, but of which the stores consist of the seeds of a species of millet; and Mr. Moggridge has recently determined by careful observation that large stores of grain and seeds are laid up by some of the ants of the south of Europe, especially *atta barbara* and *atta structor*. The grain and other seeds stored up by ants seem, in some way not yet known, to be deprived of the power of germination. The ant has long been a sort of proverbial type, not only of industry, but of provident care for the future. Some ants, however, collect and carry to their nests substances which are not intended for food, but for the construction of the nest, and particularly for closing its apertures in cold or wet weather. In this way they gather together small heaps of chips of wood, bits of straw, small pebbles, etc.

The vegetable substance which ants seem chiefly to use as food is sugar; and to this, wherever it is to be found, they seem to be guided by a very acute sense of smell. *Honey-dew*, the saccharine excretion of the *aphides* (see APHIS), is a favorite food of many species; and with this are connected some of their most extraordinary instincts; for not only do they climb the plants on which the aphides abound, that they may obtain this food, but they have been seen to wait beside them for new drops, and even to touch them with their antennæ, in order to cause the drops to flow, patting the abdomen of the aphid on each side alternately and rapidly; the ant, after the drop has been obtained, passing on to another aphid. The whole process has been likened to the milking of cattle. Even more wonderful things are asserted on this subject, as that particular ants seem to regard particular aphides as their own property, and are ready to fight in defense of their right to them—that, to secure them for themselves, they convey them from one place to another—and that the *aphis radicum*, which derives its nutriment from the roots of grass and other plants, is actually kept in large numbers in the nest of the yellow ant (*Formica flava*), in order that there may be always at hand a copious supply of food, these aphides and their eggs sharing the solicitude of the ants equally with their own eggs and young. Things so wonderful are ascertained beyond dispute in regard to the instincts of

ants, that even such statements as these must not be hastily rejected as incredible, and certainly they express the beliefs of careful and scientific observers.

Ants which feed upon animal food render important service in clearing away every vestige of the flesh of dead animals, and so preventing corruption; and very beautiful skeletons of small animals have been obtained by burying the animal for a short time in an ant-hill. But ants also attack living animals: insects of comparatively large size fall a prey to them, and in tropical countries, birds, reptiles, and small quadrupeds are sometimes devoured by their vast swarms, which strip the bones of the animal perfectly clean with wonderful rapidity. Domestic animals, at least when sick, are not safe from them, and man himself regards them with dread. About 100 years ago, vast numbers of a particular kind of ant (*F. saccharivora*) appeared in the island of Grenada. This species makes its nest under the roots of plants, and the sugar-canes were so weakened and injured in consequence, that the plantations became nearly unproductive. "They descended from the hills like torrents, and the plantations, as well as every path and road for miles, were filled with them. Rats, mice, and reptiles of every kind became an easy prey to them; and even the birds, which they attacked whenever they lighted on the ground in search of food, were so harassed, as to be at length unable to resist them. Streams of water opposed only a temporary obstacle to their progress; the foremost rushing blindly on certain death, and fresh armies instantly following, till a bank was formed of the carcasses of those which were drowned, sufficient to dam up the waters, and allow the main body to pass over in safety below. Even fire was tried without effect. When it was lighted to arrest their route, they rushed into the blaze in such myriads as to extinguish it." A reward of £20,000 was offered in vain for an effectual means of destroying them; but in 1780 a hurricane which tore up the canes, and exposed their habitations to a deluge of rain, freed the island from this plague.

The habitations of ants are very curiously constructed, displaying great ingenuity, although with great diversity in the different species. The greater number of species form their habitations in the ground. These rise above the surface in the form of a dome; hence the name *ant-hills* commonly given them. The largest ant-hills formed by any British species are those of the large red or horse ants (*formica rufa*), which are sometimes as big as a small haycock; but travelers in South America describe ant-hills of 15 or 20 ft. in height. The nest of *F. rufa* is outwardly of rude appearance—a confused heap of such portable materials as were within reach; but within, it contains numerous small apartments, of different sizes, arranged in separate stories, some deep in the earth, some above its surface, and communicating with each other by means of galleries. Use is made of the earth excavated from below to mix with other materials in the construction of the upper parts of the fabric. Many species of ants, sometimes called mason ants, construct habitations by a still more elaborate masonry, making use, for this purpose, of soft clay, which they spread and mold by means of their mandibles and feet, appearing all the while to examine their work by their antennæ. The partition-walls of the galleries and apartments of the *formica brunnea* are about half a line thick, and about  $\frac{1}{4}$  in. high; the roofs are somewhat arched, and pillars are frequent in this marvelous architecture. M. Huber saw a working-ant of another species (*F. fusca*), without assistance, make and cover in a gallery which was 2 or 3 in. long, and of which the interior was rendered perfectly concave. There are other species, sometimes called carpenter ants, which make their habitations in the trunks of old trees, gnawing the wood into apartments and galleries, with floors and partitions as thin as card. *Formica flava* forms its partition-walls of a sort of *papier-mâché* of saw-dust, earth, and spider's web. *F. smaragdina*, an East Indian species, forms its nest of a thin silk-like tissue. *F. bispinosa*, in Cayenne, makes a felt of the down which envelops the seeds of the *bombax criba*. An East Indian species, *myrmica kirbyi*, forms a globular nest of a congeries of tile-like *laminæ* of cow-dung, the interior exhibiting an assemblage of apartments and galleries. Some Australian ants form their nests of the leaves of trees glued together, after being first brought into the proper position by the united strength of multitudes.

Of the ants which form their nests in the ground, some, instead of constructing ant-hills, seek the protection of stones, roots of trees, etc. This is the case with some of the British species, and also with the sugar-ant of the West Indies, already mentioned.

Many interesting anecdotes are on record illustrative of the instincts of ants, and of the sagacity which they seem to possess. They appear also to have some power of communicating with each other, in which it has been supposed that the antennæ are chiefly employed. Some such power might be supposed to be necessary, if we could venture to reason from analogy upon such a subject, not only to their architectural and other ordinary operations, in which many must take part, systematically and conjointly, but also in their predatory and warlike excursions; for these also some of the species have. If, during the predatory excursions of the *atta cephalotes* (a South American species), an intervening space occurs which they cannot cross, some of the creatures link themselves together—as monkeys, in like circumstances, have been known to do—forming a bridge over which the main body passes. Ants are, in general, both courageous and pugnacious. Many battles take place among them, both between individuals and large parties; and after a battle, combatants may be found locked in each other's

arms, as having died together in the struggle. More extraordinary than anything of this kind, however, is the fact, sufficiently ascertained, that some species of ants go on regular forays to carry off the larvæ and pupæ of certain other species, which they carry to their own habitations to rear and employ them as slaves in the work which might be regarded as properly belonging to workers of their own race—a fact to which no other at all analogous has yet presented itself in natural history. The species known thus to make and keep slaves are *polyergus rufescens* and *formica sanguinea*, both sometimes called amazon ants. It has been noted as a curious circumstance, that the kidnappers are red or pale-colored ants, and the slaves jet black. The kidnapping excursions take place only at a particular period of the year, when the nests of the black ants contain the neuter brood. The army of red ants (*P. rufescens*) marches forth, the vanguard, which consists of 8 or 10 only, continually changing; and on their arriving at the nest of the negro ants, a desperate conflict ensues, which ends in the defeat of the negroes; and thereupon the red ants, with their powerful mandibles, tear open the now undefended ant-hill, enter it, and emerge, carrying the pupæ in their mouths, with which they return in perfect order to their own nest. The pupæ are there treated with great care, and spend their lives among the red ants, excavating passages, collecting food, carrying larvæ, etc., as if this had been their original destination. The amazon ants are not natives of Britain, although plentiful in some parts of Europe.

Formic acid has been employed as a stimulant in gout and paralysis, and is sometimes exhibited in continental practice by means of *ant-baths*, which are prepared by boiling crushed ants, or whole ant-hills, and immersing the diseased limb in the steam.

TERMITES (q. v.), or WHITE ANTS, are very different from the true ants, and belong to the order *neuroptera*.

**ANTACIDS** are medicines which correct abnormal acidity of the stomach and intestinal canal by directly combining with the free acid that may be present. Their action is obviously merely temporary, as, unless combined with other medicines, they do not correct the morbid condition which causes the undue acidity; and their too prolonged use must be carefully avoided, since, at all events, some of these medicines, as the alkalies and their carbonates, are liable to induce a state of general anæmia, morbid deposits in the urine, and a series of symptoms not unlike those of scurvy. Antacids are best given in association with vegetable tonics; and for the reasons already stated, their administration must be carefully watched, and should be occasionally omitted. Dr. Neligan makes the following excellent remarks on the particular remedy to be employed for special forms of acidity: "When the acid exists in the stomach in the gaseous state, ammonia or its carbonates should be preferred, as, in consequence of their volatility, a gaseous acid which would elude the action of the fixed alkalies, may be neutralized by them. If the acidity be present in the lower bowel, as in the cæcum or colon, magnesia or lime ought to be administered, as being less likely than the other antacids to be neutralized or absorbed before it reaches that portion of the intestinal canal. When the acid exists in the urinary organs, the alkalies will be found best adapted, as they have a tendency to act more directly on the kidneys; and when it is *lithic* (or *uric*) acid which preponderates in the urine, the preparations of lithia or potash should be preferred to those of soda, as the salts formed by the two former with the acid in question are much more soluble than those formed with the latter. In persons of a corpulent habit of body, potash is to be preferred to ammonia or soda when the use of an alkali is indicated. And, finally, ammonia and its preparations are best adapted for the old and debilitated, as also for those of enfeebled constitution." The antacids include solutions of ammonia, lime (commonly known as lime-water), potash, and soda, various carbonates of these substances, magnesia and its carbonates, and the carbonate and citrate of lithia.

Many of the medicines of this class possess other properties besides that of neutralizing free acids; but a notice of such properties does not fall within the scope of the present article.

**ANTÆ.** See PILASTER.

**ANTÆUS**, in fable, a giant in Lybia, son of Poseidon (Neptune) and Terra (the earth). He compelled all strangers passing through the country to wrestle with him, but when he was thrown he received fresh strength from contact with his mother earth, and proved invincible. With the skulls of those whom he had slain, he built a temple to his father. Hercules discovered the secret of his renewal of strength, lifted him from the earth, and strangled him. This struggle is a favorite subject in ancient sculpture.

**ANTAGONIST MUSCLES.** Every muscle is opposed in its action by another muscle, or elastic ligament; e.g., in the arm the triceps extensor is opposed by the biceps flexor and brachialis anticus; the diaphragm, whose action aids in expanding the chest, is opposed by the external abdominal muscles. The diastole of the heart in vertebrates is best explained by elasticity, as it exerts very little power. The predominance of power in antagonist groups of muscles determine the position of different parts of the body when at rest, the naturally bent positions of the fingers during sleep showing the prevailing power of the flexors. The natural balance of muscles is sometimes disturbed by disease.

**ANTALCIDAS**, a Spartan politician, who made himself conspicuous in a very perilous crisis of the history of his nation by the skillful character of his policy. Some time after the Peloponnesian war, it seemed as if Athens were destined to regain the supremacy she had lost. The Greek states rallied round her; while Conon, an able and vigilant Athenian admiral, and his ally, Pharnabazus, the Persian, were everywhere victorious in their naval encounters with the Spartan fleet. It became necessary, therefore, that communications should be entered into with the Persian king, from whom the confederate Greeks drew their chief resources. A. was chosen ambassador to Tiribazus, satrap of Western Asia. On hearing this, the Athenians grew alarmed, and sent Conon to frustrate the schemes of the former; but Tiribazus took A.'s part, and the result was, that Conon was thrown into prison, and A. secretly received money to enable Sparta to continue the war. At first, Artaxerxes, the Persian monarch, was dissatisfied with the conduct of his satrap, recalled him, and put Struthas, a friend of Athens, in his place; but through a complication of circumstances, which it is unnecessary to mention, A. was subsequently completely successful in securing the goodwill of Artaxerxes. He was now appointed admiral of the Spartan fleet, and assisted by Tiribazus, Ariobarzanes, etc., swept the seas until Athens became desirous of peace. For various reasons, so was Argos and Sparta herself. Tiribazus therefore assembled deputies from the Greek states, and, in the name of his master Artaxerxes, read the famous declaration or treaty of peace, to which all the members present agreed, and which is known in history under the name of "the peace of Antalcidas," as being the result of the latter's able diplomacy. Its three great points were as follows: 1. That all the Greek towns on the mainland of Asia Minor, together with the islands Clazomene and Cyprus, should remain under the protection of the Persian king. 2. That all other Greek towns, large and small, should be independent; but that the islands of Lemnos, Imbros, and Scyros should belong to Athens. 3. That war should be declared against whatever state refused to accept these points. After this peace, the history of A. becomes doubtful and obscure. He seems to have lost favor with the Persians, and Plutarch even leads us to suppose that, sickened by misfortune and the loss of reputation, he voluntarily starved himself to death; but this story is not credited by scholars, both on account of its intrinsic improbability and its apparent disagreement with the statements of other writers.

**ANTANACLASIS**, in rhetoric a figure in which a word is repeated in a sense different from its first use, to give additional force to the expression: as the remark of Benjamin Franklin when he was about to sign the declaration of American independence: "we must all hang together, or we shall assuredly all hang separately."

**ANTANANARIVA**, or TANANARIVA, the capital city of Madagascar, and seat of the government, has a population estimated at 80,000. It is situated on a hill, in an undulating district, at an elevation of 7000 ft. above the level of the sea. It is exposed to fearful hail and thunder storms. The approach to it from Tamatave, the chief seaport, is extremely tedious and difficult, owing to the want of roads. It is, in spite of this, the seat of considerable trade and industry. The royal palace occupies the summit of the hill; adjoining are the dwellings of the chief officers of government; and below these, covering the slope of the hill, and built on terraces, are the houses of the other inhabitants, constructed almost entirely of wood. The people exhibit a considerable aptitude for civilized usages; and, thanks to missionary enterprise, considerable progress has been made towards the adoption of European habits.—See the works on Madagascar by Mullens (1875) and Grandidier (1876); also *Three Visits to Madagascar* (1858) and *Madagascar Revisited* (1867) by Ellis. In the latter work will be found a plan of the city, showing the missionary churches, chapels, dispensary, hospital, etc., and views of the principal houses.

**ANTAR**, or ANTARA, a celebrated Arab chief of the 6th c., one of the seven poets of Arabia, whose prize poems, embroidered in golden characters on a silken ground, were hung up on the gate of the Caaba, and thence called *moallakat*—i.e., the suspended. In the poem of his that has descended to our day, he paints his warlike deeds, and his love for Abla. His courage and heroism during a 40 years' warfare between two Arab tribes, and his constancy in love, were long dear to the memory of his countrymen, and appear to have formed the groundwork of the voluminous romance called *Antar*, commonly ascribed to Asmai, and reduced to writing as early as the days of the calif Haroun Alrashid, in the 8th century. This work, which has come down to us in a later and much corrupted form, gives an attractive and faithful picture of Bedouin life, and is rich in epic interest, although too monotonous to satisfy the taste of the European reader. In the east, however, it still supplies the favorite themes of the professional story-tellers who haunt the coffee-houses. A poetical translation of it into English was made by Terrie Hamilton in 1830.

**ANTARCTIC CURRENT**, a drift, traceable first along the shores of Victoria land in the southern region of perpetual frost, which carries ice and cold water along the western coast of South America. It is much like the gulf stream, only the latter warms the cold n.w. of Europe, while the former cools the tropic heats of western South America.

**ANTARCTIC LANDS**, the unexplored space beyond 70° s. lat., comprising an area of about 4,700,000 sq. miles. The latest information and speculations about this region.

laid before the British association, favor the supposition that there is no continuous Antarctic continent, but a congeries of low continental lands and islands connected by bridges of ice which form part of the solid ice cap covering the whole to the height of about 1400 ft. The region is intersected by continental chains, like the range between 55° and 95°, which includes Peter the great island, Alexandra land, Graham land, Adelaide island, and Louis Philippe land; also by at least one volcanic range, discovered by Ross in 1841, which stretches from Balleny islands to lat. 78° s., and reaches a height of 15,000 ft. The A. lands are surrounded by a fringe of ice, which extends in a perpendicular cliff of an average height of 230 ft., outside of which ice extends seaward in winter 20 ft. thick or more, and in summer this floe gives place to pack ice and drifting bergs. It is reasoned that the uniform height of the ice does not exceed 4400 ft., because any addition increases the pressure and lowers the mass which is melted away at the bottom by the internal heat of the earth. See POLAR EXPEDITIONS, *ante*.

**ANTARCTIC OCEAN**, the sea round the south pole, as the *Arctic ocean* is the sea round the north pole. It is otherwise called the Southern ocean, comprising all the sea to the south of the Atlantic, the Indian, and the Pacific oceans. In this view, the A. O.'s northern limit may be conveniently divided into three straight lines—the *first* between cape Horn in South America and cape Agulhas in Africa; the *second*, between cape Agulhas and the southern extremity of the Auckland islands as an appendage of New Zealand; and the *third*, between the southern extremity of the Auckland islands and cape Horn. This appears to form the true boundary of the polar regions of the southern hemisphere. The most northerly isles which it incloses are New Georgia, at the mouth of the Atlantic, and Kerguelen's land, at the mouth of the Indian ocean. The latter tells its own story in its other title of "The Land of Desolation;" and the former presented to Cook, even in the middle of summer, perpendicular cliffs of ice, and valleys covered with everlasting snow.

It is usual, indeed, to define the A. O. and the corresponding ocean to the north, as being contained each within its own polar circle. But with regard to both oceans alike, this definition appears to be inadmissible. It is only at two points—the head of the Pacific and the head of the Atlantic—that the Arctic sea can possibly reach the Arctic circle at all; while, in point of fact, it overlaps it at Behring's strait by nearly a degree, and falls several degrees short of it between the northern half of Norway and the s.e. shore of Greenland. The A. O., again, is nowhere practically limited by the definition in question: not a single voyager hesitates to use the expression long before he arrives at lat. 66° 30' s.; nor yet is a single authority consistent in the use of the arbitrary nomenclature.

The A. O. has been explored, more or less satisfactorily, by various navigators, as far as 79° s. With a few exceptions, however, little of it is accurately known, the difficulties and dangers of its navigation rendering thorough and continuous investigation almost impracticable. The names that will recur in their proper places are New Georgia, Kerguelen's land, Sandwich land, New South Shetlands, New Orkneys, Enderby's land, Graham's Land, Balleny, Sabrina, and Victoria land.

Taken as a whole, these lands bear a very small proportion to the extent of an ocean which embraces half the latitudes and all the longitudes of the southern hemisphere, exceeding its kindred sea to the north, as a glance at the map will show, by nearly half of Asia and North America, and the whole of Europe. Such of these lands as are really accessible at all times, have been more or less valuable in connection with the whale and sea fisheries.

The features of the A. O. itself may be briefly stated to be constant fogs, baffling currents, innumerable icebergs, and magnificent manifestations of the aurora australis. On the coast of Victoria land, beyond the parallel of 70°, two mountains have been observed to be of a height altogether unequalled in such a latitude—mt. Terror, of 10,000 ft., and mt. Erebus, of 12,400. The latter is a volcano, being, it is apprehended, the only phenomenon of the kind in either of the frigid zones.

Of the two circumpolar oceans, the southerly one has excited much less interest than the northerly. The open passages round the two capes respectively into the Indian ocean and the Pacific, have, from the very beginning, rendered unnecessary any such voyages as those which, for nearly three centuries, have developed so much patience and fortitude in the heroic explorers of the Arctic shores.

**ANTA'RES**, a red star, thought by the ancients to resemble Mars. It is a double star, and the most conspicuous object in the constellation Scorpio. A. is often of use to navigators in finding longitude.

**ANT-BEAR.** See **ANT-EATER**.

**ANT-CATCHER** and **ANT-THRUSH**, names given to birds of tropical and sub-tropical countries, which feed chiefly upon ants. They are closely allied to the thrushes (see **THRUSH**), and are included with them in the family *turdidae* or *merulidae* of recent ornithologists. They are distinguished by a straight sub-cylindrical strong bill, hooked at the tip, slender legs, and very short tails. They form the genus *myiothra* of Illiger, now subdivided into several genera, one of which, *pitta*, contains the *brèves* of Buffon—birds of brilliant plumage, natives of the south-eastern parts of Asia and the Malayan archipelago. The true ant-catchers are mostly American, are of comparatively sober plu-

mage, live among the huge ant-hills, seldom fly, and are remarkable for their sonorous voices, the power of which in some species is extraordinary. The largest species, known as the *king of the ant-catchers* (*grallaria rex*), is about the size of a quail. Its legs are remarkably long.

**ANT-EATER**, *Myrmecophaga*, a genus of South American quadrupeds belonging to the natural order *edentata*. The species are few. They are perfectly toothless, their food being insects, and particularly ants, which they procure in great numbers by thrusting among them a very long cylindrical tongue, covered with a viscid saliva, and then retracting it into the mouth. The head is remarkably elongated, with a slender muzzle, and a small mouth. The tongue is doubled up in the mouth when not in use for catching prey. The ears and eyes are very small. The toes differ in number in the different species, but are united as far as the base of the claws, which are very large and strong, adapted to tearing up the habitations of ants. The great A.-E. (*M. jubata*), a native of the warm parts of South America, and called in Demerara the A.-bear, is about 4½ ft. in length from the snout to the origin of the tail, which is more than 2 ft. long, and is covered with very long hair. The body is also covered with long hair, particularly along the neck and back. There are 4 claws on each of the fore-feet, and 5 on the hind ones. The A.-E. spends much of its time in sleep, the long snout concealed in the fur of the breast, the hind and fore claws locked together, and the bushy tail thrown over all, as if for a shade from the sun. It is very unsocial in its habits, and is regarded as a very stupid animal. It has great strength in its fore-legs and claws, and is said to hug like the bear, so as to crush an enemy to death. The female produces one young one at a birth, and carries it about for some time on her back.—Another species, the tamandua (*M. tamandua*), having the same number of claws, has a less elongated snout, comparatively short hair, and a prehensile tail, is scarcely so large as a cat, and climbs trees in quest of its insect food.—The little or two-toed A.-E. (*M. didactyla*) differs from these species not only in the number of its toes, but in other anatomical characters.—Closely allied to this genus in structure and habits is the genus *manis*, containing the PANGOLINS of Africa and India; but instead of hair, the body is covered with strong horny scales. See PANGOLIN.—The name A.-E. is given at the cape of Good Hope to the *orycteropus capensis*, the aard-vark or earth-hog of the Dutch colonists, a quadruped of about the same size with the great A.-E. of America, belonging to the same natural order, and resembling it also in its elongated muzzle and extensile tongue, which it employs in the same way, but provided with grinding teeth and flat claws adapted for burrowing. It burrows with extraordinary facility, and it is in this way that it seeks to secure its safety when assailed. It has very short hair, and little of it. The ears are moderately long. It is a nocturnal animal, and very timid.—The *echidna* of New Holland are sometimes called porcupine ant-eaters, from their food and their similarity to the true ant-eaters in their sharp muzzle and extensile tongue; but they differ much in some parts of their structure. See ECHIDNA.

**ANTECEDENT**, a term in logic, grammar, and mathematics. Thus we call a proposition in logic from which another is deduced, or a general principle which serves as the base and support of some particular proposition, the A. In grammar, the A. is the word which precedes the relative—as, for example, "The *man* who dies for his country should be held in honor." Here "man" is the A. In mathematics, we speak of the A. of a ratio—i.e., the first of two terms which compose the ratio. Thus, in the ratio of 4 to 3, 4 is the A. The word is also used in the plural in a peculiar sense. "We know very little of his *antecedents*"—i.e., of his previous character or conduct.

**ANTEDILUVIAN** is the word used to denote whatever existed before the flood. The A. ages are those which elapsed before the flood, and, in theological language, the A. religion means the religion of the patriarchs from Adam to Noah. In geology, the "A. period" has no reference to the deluge recorded in the Mosaic narrative, but only to the final transformation of the earth by means of water.

**ANTELOPE**, a co. in n.e. Nebraska; 864 sq.m.; pop. '76, 1303. Co. seat, Oakdale.

**ANTELOPE**, *Antelope*, a genus of mammalia belonging to the order of ruminants (q.v.), and to the hollow-horned section of that order—in which the horns consist of an elastic sheath surrounding a bony process of the skull, and are permanent, not annually renewed. The antelopes have the bony nucleus of the horns solid, not occupied, as in those of goats, sheep, and oxen, to a considerable extent, with cells communicating with the frontal sinuses. They are also distinguished from the allied genus of goats by having the chin beardless, and from them and sheep by the horns not being longitudinally angled or ridged. The horns of antelopes are, however, very generally annulated, or surrounded with thickened rings. The body is slender and deer-like, the feet small and elegant, the tail short and tufted, the hair generally short, and the color often lively. Some species, however, have comparatively long hair; and a few which inhabit cold mountainous regions are clothed with wool intermixed with longer and coarser hair, particularly the chamois (q.v.) of the Alps, Caucasus, etc.; the Rocky mountain goat (q.v.) of North America; and the chiru (q.v.) of the Himalayas. Many species have infra-orbital sinuses or *tear-pits* like deer (q.v.). The females of many species, as of deer, are destitute

of horns; and if they alone came under observation, it would be difficult to say to which genus they belonged. The size is very various; the guevei or pigmy A. of Africa (*A. pygmaea*) is only 8 to 9 in. high at the shoulders, whilst the largest species measure 5 or 6 feet. Almost all the species of antelopes are peaceable, timid animals, and are distinguished by their agility and fleetness. Most of them are gregarious. Some inhabit plains; others are found only in the most inaccessible mountainous regions; whilst others dwell in jungles and deep forests. North America possesses two or three species, which depart considerably, as does also the chamois of Europe, from the typical character of the genus. Europe produces only the chamois and the saiga (*A. saiga*), the *colus* of Strabo, which inhabits the southern plains of Poland and Russia. Asia has a greater number of species; but they are most numerous in Africa, and particularly in south Africa. The known species amount to more than eighty, which are arranged in sections or groups according to the peculiarities of the horns and other characters, but a satisfactory classification of them is difficult. Some naturalists make a family of *antelopeae*, and subdivide it into genera, but they are not separated by sufficiently marked characters. The flesh of all antelopes is used as food; hence they are much objects of the chase. They furnish also great part of the subsistence of beasts of prey in Africa, where some of the species exist in such numbers that, particularly when severe drought occurs in the regions which they ordinarily inhabit, dense and multitudinous herds occasionally appear in the interior of Cape Colony, to the terrible devastation of the crops. Even the saigas of the Tatarian plains congregate in herds of many thousands in the end of autumn.

The name A. is sometimes more particularly restricted to a species also known as the common or Indian A., and as the *sasin*. It is a native of India and the eastern parts of Asia, and is a beautiful animal, about 2½ ft. high at the shoulder, with erect, diverging horns, bent in a spiral of two or three turns. The hair is uniformly short, except that, as in many other species of A., there are small tufts of bristles on the knees. It inhabits open plains, and the herds exercise great watchfulness. Its fleetness is such that greyhounds chase it in vain; and it can easily bound over an inclosure of 11 ft. in height, or over a distance of 10 or 12 yards. The flesh is held in small esteem, and the animal is less than many of its congeners an object of the chase.—The saiga is a much less graceful animal; its horns are short, and, as in many of this genus, curved first outwards and then inwards, so that the whole outline formed by them resembles that of a lyre. They are used by the Russians and Chinese for the manufacture of many articles of domestic economy; and it is chiefly for their sake and that of the skin that the saiga is hunted, the flesh having a disagreeable taste, which is ascribed to the saline and aromatic plants of the steppes. The *dzeren* (*A. gutturosa*), sometimes called the Chinese A., and known among the Chinese by a name which signifies the yellow goat, is an inhabitant of the arid deserts of central Asia, the flesh of which is highly esteemed, and which is therefore a chief object of the chase in these regions. It derives its specific name from a large movable goitre-like protuberance on the throat of the old males, produced by a dilatation of the larynx.—The *addax*, or Nubian A. (*A. addax*), which was known to the ancients, and is mentioned by Pliny, has horns very similar to those of the Indian A., but is a larger animal, less graceful, with a slight mane on the neck, a tuft of long hair on the forehead, and large broad hoofs, adapted for treading on fine and loose sands. It inhabits the deserts of central Africa, and, contrary to the usual habits of the genus, is said not to be gregarious, but to live in pairs. The *chikara* and some other Indian species are distinguished by two additional rudimentary horns in front of the ordinary horns, and immediately over the orbits. The *chikara* inhabits thick forests and jungles. Like the *addax*, it lives in pairs; as do also the *stein-boc* (q.v.) of south Africa, an extremely graceful species; and the *kleene-boc* of the same country (*A. perpusilla*), a beautiful and active little creature, with very small horns. The *kleene-boc* is of a mild and gentle disposition, and extremely capable of domestication. The *gazelle* (q.v.) of north Africa (*A. dorcas*), one of the species known to the ancients, is very frequently domesticated; and from its gracefulness of form, its gentleness of manners, and its bright black eyes, has afforded to the Arabian poets one of their most favorite objects of comparison. The south African spring-boc (q.v.) is another very beautiful species, and is frequently domesticated by the colonists at the cape of Good Hope. Among the numerous species which that country produces may be mentioned also the *blauw-boc* (*A. leucophaea*); the *riet-boc* (*A. arundinaceus*); and the *Caffrarian oryx* (q.v.), (*A. oryx*), which somewhat resembles, but is quite distinct from, the oryx of the ancients (*A. leucoryx* or *A. gazella*), also called the *algazel*, a native of the countries on both sides of the Red sea. Still more worthy of notice among the south African species, but in some measure departing from the strict A. type, is the *eland* (q.v.), the largest of all the antelopes—an animal which may yet probably be found very valuable in domestication. The *kudu* (q.v.) is another noble species, allied to the eland. The *nyl-ghau* (q.v.) of India, and the *gnu* (q.v.) of south Africa, are also among the largest antelopes, but depart still further from the generic type, particularly the latter, so that a separate genus (*catoblepas*) has been constituted for it, having better claims to be recognized than the other genera into which it has been proposed that the antelopes should be divided. Less different from the ordinary type, but still with a marked approach to a bovine appearance, are the *bubalus* (q.v.) of the ancients, a native of the north of Africa, the Arabic name of which signifies wild ox, and the *kaama* (q.v.) or *harte-beest* of the

cape of Good Hope, which is nearly allied to it. The prong-horn (q. v.) and the Rocky mountain goat (q. v.) are the best known North American species; and both are found only in the western parts of the continent. It has been proposed to introduce the latter, as a wool-bearing animal, into the highlands of Scotland.

**ANTENNÆ**, in zoology, jointed filaments with which the heads of insects, crustacea, and myriapoda are furnished, and which are evidently very delicate organs of touch. They are therefore sometimes called feelers. The name A. is derived from *ante*, before. The A. are placed on the anterior or superior part of the head; the animals appear to feel their way with them, and to them is ascribed the bee's power of working in the dark. Some suppose that they are also organs of hearing, and by means of them it would appear that many insects, as bees and ants, have the power of communicating with one another. They possess great flexibility, but differ very much in the number of joints which they contain (amounting sometimes even to 100), in the relative length and thickness of their joints, and also in their form, being filiform or thread-like, clavate or club-shaped, feathered, etc., in endless variety.

**ANTE'NOR**, the wise Trojan who advised his fellow-citizens to send Helen back to her husband. His friendliness to the Greeks became complete treason when the city was taken and his house was spared by the victors. Legends differ about him; one is that he built a city on the site of Troy; others make him the founder of various cities in Italy.

**ANTEQUE'RA** (the *Anticaria* of the Romans), an important t. in the province of Malaga, Spain, is situated in a fertile plain, 45 m. w. of Granada. Pop. 30,000. The inhabitants are engaged chiefly in agricultural operations, but also manufacture baize, silk, cotton, and paper. They are noted for their love of bright colors in dress. Although A. is clean and well built, it is rarely visited by travelers, on account of its lying considerably off the high road. As late as 1544, the place possessed, in almost perfect condition, an ancient palace and theater; but about that time the stones were plundered to build a convent, and only a few were spared, which are now imbedded in the walls of the town. A., like all the other cities of south Spain, was for a while in the hands of the Moors; but in 1410 it was retaken by the regent Fernando, who is hence called *El Infante de A.* When the French took the place, during the Peninsular war, they converted a curious old mosque—a relic of Moorish sway—into a storehouse, and on their departure carried off with them the magnificent Moorish armory.

**ANTHE'LIA** (Gr. *anti*, opposite, and *helios*, the sun; Ger. *Gegensonnen*) are luminous rings, seen by an observer on a cloud or fog which lies opposite to the sun. They occur chiefly in alpine regions and in the polar seas, and are only seen when sunshine and cloud, or fog, occur at the same time. They appear in the following way: When, from an elevated position—as the mast of a ship, or the ridge of a hill—the shadow of an observer is projected by the sun on a cloud or fog, he sees the head encircled by a glory or luminous ring, diminishing in brightness as it leaves the head as a center. When the sun shines brightly, and the fog is dense, as many as four concentric rings of this nature are seen by the observer round the shadow of his head, having their common center in the point where a line from the sun through the eye of the observer meets the fog. When the phenomenon assumes this form, the rings are more or less colored—the colors of the two inner rings being generally brilliant, those of the third more faint, while those of the fourth are scarcely perceptible. This last has an angular radius of about 40°, and is very seldom seen. It bears frequently the name of the circle of Ulloa or the white rainbow. A phenomenon substantially similar to the A. occurs when, the sun being near the horizon, the observer sees an aureola surrounding the shadow of his head cast upon grass or corn moistened with dew. The occurrence of A. is generally attributed to the diffraction (q. v.) of light.

**ANTHELMINTICS**, medicines for destroying or expelling intestinal parasites; those which destroy are vermicides; those which expel, vermifuges. Among articles for the purpose are senna, pink-root, santonin, oil of turpentine, oil of fern, and pumpkin and pomegranate seeds.

**ANTHEM** (Gr. *anti*, in return, *phone*, voice; a piece sung in alternate parts), a species of musical composition introduced into the service of the English church after the reformation, and appointed to be sung daily, at morning and evening service, after the third collect. The words of the A. are taken from the psalms, or other suitable parts of the scriptures, and the music is either for solo, soli, or chorus, or a mixture of all three. As a specimen of English music, it can only be heard to perfection in cathedral service. In its origin, musical construction, and use, it is similar to the motet of the Romish church, which name has been retained by the Lutheran church. See **MOTETT**; also **ANTIPHONY**.

**ANTHEMIS**. See **CHAMOMILE**.

**ANTHEMIUS**, a Greek architect and mathematician, son of Stephanus, a physician, and one of five brothers, eminent as physicians, lawyers, and grammarians. It is supposed that A. anticipated Buffon in using burning glasses, and some say he knew the force of steam. He was eminent as an architect, and produced in 532, under the patronage of Justinian, the plans for the great church of St. Sophia, in Constantinople—plans which display great knowledge and great ignorance.

**ANTHEMIUS**, or **ANTHEMIUS PROCOPIUS**, a Roman emperor who reigned from 467 to 472. He was son-in-law of the emperor Marcian, and had been a favorite general of Leo, emperor of the east. His son-in-law, Ricimer, became A.'s enemy, proclaimed Olybrius emperor, and took Rome, putting A. to death.

**ANTHER.** See **STAMEN**.

**ANTHERIDIUM**, the name given by some botanists to an organ in cryptogamous plants which they suppose to be analogous in its functions to the stamen or male organ of fructification in phanerogamous plants. Antheridia are variously situated on the surface of plants or within their tissue. Sometimes they are simple cells; sometimes they are composed of a number of cells, containing a mucilaginous fluid, and peculiar small bodies called *phytozoa* (q.v.), which at a certain period exhibit active movements like those of animalcules. The antheridia finally discharge their contents through an opening; and it is supposed by some that their contact with another class of organs, to which the name pistillidium (q.v.) has been given, is essential to the production of spores, the seeds of cryptogamous plants. But these names are to be regarded as at best only provisional, and these views as far from being sufficiently established.

**ANTHOL'OGY** (Gr. flower-collection) is the title usually given to a book consisting of an unconnected series of choice thoughts, whether in prose or verse, but generally in the latter. Of the collections of this kind made in ancient times, which consisted mostly of epigrammatic poems, the best known are the

*Greek Anthologies.*—The first Greek A. was compiled by Meleager of Gadara, in Syria, about 60 B.C. Besides this, there were three or four others belonging to periods considerably subsequent to the birth of Christ; but all these earlier anthologies are lost. What we now possess are two later collections, one by Constantine Cephalas in the 10th c., who borrowed largely from one of the earlier anthologies; and another by Maximus Planudes, a monk of Constantinople in the 14th c., who, by his tasteless selection from the A. of Cephalas, rather spoiled than increased the already existing store. The A. of Planudes was first issued in print at Florence in 1494 by a learned Greek, John Lascaris, and for a long time was the only one known. It went through successive editions, and received various improvements. The latest edition (with the Latin version of Grotius, a masterpiece of latinity and rapid execution) was commenced by Bosch in 1795, and finished by Lennep in 1822. Meanwhile, Claude Salmasius had discovered in the Heidelberg library (1606) the only extant manuscript of the older and richer A. of Constantine Cephalas, which he compared with that of Planudes, copying out the poems not found in the latter. During the Thirty Years' war, the Heidelberg manuscript was carried to Rome: but in 1797, after the peace of Tolentino, the French contrived to secure possession of it, and brought it to Paris. In 1816 it was returned to Heidelberg. After the important discovery of Salmasius, the work was often mentioned by the name of the Palatinate manuscript, or the Vaticano-Palatinate. Portions of it were published by Jensiuss, Leich, Reiske, and Klotz. The entire collection, augmented by fragments of the older poets, and by epigrams found on monuments and in other works, was edited by Brunck at Strasburg in 1776, under the title *Analecta Veterum Poëtarum Græcorum* (Selections from the Old Greek Poets), and later by Jacob, under the title of *Anthologia Græca, sive Poëtarum Græcorum Lusus ex Recensione Brunckii* (Greek A., or Fugitive Pieces of the Greek Poets, from the corrected Text of Brunck), 1794-1814, at Leipsic. Since then, it has been published variously, in whole or part. It is impossible not to admire these gems. Nowhere is there to be found a richer variety of poetic life, greater delicacy of sentiment, a more joyous serenity, a greater abundance of wise, true, humane thoughts, than sparkle in the pages of the Greek A. To the poet, it presents the most graceful images and the most exquisite conceptions; to the philosopher, maxims adorned with all the graces of style; to the historian, monumental inscriptions; to the philologist, the most varied forms of an imperishable language; to all, a charming revelation of antiquity.

*Latin Anthologies.*—In 1573, Scaliger published at Leyden, in imitation of the Greek A., a Latin A., under the title *Catalecta Veterum Poëtarum* (Gatherings from the Old poets), and Pitthöus one at Paris, 1590. A larger collection was issued at Amsterdam (1759 and 1773) by Peter Burmann the younger, under the title *Anthologia Veterum Latinorum Epigrammatum et Poëmatum* (A. of Old Latin Epigrams and Poems), a more correct and better arranged edition of which was published by Meyer in 1835.

Asiatic literature is extremely rich in anthologies, which consist sometimes of extracts from the best poets, arranged according to the subject, and sometimes of "beauties" of their best poets, with biographical notices, which are either placed in chronological order, or according to the countries in which the authors lived.

1. *Arabic Anthologies.*—Abu-Temam published selections from the old Arabic songs previous to the time of Mohammed, arranged them in ten books, and named the entire collection after the first book, which consisted of war-songs, *Hamāsa*. Another famous A. is the *Divan* of the Hudhallites (an Arabic tribe), an edition of which was published by Kosegarten. Abul-Faraj of Ispahan (died 966) gathered together in his *Kitāb al-aghāni* (Book of Songs), all the ancient Arabic songs down to the first centuries of the califate. It was published by Kosegarten in 1840. Abul-Faraj accompanied the work with a minute commentary, which makes it one of the most interesting of the old Arabic literature. But the richest and most complete A. of the later Arabic pöesy is *Yatimat*

*al-dahr* (the Pearl of the World), by Taalebi, in which the writers are arranged according to the provinces in which they lived. It has been continued and enlarged since the period of the original compiler. Besides these and similar national anthologies, collections have been made in almost every province where the Arabic culture and speech prevailed. Such, for example, are the numerous Arabico-Spanish ones, though these are but little known.

2. *Persian Anthologies*.—In the Persian literature, the best known works of this sort are *Taskarat al Shuara* (Lives of the Poets), by Daulat Shah (died 1495), the contents of which are to be found almost entire in Hammer's work on Persian *belles-lettres* (Vienna, 1818), and *Atesh Kedah* (the Fire Temple), by Haje-Lutf-Ali-Beg, who lived about 1770. Both works give biographical notices of the Persian poets; the first, in chronological order; the second, in topographical order, with specimens from their works. An A. of the best Persian poetry, arranged according to the subjects, is given in the *Medshua al Shuara* (a Collection of Poets).

3. *Tatar Anthologies*.—Of the poets who have written in the Tatar—i.e., the East Turkish or Tshagatai dialect—we possess a collection comprising 441 biographies, with specimens of their poetry: *Madshahis alnasais* (Charming Company), by Mir-Alischir (died 1500), and the *Lives of the Tatar Poets*, by Sadiki, extending down to the 17th century.

4. *Turkish Anthologies*.—The number of anthologies in the West Turkish, or, as it is generally called, the Turkish language, is very numerous. The most famous are—*Hesht Behesht* (the Eight Paradises), by Sehi of Adrianople (died 1548); *Taskarat al Shuara* (Lives of the Poets), by Latifi (died 1582), and, under the same title, a similar work of Ashik Tshelebi (died 1571); and the great collection, *Subdat al-ashaar* (the Blossoms of Poetry), by Kassade (died 1621). The substance of these an'hologies is to be found in Hammer's *History of West Turkish Poetry* (Pesth, 1836).

5. *Indian Anthologies*.—The literature of the Mohammedan population of Hindustan, which is a mere copy of Persian literature, has also several anthologies. The most important are—*Gulzar-i Ibrahim*, by Ali Ibrahim, containing biographical notices of 300 Hindustani poets, with specimens of their writings; the collection called *Divani Ihan*, by Beni-Narayan; *Guldastai Nishat* (Garland of Pleasure), by Manu Lal (Calcutta, 1836), and *Guldastai Nazm-ain*, by Kerim-ed-din (Calcutta, 1845). The substance of these works is to be found in Garcin de Tassy's *Histoire de la Littérature Hindui et Hindoustani* (Paris, 1839-1847), which, under the title of *Tabakditi Shuara-i Hindi*, was translated into Hindustani by Kerim-ed-din (Delhi, 1848). In the pure Hindi, we have a rich collection of songs, the *Ragd Sagar*, by Krishnananda (Calcutta, 1845).

6. *Sanscrit Anthologies*.—The Sanscrit literature is not so rich in anthologies as the other oriental literatures. If we do not consider the Vedic hymns, and the collections of poems which bear the general title *Sataka* (a Century), anthological in the proper sense, there is only one work of this kind known—viz., the *Paddhati*, by Sarngadhara, towards the close of the 14th c., in which are gathered together 6000 detached strophes of the most famous epic, lyric, and dramatic poets of India, arranged under certain heads.

7. *Chinese Anthologies*.—From the earliest ages, the Chinese had the custom of sending, along with the yearly tribute to the emperor, copies of such songs as had acquired popularity. Confucius selected from a great number of these 311 of the most beautiful. These are preserved under the name *Shi-king* (Book of Songs), one of the canonical books of the Chinese. This is the oldest A. in the world. A Latin version, by Lacharme, was published at Stuttgart, 1830; a German one, by Rückert, at Altona, 1833. Besides this, there is *Tchao-ming-wen-siouen*, a collection of the finest poems of the time of the Liang dynasty (502-556 A.D.), and also *Thang-shi*, poems of the time of the Thang dynasty (618-914 A.D.).

ANTHON, CHARLES, LL.D., a well-known editor of classics, was b. in the city of New York in 1797. At the age of 14, he entered Columbia college, where he pursued his studies with ardor and success for 4 years. Having been originally intended for the law, he now passed through a preliminary practical instruction in his brother's office, and in 1819 was admitted to the bar of the supreme court of the state of New York. His time, however, was chiefly devoted to classical literature, for which he soon began to acquire a high reputation; and in 1820, when only 23 years of age, he was appointed adjunct-professor of languages in Columbia college, which office he held for 15 years. He now commenced that series of classical publications which has done so much to make available for popular purposes the erudite researches of European scholars. His first work was a new edition of Lempriere's *Classical Dictionary*, which was almost immediately reissued in England. In 1830 appeared his larger edition of Horace, quite a novelty in its way, on account of the superabundant English notes which accompanied the text. In 1833, he issued a smaller edition, for the use of schools and colleges. Virgil, Cæsar, and other ancient writers have been illustrated in the same attractive manner. A's editions of the classics have acquired an extensive popularity; but scholars are disposed to regard them with a kind of learned aversion, both because of the temptations they present to the school-boy to overlook the difficulties of a knotty passage, and of the superfluous and often unimportant matter which is dignified with the title of "commentary" or "notes." It cannot be doubted, however, that these works have given a healthy stimulus to the rudimentary study of the ancient authors. In 1831, A. received

the degree of LL.D. from his Alma Mater. In 1835, he succeeded prof. Moore in the chair of languages. A. likewise published large works on ancient geography, Greek and Roman antiquities, mythology, literature, etc. He d. July 29, 1867.

ANTHONY, HENRY B., an American statesman, b. R. I., 1815; a graduate of Brown university, 1833; became editor of the *Providence Journal*, 1838, which position he held more than 20 years; in 1849 was elected governor of Rhode Island; re-elected in 1850, and declined further nomination for the office. He was elected U. S. senator in 1858; re-elected in 1864, '70, '76; was chosen president *pro tempore* of the senate in 1869, and again in 1871.

ANTHONY, SUSAN BROWNELL, b. Mass., 1820; one of the principal leaders of the "woman's rights" movement; daughter of a Quaker. She was a teacher in New York for 15 years, and was long distinguished for zeal and eloquence in the anti-slavery cause. She is still an eloquent advocate of total abstinence and woman-suffrage.

ANTHONY, SAINT. See ANTONY, ST.

ANTHOXANTHUM. See VERNAL GRASS.

ANTHRACENE, or PARANAPHTHALINE,  $C_{14}H_{10}$ , a solid hydrocarbon accompanying naphthalene in the last stages of the distillation of coal tar. It has acquired great importance as the material from which alizarine is manufactured. A ton of A. can be obtained by the distillation of about 2000 tons of coal, besides the A. contained in the pitch. Pure A. occurs in bluish white foliated crystals, having a violet fluorescence. A little above 200° C., it melts to a limpid liquid which rapidly becomes dark colored. It is not perceptibly volatile at 100°, but between 210° and 220° it sublimes easily, yielding a fetid and irritating vapor. It is soluble in boiling alcohol, and in light naphthas, from which it crystallizes out on cooling. Heated slightly with fuming sulphuric acid, it dissolves gradually, giving a greenish solution of sulphanthracene acid. A. has been made artificially from toluole and from benzole. See ALIZARINE.

ANTHRACITE (Gr. *anthrax*, a coal), a mineral substance of the nature of coal, but consisting of carbon with a minimum amount of hydrogen. It is of a black color, conchoidal fracture, and imperfectly metallic lustre (hence called *glance-coal*). It burns slowly, and without flame, and hence is sometimes called *blind-coal*. Its vegetable origin cannot be doubted. Where strata of common coal have been broken through by trap dikes, the coal next the trap is found to be A., with a gradual transition into the ordinary state; hence geologists look upon A. as natural coke (q.v.), formed by heat or other process from ordinary coal. A. is used as fuel like coke. It is applied in many places to the burning of lime and bricks, the reduction of iron, etc. It occurs extensively in Ireland, and in some of the coal-fields of England, Scotland, and the continent of Europe; but on the largest scale in the United States.

ANTHRACITE (*ante*), hard coal, mined in America chiefly from about 470 sq. m. in eastern Pennsylvania, where three parallel deposits occur in the counties of Dauphin, Schuylkill, Carbon, Northumberland, Columbia, and Luzerne. A. was found very early in the valley of Wyoming, and was used by smiths as early as 1768-69. In 1776, A. from near Wilkesbarre was floated down the Susquehanna to Carlisle, and was used in the government arsenal. A. was discovered at the Lehigh end of the Schuylkill coal-field by Philip Ginter, a hunter, in 1791, and a quarry was opened the same year. In 1803, 100 tons were brought from Summit hill to Philadelphia, and were sold to the city government for use in the pumping works, but the engineers did not know how to burn it, and it was broken up to gravel the walks in the yards. In 1814, two ark-loads were sold at the falls of the Schuylkill at \$21 per ton. A morning was wasted in futile attempts to burn this coal, and at noon the workmen and their employer, discouraged at their ill-luck, shut up the furnace and went to dinner. On their return they were astonished to find a roaring fire, the furnace doors red-hot, and the furnace itself in danger of melting. From that day dates the successful use of A. in America. The development of this interest is shown in the following table:

THE ANTHRACITE COAL PRODUCTION OF PENNSYLVANIA, IN TONS OF 2240 LBS.

YEARS.	WYOMING REGION. Luzerne and Sullivan cos.		LEHIGH REGION. Carbon, Columbia, and Luzerne cos.		SCHUYLKILL REGION. Schuylkill, Northumber- land, Columbia, Dauphin, and Lebanon cos.		ALL THE RE- GIONS.

A. is the purest form of natural carbon, except the diamond. The carbon varies from 95 per cent in specimens picked from the best veins, to 80 or 85 per cent. Coal containing less than 80 per cent of carbon is not classed as anthracite. The volatile matter present is water, oxygen, hydrogen, and nitrogen; the ash contains oxide of iron, iron pyrites, silica, alumina, lime, etc. Pennsylvania anthracites have usually 86 to 94 per cent of carbon,  $1\frac{1}{2}$  to 7 per cent of volatile matter, and  $1\frac{1}{2}$  to 7 per cent of ash; the density varies from 1.4 to 1.63. A. was derived from bituminous coal by heat acting under great pressure, and probably caused by pressure in the geological changes which threw the anthracite regions, as in eastern Pennsylvania, into great mountain waves. The heat drove off all volatile matters which it would develop from the bituminous coal, and left the more stable material behind as a natural coke, differing from artificial coke only in its superior density. The loss of vegetable matter by decomposition in the formation of bituminous coal is estimated at about three fifths of the material, and in the production of A. at about three fourths; the added compression leaves the resulting bulk about one fifth or one eighth the original mass. It follows, then, that to produce a vein of A. 30 ft. thick, 240 ft. of vegetable matter must have existed. The coal deposits, as found in the A. formation near Pottsville in the Schuylkill valley, include 15 groups, with 30 beds or veins more than 2 ft. thick, and 20 seams less than 2 ft. The thickest, or mammoth vein, is a single bed from 20 to 70 ft. thick, in some places divided into 3 layers by seams of slate. About four fifths of the present production of A. comes from this vein. The aggregate thickness of the coal veins at this point is 113 ft., of which 80 ft. may be profitably mined. See COAL. The possibilities of the production of A. in America may be gathered from the following table, issued Jan. 3, 1880, by the *Engineering and Mining Journal*, and compiled by Richard P. Rothwell:

THE AREA AND CONTENTS IN COAL OF THE ANTHRACITE BASINS OF PENNSYLVANIA.

FIELD.	AREA.		Feet of coal.	QUANTITY OF COAL.		Per cent.
	Square miles.	Acres.		Per A., tons.	Total quantity, tons.

**ANTHROPOLOGY** (Gr.), a term signifying, according to its derivation, the worship of man, and always employed in reproach. Thus, the early Christians accused the heathens of A., because, in their mythology, men were represented as exalted among the gods, although an *apotheosis* (q.v.) was in these cases alleged by their worshipers; and the heathens retorted the charge because of the worship of Christ; the reply to which was the assertion of his divinity. But the term is chiefly known in ecclesiastical history in connection with the employment of it by the Apollinarians (q.v.) against the orthodox Christians of the 4th and 5th c., with reference to the doctrine of the perfect human nature of Christ.

**ANTHROPOLOGY** (from the Gr. *anthropos*, man), a term signifying that branch of science which has man for its subject. In its proper sense, it is very comprehensive, and of course includes anatomy, physiology, psychology, ethnology, history, theology, æsthetics, etc. The word has, of late, come into very common use. There is an anthropological society in London; and a separate anthropological section has been constituted in the British association.

**ANTHROPOLOGY** (*ante*), the "science of man," or natural history of mankind; in the general classification of knowledge, the highest section of zoology or the science of animals, which is itself the highest section of biology or the science of living beings. To A. contribute the sciences of anatomy, physiology, ethics, sociology, prehistoric archaeology; although each of these branches of investigation pursues its own subject, having no further contact with A. than when its research concerns man. It is the office of A. to collect and set forth, as completely as possible, the synopsis of man's physical

and mental nature, and the theory of his course of life and action from his first appearance on the planet. Looking at man's place in nature, we see that the higher apes come nearest to him in bodily formation, and here it is the office of zoology to point out resemblances and differences, and to ascertain relations. "At this point," says prof. Owen, in a paper on the bony structure of apes, "every deviation from the human structure indicates with precision its real peculiarities, and we then possess the true means of appreciating those modifications by which a material organism is especially adapted to become the seat and instrument of a rational and responsible soul." Huxley, in comparing man with other orders of mammalia, decides—"There would remain then but one order for comparison, that of the apes, and the question for discussion would narrow itself to this: Is man so different from any of these apes that he must form an order by himself? Or does he differ less from them than they differ from one another, and hence must he take his place in the same order with them?" Here the reference plainly limits itself to the human body. Huxley compares man with the gorilla, which is on the whole the most man-like of all the apes. The gorilla has a smaller brain-case, larger trunk, shorter legs, and longer arms than man. The differences in the skulls are remarkably apparent. In the gorilla the face, formed largely by the massive jaw-bones, predominates over the brain-case; in man these proportions are reversed. In man the skull is set evenly on the spine, the spinal cord being just behind the center of the base of the skull; but in the gorilla, which usually goes on all-fours, the skull is inclined forward and the spinal cord is further back. In man the surface of the skull is nearly smooth, the ridges of the brow having but slight projection, while in the gorilla these ridges are enormous. The capacity of the largest gorilla skull yet measured was but 34½ cubic in.; that of the smallest human cranium is almost 63 in. The gorilla's large facial bones and great projection of jaws give its face a brutal expression, and its teeth differ from man's in size and in the number of fangs. The gorilla's arm is one sixth longer than its spine; man's is one fifth shorter. The legs differ not so much, but the hands and feet of the gorilla are longer than in man. The vertebral column and the narrow pelvis differ from those of man; the thumb is much shorter and the hand clumsier than man's. But a radical difference is in the amount of brain, that of the gorilla being 20 oz., while in man it is seldom less than 32. Prof. Huxley, restoring in principle the classification of Linnæus, would include man in the order of *primates*, and divide that order into seven families: 1, *anthropini*, consisting of man only; 2, *catarrhini*, or old world apes; 3, *platyrrhini*, including all new world apes except the marmoset; 4, *arctopithecini*, or marmosets; 5, *lemurini*, or lemurs; 6, *chiromyini*, or bats; and 7, *galeopithecini*, or flying lemurs.

In fixing man's place in nature on physiological grounds, much greater difficulty is met. There is here an enormous gulf between the most brute-like of men and the most man-like of apes; a chasm not to be accounted for by minor structural differences. The bold investigations and speculations of science have not yet been able to eradicate the opinion, deeply rooted in modern as in ancient thought, that only a distinctively human element can account for the wide severance between man and the highest animal below him. Mere mechanical differences do not explain the divergence. An ape with a man's hand and voice would still have to rise through a long structural growth to be indeed a man. The greater amount of brain in man comes nearer to explain the difference; but even that fails. In some of the senses man is quite inferior; he cannot equal the eagle in sight, the dog in scent, nor one of a dozen animals in hearing; though in the senses of tasting and feeling he may be superior to any of them. We must conclude that it is by superiority in quality, as well as in quantity, of brain, and, because of that superiority, by the possession of a highly organized language, that man has the power of co-ordinating the impressions of his senses, which enables him to understand the world in which he lives, and, by understanding, to use, resist, and rule it. This power of using what his senses reveal to him is clearly expressed by man in his language. He shares with beasts and birds the power to express feelings by emotional cries; the parrot approaches him in utterance; and by association of ideas, some of the lower animals understand to a certain extent what he says. But the abstract power of using words, in themselves meaningless, as symbols by which to convey complex intellectual processes—in which mental conceptions are suggested, compounded, combined, and even analyzed, and new ones created—is a faculty scarcely to be traced in any other animal than man.

That this power is a function of the brain has been fully proved in diseases of that organ, such as aphasia. This may stand among the best evidences that the brain is the principal, if not the sole, organ of mind. But animals of lower grade share with man in varying degree in many of the high attributes. Sudden terror affects man and beast alike; in both the muscles tremble, the breast palpitates, the sphincters are relaxed, and the hair stands up. Memory in some of its ranges in very strong is some animals, especially in elephants and dogs. Reasoning power is shown when the monkey breaks an egg softly and picks away the shell cautiously so as to preserve the entire contents. Monkeys also use mechanical defenses, throwing sticks and stones, and nuts from trees, at their enemies; and the wonderful mechanical instinct shown in nest-building by birds and insects must not be forgotten yet man rises above all this, and remains the only creature who is not subject to nature, but has knowledge and power to control and regulate his actions, and to keep in harmony with nature, not by a change of body but by

an advance of mind. The lower instincts which tend mainly to self-preservation are weaker in man than in many other animals, while philosophy, seeking knowledge for its own sake; morality, manifested in the sense of truth, the right, and virtue; and religion, the belief in, and communion with, some spiritual being above man, are human characteristics, of which the lower animals show at most but the faintest traces. Yet the tracing of physical and even intellectual continuity between the lower animals and man need not lead the anthropologist to lower the rank of man in the scale of nature.

Modern materialists are content to regard the intellectual functions of the brain and the nervous system as all there is to be considered in a psychological comparison of man with lower animals. They hold that man is a machine—wonderfully complex, to be sure, yet only a machine, provided with energy by force from without—which mechanically performs the acts for which it was constructed, such as eating, moving, feeling, and thinking. But their views are strongly opposed by those who combine spiritualism and materialism in the doctrine of a composite nature in man; animal as to the body, and in some degree as to the mind, or, as some term it, the soul; spiritual as to the soul or, as some prefer to call it, the spirit. Dr. Prichard sustains the time-honored doctrine which refers the mental faculties to the operation of the soul. Mivart, the comparative anatomist, says: "Man, according to the old scholastic definition, is a 'rational animal,' and his animality is distinct in nature from his rationality, though inseparably joined during life in one common personality. Man's animal body must have had a different source from that of the spiritual soul which informs it, owing to the distinctness of the two orders to which those two existences severally belong." In this view not life only but thought also is a function of the animal system, in which man excels all other animals as to the perfection of organization; but beyond this, man embodies an immaterial and distinctively spiritual principle which no lower creature possesses, and which makes the resemblance of the ape to him merely superficial. It is not our business to decide upon these conflicting doctrines, each of which has the support of many names high in science and philosophy.

Concerning the origin of man, opinion is divided between the two great schools of biology—that of creation and that of evolution. The old doctrine of the contemporaneous appearance on earth of all animals was long ago set aside by the researches of geology, and it is admitted that the animal kingdom, past and present, includes a vast series of successive forms, appearing and disappearing in the lapse of ages. Our subject requires us to ascertain what formative relation subsists among these species and genera—the last link of the argument reaching to the relation between man and the lower creatures preceding him in time. Agassiz admits that there is a manifest progress in the succession of beings, an increasing similarity between the living fauna, and among vertebrates especially an increasing resemblance to man. But among the causes of this succession of types he does not include parental descent: "the link by which they are connected is of a higher and immaterial nature, and their connection is to be sought in the view of the Creator himself," whose ultimate aim, to which all creation and progress was made auxiliary, was to introduce man as the crown of his work. This is the "creationist view." But the evolutionist maintains that successive species of animals, though never so diverse in appearance, are really connected by parental descent, having become modified in the course of successive generations. Lamarck says "man is co-descendant with other species of some ancient, lower, and extinct form." Darwin's conclusion that man is the descendant from some animal of the *simian* (monkey) stock is well known, though his qualification that "we must not fall into the error of supposing that the early progenitor of the whole *simian* stock, including man, was identical with, or even closely resembled, any existing ape or monkey," is not so widely recognized. The problem of the origin of man cannot be properly discussed apart from the full problem of the origin of species (see SPECIES). The likeness between man and other animals which both schools try to account for; the explanation of any interval with apparent want of intermediate forms, which seem to the creationists so absolutely a separation between species; the evidence of useless rudimentary organs, such as in man the external shell of the ear, and the muscles which enable some men to move their ears (which rudimentary parts the evolutionists hold to be explainable only as relics of an earlier specific condition)—these, which are the chief points in the argument on the origin of man, belong to general biology. The theory of evolution tends towards the supposition of ordinary causes (such as natural selection) producing modification in species; the theory of creation has recourse to acts of supernatural intervention. A middle course is suggested by Mivart: that man's body belongs to natural evolution; his soul to supernatural creation. But this compromise, though it seems to be gaining adherents, thus far fails to satisfy either school. There is no question, however, that evolution, as a distinct theory, apart from all supposed connection with materialism, is securing the assent of scientists. We wait to see whether the discovery of intermediate forms will go on till it produce a disbelief in any real separation between neighboring species, and especially whether geology can furnish traces of the hypothetical animal which was man's nearest ancestor, while not yet man.

Coming to look into the antiquity of man, we remember that it is only a few years since English-speaking people very generally accepted the chronology of archbishop Usher, and agreed, without investigation and almost without question, that the earth

and all that it contains was created 4004 years before the advent of Christ. That and all other known systems of chronology, as fixing the date of the earth's origin, have been entirely overthrown by geological and astronomical facts; and even as fixing the date of man's origin they have been with great force called in question, and by many investigators positively rejected. These last assert that it is useless to speculate as to years or even ages in order to fix dates. The asserted discovery of human bones and articles manufactured by men in strata holding the remains of the fossil species of elephant, rhinoceros, etc., would, unless disproved, inevitably lead to the inference that man existed during the life period of those animals. Further evidence has been found that seems to take man back to the quarternary or drift period; and such evidences are generally accepted by geologists as carrying back the existence of man at least into the period of the post-glacial drift, in what is now called the quarternary period, indicating an antiquity at the very least of tens of thousands of years. The 20 centuries of English and French history are counted but as a mere fraction of the time that has elapsed since the stone implements of prehistoric tribes were buried under beds of gravel and sand by the rivers now known as the Thames and the Somme. If we consider the geological formation of such valleys as those in which these rivers flow, and estimate from present data the time required for the rivers to dig such valleys, it follows that the drift beds and the men whose works they inclose must have had existence at a period so remote that any comparison with the received chronology of years and centuries is impossible, and the attempt to fix dates would be absurd. For the present we must be content to begin with "Once on a time." Still, certain inferences have been drawn that may be noted. A boring of 90 ft. in the Nile valley, reached pottery and burnt brick, showing that man in a fairly civilized state dwelt there so long ago that, at the rate of deposit by the river, it must have been several thousands of years. The lake dwellings of Switzerland—huts in number amounting to villages, built on piles in the water at some distance from the shore for safety against attack—indicate very remote antiquity; and the same may be said of the Danish remains of fire-places, or kitchen refuse heaps. Extant chronicles must also be noted. The oldest written records are hieroglyphic inscriptions, and the oldest can be hardly less, and may probably be much more, than 3000 years earlier than the Christian era. It is certain that more than 4000 years ago the Egyptian nation occupied a high plane in industrial, social, and political culture. The inscribed bricks of temples in Chaldea are of a date earlier than 2000 B.C., and Chinese civilization can be certainly traced back to a period anterior to 2000 B.C. Until recently it was the common opinion that the early state of society was one of comparatively high culture; but now the opinion is paramount that whatever may have been the earliest state, all recorded human civilization has been gradually developed from a state of barbarism. This hypothesis makes it necessary, it is claimed, to add 4000 to 5000 years to the earliest dates for Egyptian, Babylonian, and Chinese civilizations as generally traced. It is claimed, also, that much further time should be allowed during which the knowledge, arts, and institutions of these countries attained the level at which we fix their earliest dates. This view is thought to be strongly corroborated by philology. Hebrew and Arabic are closely related languages, neither of them being the parent of the other, but both the offspring of some earlier tongue. Therefore, when the Hebrew records have taken back to the most ancient admissible date the existence of the Hebrew language, this date must have been long preceded by that of the extinct parent language of the whole Semitic family; while this again may be considered to be the descendant of languages slowly shaping themselves through ages into this peculiar type. The evidence of the Aryan, or Indo-European, family of tongues is advanced as still more striking. The Hindoos, Medes, Persians, Greeks, Romans, Germans, Kelts, and Slavs make their appearance at dates more or less remote, as nations separate in language as in history. Nevertheless, it is now generally believed that in some high antiquity, before these nations were divided from the parent stock and distributed over Asia and Europe by the Aryan dispersion, a single barbaric people stood as physical and political representative of the nascent Aryan race, speaking an Aryan language, now perhaps extinct, from which, by a series of modifications not to be estimated as possible in any brief period, there arose languages which have been mutually unintelligible since the dawn of history, and between which only an age of advanced philology could trace the fundamental relationship. Combining these considerations, we find the basis claimed for the hypothesis that the furthest date to which writing, or rock inscriptions, or language, extends, is to be regarded as but the earliest distinctly visible point of the historic period, beyond which stretches back the unknown series of prehistoric ages. Advocates of the old chronology, while calling attention to the fact that many of these assertions are as yet hypotheses awaiting proof—and that some of the most important of them can be substantiated only on an ascertainment that present rates of geological formation and linguistic construction exactly decide the rate of progress under perhaps extremely diverse conditions in an unknown past—are yet not unready to concede that the old chronology must be regarded as uncertain in its starting-point, as well as indefinite in its terms, and as leaving gaps which are to be filled by an increasing knowledge. They demand, however, that these deficiencies be left unfilled until the undeniable facts are in hand for that purpose; and that till then, no merely probable hypothesis be accepted as of final authority. It should be observed that the Bible is not, as is commonly supposed,

responsible for archbishop Usher's chronology. That system is, of many possible systems equally accordant with the Bible, the one which has gained the widest acceptance.

In classifying the races of mankind, a number of systems have prevailed. The color of the skin is the first striking difference in showing race, and this distinction is found in ancient Egyptian portraits, and writers, ancient and modern, speak of white, yellow, and black races. The structure and arrangement of the hair is a better indication of race than the tint of the skin. Stature is an uncertain guide, for there are short and tall men in all races; still, an average rate of stature may indicate descent, and it is note worthy that people of Keltic origin in Great Britain are shorter than those of Teutonic descent (see ANTHROPOMETRY). The conformation of the skull has been used also, and careful measurements of form and capacity have been made; but shapes of the skull vary so greatly even in the same tribe, as to render this method of determining race practically worthless. The features, or general contour of the face, being at once apparent to the eye, are much used by scientific observers to determine race. Some of the most notable features, in contrast with European types, are seen in the oblique eyes of the Chinese, the pointed Arab chin, the Kirghis snub nose, the fleshy lips of the negro, and the broad ears of the Kalmuk. In Europe and America the Hebrews are distinguished by their peculiar features, and some physiognomists will undertake to select almost any nationality by mere examination of faces. The adaptation of a people to its climate forms a definite race-character, and typical instances of the relation of race-constitutions to particular diseases are seen in the liability of Europeans in the West Indies to yellow fever, from which, as has been thought, though scarcely proved, negroes are commonly exempt. Even the vermin infecting different races of men have been classified. Physical capabilities of races differ widely; but as the same is true of individuals of all races, such differences can hardly be used for race-classification. Two strongly marked mental contrasts are found in the shy and impassive Malay and the sociable and demonstrative Papuan. Classifications by race have been numerous, but all more or less imperfect, and some worthless. Blumenbach's "five races" is a widely known classification: Caucasian, Mongolian, Ethiopian, American, and Malay. Pickering made 11 races, Bory de St. Vincent 15, and Desmoulins 16; but no modern naturalist would accept any of these classifications. On the whole, probably Huxley's scheme more nearly than any other approaches to a classification that may be accepted in definition of the principal varieties of mankind, regarded from a zoological point of view. He makes four types: 1. The *Australoid*; chocolate-brown skin, dark brown or black eyes, black hair, narrow skull, brow-ridge strikingly developed, projecting jaw, coarselips, and broad nose. This type is best represented by native Australians, and the coolies of southern India. 2. The *Negroid*; chiefly the negroes of Africa; with dark brown to brown-black skin, eyes of like hue, hair usually black, crisp, and wooly; skull narrow, but orbital ridges not prominent, jaws projecting, nasal bones depressed, and thick lips. 3. The *Mongoloid*; prevailing over the area east from Lapland to Siam; of short build, yellowish-brown skin, black and straight hair, black eyes, broad skull, brow-ridges usually not prominent, small flat nose, or eyes set obliquely. 4. The *Xanthochroi*, or fair whites; skin almost colorless, blue or gray eyes, hair from straw color to chestnut, and skull large though variable in size. To these four general divisions he adds *Melanochroi*; much like the fair whites, but of smaller stature and darker shade of hair, eyes, and skin—such as the Kelts, the people of southern Europe, the Greeks and Arabs.

On the origin of races there has long been, and still continues, an earnest discussion. On one hand, it is claimed by monogenists that all men descended from a single pair; on the other, it is contended by polygenists that there were many primary species of separate origin. The monogenists rest upon the Bible, and point to Adam and Eve; the polygenists, while arguing from science, with equal confidence, show biblical passages from which they infer the existence of contemporaneous non-Adamite races; and even political science was called in to support the idea of more than one original race, when the institution of slavery in the United States was defended on the assumption that the negroes were a different race, inferior to the whites or the Indians. We do not enter into even a statement of the many variations of the human type, but observe that the general tendency of the evolution theory is against constituting separate species where the differences are moderate enough to be accounted as due to variations from a single type; while it is not inconsistent with evolution to claim that several distinct simious species may have culminated in several races of men. Still the drift of the evolution theory is towards unity of origin. Darwin says: "When naturalists observe a close agreement in numerous small habits, tastes, and dispositions, between two or more domestic races, or between nearly allied natural forms, they use the fact as an argument that all are descended from a common progenitor, who was thus endowed; and consequently that all should be classed under the same species. The same argument may be applied with much force to the races of man." The experience of the last few years countenances Mr. Darwin's prophecy, that before long the dispute between those who hold that all men came from one pair and those who hold to diverse originals, will die a silent and unnoticed death. [Portions of this article are, with modification, from *Encyclopædia Britannica*, ninth edition.]

ANTHROPOLOGY, besides its scientific application above noted, is used in theology to indicate the study of man in his relation to God. Under this head, some writers have

practically brought almost all theology under discussion. Perhaps the prevalent usage may be said to limit A. to a study of theological facts or principles in their relations to man considered psychologically—or to man considered as to the origin of his complex being, and as to the interaction of his spiritual and material elements.

**ANTHROPOMETRY** (the measurement of man), of late years much attended to by anthropologists, foremost among whom is Dr. A. Weisbach, chief physician to the Austro-Hungarian hospital in Constantinople. His measurements refer to 19 different peoples and more than 200 individuals from all parts of the earth, and take cognizance of the pulse, the length of the body, the circumference of the head, the height and length of the nose, as well as the comparison of the length of the arm and bones with each other. Thus, for example, the number of pulse-beats per minute varies within wide limits; the Congo negroes, 62, and, next to them, the Hottentots and Roumanians, 64, have the slowest pulses. Then follow the Zingani, 69; Magyars and Kafirs, 70; north Slavs, 72; Siamese, 74; Sundanese and Sandwich islanders, 78; Jews, Javanese, and Bugis, 77; Amboinese and Japanese, 78; and lastly, the Chinese, 79. The quickest pulses belong to the Tagals, 80; the Madurese and Nikobars, 84. As to height, the smallest among the peoples measured are the Hottentots, 1286 millimeters; this is far below any other people, as the next, the Tagals, are 1563. Then follow the Japanese, 1569; the Amboinese, 1594; Jews, 1599; Zingani, 1609; Australians, 1617; Siamese, 1622; Madurese, 1628; south Chinese, 1630; Nikobars, 1631; Roumanians, 1643; Sundanese; 1646; Javanese, 1657; Magyars, 1658; Bugis, 1661; north Slavs, 1674; north Chinese, 1675; and Congo negroes, 1676. The longest measurements, however, are found among the Sandwich islanders and Kanaks, 1700 millimeters; Kafirs, 1753; and the Maoris of New Zealand, 1757. To compare these with European peoples as to stature, we find that that of the English and Irish is 1690 millimeters; the Scotch, 1708; Swedes, 1700; Norwegians, 1728; Danes, 1685; Germans, 1680; French, 1667; Italians, 1668; and, lastly, Spaniards and Portuguese, 1658. The greatest circumference of the head is found among the Patagonians, 614 millimeters, and Maoris, 600. Following these are the Kafir, 575; Nikobars, 567; north Slavs, 554; Congo negroes, south Chinese, and Kanaks, 553; Tagals, Sundanese, and Roumanians, 552; Japanese, 550; Bugis and Jews, 545; Amboinese, 544; Javanese, 542; Hottentots, 540; and, lastly, the Zingani and Siamese, 539. Stature and circumference of head generally stand to each other in opposite relations; although there are exceptions, as in the case of the Siamese with small stature and small head, and the Patagonians with great height and large heads. The breadth of the root of the nose is found greatest among the Patagonians, 41 millimeters; less among the Congo negroes, 36; Australians, Maoris, and south Chinese, 35; Sundanese, Amboinese, Bugis, Nikobars, Tagals, and Kanaks, 34; north Chinese, Kafirs, north Slavs, Roumanians, Magyars, and Zingani, 33; Jews, Japanese, Siamese, Javanese, and Hottentots, 32. The Jews and Patagonians excel in length of nose, 71 millimeters. Following these are the Kanaks, 54; Roumanians, 53; north Slavs and Maoris, 52; Tagals, 51; Japanese and north Chinese, 50; Siamese, Magyars, Zingani, Madurese, 49; Amboinese, 48; Nikobars, 47; Sundanese, Javanese, south Chinese, Kafirs, 46; Hottentots, 44; Congo negroes, 42; Bugis, 41; and Australians, 30. The breadth of the nostrils gives quite another arrangement. Here we find the Australians excel, 52 millimeters; then come Congo negroes, 48; Kafirs and Patagonians, 44; Tagals, 42; Nikobars, 41; Hottentots and Sundanese, 40; Malay races, 39; south Chinese, 37; north Chinese, 36; Japanese, north Slavs, Roumanians, Zingani, 35; Magyars and Jews, 34. With regard to the bust, it is found that the North American Indians and the Polynesians excel all others in size. Next to them come the north, middle, and east Europeans; after them come the west Europeans, negroes, and after them the south Europeans, who are followed by the east Asiatics and Malays. Among European peoples, in respect of race, we find the narrowest chests among the Semites, followed in order by Romance, Kelts, Fins, Zingani, Germans, and Slavs. Interesting results are obtained by comparison of the length of arm and the leg-bones. Among east Europeans the leg-bones throughout are longer than the arm; among Australians, Polynesians, and especially east Asiatics and Patagonians, the leg-bones are shorter than the arm; among Africans, only, the Congo negroes have the leg-bones longer than the arm. See **ANTHROPOLOGY**.

**ANTHROPOMORPHISM** (from the Gr. *anthrōpos*, man, and *morphē*, a form), the application, in a figurative way, to God, of terms which properly relate to human beings. Thus, in the holy Scriptures, we read of the eye, the ear, the arm, the hand of God, and of his remembering, forgetting, etc. This A. appears to arise of necessity from our incapacity of forming conceptions of things spiritual, or finding any terms in which to express them, except by analogies derived from things cognizable by our senses, so that even the language of adoration is borrowed from the familiar things of this world. It must be evident, however, that A., employed in an unguarded manner, or too grossly understood, might lead to most serious error; and a tendency has manifested itself at various times in the history of the Christian church to ascribe to the Divine Being a form and parts like those of men. Thus, the Audæans (q.v.) or Audians, a Syrian monastic sect which sprang up in the 4th c., were accused, and, it would seem, justly, of holding that God was possessed of a human shape, and that, when the Bible said that "God created man in his own image," the words are to be understood of this shape

literally. The same error was at a later period ascribed to the Waldenses, but there is no evidence of the justice of the accusation. A tendency to A. may indeed be regarded as always existing, and so requiring to be guarded against in the mind of every man; but the instances have been rare and isolated, although they have from time to time occurred, in which anthropomorphic views have been fully adopted and openly expressed among Christians. The error of the anthropomorphites has, however, found countenance from the speculations of philosophers. Hobbes, Forster, and Priestley ascribed to the Divine Being a sort of subtle body. Fichte, on the other hand, rejected the very doctrine of the personality of the Divine Being as anthropomorphic, and represented God as the *moral order of the universe*; and Schelling, Hegel, Feuerbach, and Schleiermacher substituted for the objective personality of God a subjective consciousness of God in the human soul.—The term *anthropopathism* is sometimes employed to denote the ascription to God of human affections and passions, although A., in its most general sense, includes this. The language of Scripture, in the many instances of this kind, must be interpreted according to the same general principles which are applicable in those of A. strictly so called, with the same discrimination of the figurative from the literal, and the same constant recognition of the absolute spirituality and unchangeableness of God; yet so that important truths conveyed by means of such language, and which it is probable could only be conveyed to us by such language, in accordance with our mental constitution, may not be rejected or obscured. And here, it must be confessed, there is greater difficulty than with regard to A. strictly so called.

**ANTHROPOPHAGI.** See CANNIBAL.

**ANTHUS** and **ANTHIDE.** See PIPIT.

**ANTHYLLIS.** See KIDNEY VETCH.

**ANTIARIS** and **ANTJAR.** See UPAS.

**ANTIBES** (anciently *Antipolis*), a fortified seaport in the department of the Alpes Maritimes, in the s.e. of Provence, France, lat. 43° 34' n., long. 7° 8' e. Pop. '76, 5546. It stands on the e. side of a small neck of land called La-Garoupe, lying w. from the mouth of the Var, in a fertile district. The harbor is only serviceable, however, for small craft. It is a military station of the third rank, possesses a naval school, and has considerable trade in olives, dried fruits, salt fish, oil, etc. The anchovies prepared at A. are held in high estimation. The environs of the t. are beautifully adorned with gardens, vineyards, and orchards.

A. is a very old place, having been founded by a colony of Greeks from Massilia (Marseille), of which it was a dependency. In the time of Augustus it was elevated to the rank of an Italian city, and must have attained a high degree of prosperity, if we are to judge from the ruins that still exist. After the wreck of the old Roman empire, A. suffered the fate of all classic cities in that region, becoming subject to successive tribes of barbarians from the north. In the 9th c., it was destroyed by the Saracens; in the 16th c., it was fortified by Francis I. and Henry IV.; during the Austrian war of succession, it sustained a siege of three months (1746); and, in recent times, gained some notoriety from having closed its gates against Napoleon on his return from Elba.

**ANTICHLORINE** is the name given to commercial sulphite of soda by paper-makers. When the rags are reduced to a pulp, they are bleached by chloride of lime (bleaching-powder), which thoroughly soaks the pulp, and is very difficult to wash out. The traces of chlorine thus left in the pulp pass into the manufactured paper and tend to bleach the writing-ink which may be traced thereon. To free the pulp from the residue of the chlorine, some sulphite of soda is employed, and hence the name A., which literally signifies "against (*anti*) chlorine."

**ANTICHRIST** (from Gr. *anti*, against, and *Christos*, Christ). The general notion of A., as a power opposing itself to the reign of the Messiah, may be traced back beyond the Christian era. Its origin is perhaps to be found in the prophecy of Ezekiel concerning the doom of Gog and Magog. In accordance with the old saying, "When need is sorest, help is nearest," the Jews conceived that, immediately previous to the Messiah's reign, national adversity must be experienced in an extreme degree, and that an agent of Satan would appear, who must be overcome before prosperity could be restored. This was A. The idea is adopted in the New Testament, although the term A. occurs in no place of Scripture, except in the first and second epistles of John. From such passages as the prophecies of the Savior, Matt. xxiv. and Mark xiii., it has been inferred by some that probably the great truth which this conception was intended to shadow forth was similar to that illustrated in the life of "the man of sorrows"—that only through tribulation and strife could the reign of the Messiah be established; that Christ's kingdom, like Christ himself, could be made perfect only through suffering. And with this the language of John in his epistles, and of Paul in passages which seem to embody the same idea, is supposed to accord. Nor is it regarded as a fatal objection to this opinion, that in the Apocalypse the antichristian power or element is associated with the great heathen capital Rome, symbolically designated Babylon.

But this opinion neither has been nor is generally prevalent. The idea of A. early became associated with that of the millennium (q.v.), retaining a form very similar to that which it had among the Jews before the advent of the Messiah; and popular opinion

has always sought to find for it some actual and definite embodiment. In the 5th c., a popular delusion prevailed, founded on the passage in the Apocalypse, xvii. 8, that Nero was not dead, and would return in the character of A. Since the 16th c., the prevalent opinion among Protestants has been that A. is the Roman Catholic church; an idea entertained even at an earlier period, as, for instance, by Ludwig of Bavaria, regarding pope John XXII., by Occam, Wickliffe, and his pupil Cobham, and the Bohemian reformer Janow, and which seems to have prevailed to a considerable extent among the Hussites and other opponents of Rome. This opinion has, of course, been strenuously opposed by Roman Catholic writers, as by Bossuet, who, in his comments on the Apocalypse, ably advocates the opinion that pagan Rome was A. The opinions of Roman Catholics, however, are much divided upon this subject, many of them maintaining that A. is yet to come and "to raise the last persecution," as "no one has yet appeared to whom we can apply the character which the infallible word of God declares shall be that of the real A.—*Keenan's Catechism of the Christian Religion*.

The opinion prevalent among Protestants depends upon the identification of A. with the mystical Babylon of the Apocalypse, and with other symbolic representations in that book, of a power opposed to the cause of Christ, and also with the "wicked" one, the "man of sin," and "son of perdition," in 2d Thess. ii. Thus it is maintained that a definite embodiment of the idea of A. is to be sought in history, and that this is to be found in the church of Rome or in the papal power. And Protestants refer to the gradual growth and development of the errors which they regard as culminating in the church of Rome, as accordant with the declaration of Paul in 2d Thess. ii., that "the mystery of iniquity doth already work," and with that of John, "Even now are there many antichrists."

There have been, however, among Protestants eminent opponents of this opinion, among whom may be named Grotius. His own opinion was singular, that Caligula, the Roman emperor, was A. In the Greek church, the term A. has been understood as especially applicable to Mohammed, or to the dominion of the Turks and Saracens. Almost every great or striking event—the arrival of the year 1000; the beginning of the crusades; the "black death" and other plagues in the 14th c.; the career of Napoleon in 1805; and even the political movements of 1848 and 1849—has suggested new interpretations of the passages of Scripture regarding A. See REVELATION OF ST. JOHN.

ANTICLIMAX, in rhetoric, an abrupt declension by a writer or speaker from the dignity to which his idea has attained; as in the lines,

"The king of France, with twenty thousand men,  
Marched up the hill—and then marched down again."

It is intentionally employed in ridicule or satire. Sometimes it partakes of the nature of antithesis; as, "Die; and endow a college, or a cat."

ANTICLIN'AL AXIS, a geological term denoting an imaginary plane of division between those portions of a stratum which dip in opposite directions downwards from a ridge lying between them.

ANTI-CORN-LAW LEAGUE, the name adopted by an association which concentrated the efforts of the free-trade party in Britain, and enabled them to carry the repeal of the corn-laws, and establish in practice the principle of free-trade. The results thus accomplished will have to be considered under other heads, as CORN-LAWS, FREE-TRADE, etc. This statement is limited to a brief account of the league itself, and its method of working. Associations to obtain the repeal of the corn-laws existed in several places before the embodiment of the league—one especially was founded in London in 1834. In 1838, Mr. Cobden and others took the opportunity of the periodical assemblages of the Manchester chamber of commerce for exposing the deleterious influence of the restrictive commercial policy on the manufactures and trade of the country. The friends of free-trade, at the same time, occasionally met in Manchester to discuss and promulgate their views; but it was in the beginning of 1839 that the strength of the party was first drawn to a focus by the appointment of delegates from the manufacturing districts to proceed to London, and press their principles on the legislature. Mr. Charles Villiers, afterwards president of the board of trade, undertook the leadership of their cause in the house of commons, of which Mr. Cobden, who subsequently served it so effectively, was not then a member. On the 19th of Feb., Mr. Villiers moved that the house resolve itself into a committee of inquiry on the corn-laws; and again, on the 12th of Mar., he moved that certain manufacturers be heard by counsel at the bar of the house against the corn-laws, as injurious to their private interest. The former motion was rejected by 342 to 195; the latter, by 361 to 172. Immediately on the return of the delegates from their unsuccessful effort, the league was formed. Its constitution dates from the 20th Mar., 1839, when resolutions were adopted, at a meeting in Manchester, for "the formation of a permanent union, to be called 'the anti-corn-law league,' composed of all the towns and districts represented in the delegation, and as many others as might be induced to form anti-corn-law associations, and to join the league.

"Delegates from the different local associations to meet for business from time to time at the principal towns represented.

"With the view to secure unity of action, the central office of the league shall be established in Manchester, to which body shall be intrusted, among other duties, those of engaging and recommending competent lecturers, the obtaining the co-operation of the public press, and the establishing and conducting of a stamped circular, for the purpose of keeping a constant correspondence with the local associations."

It was resolved that, in addition to the funds which local associations might provide for their own district purposes, £5000 should be put at the disposal of the central body, and that every person, or collection of persons, contributing £50, should have one vote in its deliberations. The league collected and distributed large sums of money. Just before its principles became triumphant in the free-trade legislation of 1846, it demanded a quarter of a million, which would have been supplied had it been necessary.

It is of the greatest moment that the cause of the success of the league should not be misunderstood: it triumphed not by possessing money, but by teaching scientific truth. It was a great organization for educating the country in political economy. The leading principles of this science were so little known when the league began, and had been so effectually promulgated before its end, that a majority of the parliament who, in 1841, had been elected for the support of protection, were converted to free-trade, the conversion including the prime-minister, Sir Robert Peel. The key-note to the literature of the league was struck by the beautiful logical exposition of free-trade in gen. Thompson's *Catechism of the Corn-laws*, which, with other tracts, was profusely dispersed over the country, while a large staff of lecturers aided in the task of education. Thinking to serve their cause in the same manner, the protectionist party, at a meeting held in the duke of Somerset's house, on 17th Feb., 1844, founded "the agricultural protection society of Great Britain." This body had inexhaustible wealth at command, but in reality its exertions only helped to further the cause of free-trade, by promoting discussion, and prompting people to work out the question for themselves.

**ANTICOSTI**, an island in the gulf of St. Lawrence, with light-houses at different parts of the coast, between lat. 49° and 50° n.; and long. 61° 40' and 64° 30' w. It is estimated to contain 2500 sq.m. Neither to the settler nor to the mariner is A. of any value. It is destitute of harbors, the n. shore being mountainous, and the s. low and beset by shoals; while, to increase the danger, the neighboring currents are said to be capricious. The climate is severe; while the surface is an alternation of rocks and swamps. The principal inhabitants are the keepers of the light-houses. Pop. '71, 102. The island is surrounded by considerable salmon, trout, cod, and herring fisheries. It is a valuable resort for seal and bear hunting. The most extensive peat deposits in the dominion are found in A. Marl also exists in most of the small lakes and ponds along the coast.

**ANTICYRA**, a city of Phocis on the Corinthian gulf. The people were expelled by Philip of Macedon, and subsequently it fell under the Romans. The site is yet discernible, and is known as Aspra Spitia, or the white houses.—Another A. was a city of Thessaly, famous for producing hellebore, which was deemed a cure for madness.

**ANTIDOTE** (Gr., given against), a counter-poison. See POISONS.

**ANTIETAM, BATTLE OF**, Sept. 17, 1862: one of the most important conflicts in the war of the rebellion in the United States, 1861-65. The name is taken from a small but deep river in Maryland, emptying into the Potomac, 6 m. above Harper's ferry. The battle was the result of an attempt of the confederates to capture the city of Washington, in the expectation that Maryland would then join their cause and insure final victory. The federal army was commanded by gen. George B. McClellan, and the confederates by gen. Robert E. Lee. On the 4th, 5th, and 6th of Sept., the confederates crossed the Potomac near Leesburg, and occupied Frederick and the country along the Monocacy. McClellan threw a part of his army between them and the fords of the Potomac, forcing Lee to leave Frederick on the 12th, the latter marching towards Hagerstown. On the 10th "Stonewall" Jackson, the confederate general, had moved by forced marches towards Harper's ferry, which important position with 12,000 men surrendered to him on the 15th. Meanwhile the federal army followed Lee towards the north, and on the 14th took Crampton's gap and the heights of South mountain, forcing Lee to retreat over the Antietam to Sharpsburg. On the 16th the federals under gen. Hooker gained advantage in a sharp engagement, and on the 17th the real battle was begun by Hooker, who drove back the left wing of the confederates under Jackson, while gen. Burnside engaged their right wing. The battle raged around a corn-field surrounded by woods, to which Hooker had driven the enemy. The federal troops were twice repulsed, but gained the position on the third attack. Hooker was wounded, and the command fell to gen. Sumner. Meanwhile on the extreme left Burnside had twice unsuccessfully tried to cross the A., but at 3 p.m. drove the enemy until a range of hills occupied by batteries checked him. At 4 o'clock he was ordered to take the position at any cost, and took the first battery. But the arrival of gen. A. P. Hill's division strengthened the confederates, and Burnside reported that he could not hold his position if not assisted by McClellan with the federal reserve. McClellan did not heed this demand, and the federals were driven back to the bridge, which the confederates declined to attack. When darkness ended the contest, the federals had gained advantages at most points, but not a decided success. In the morning Lee asked and was granted a truce to bury

the dead, and while this was going on he retreated to the right bank of the Potomac, without serious resistance. The federal force numbered 87,164, and that on the other side is variously stated from 40,000 to 90,000. The federal losses were 2010 killed and 10,459 wounded; the confederate losses have never been ascertained, though some of their writers put 9000 as the total. The result was to put the confederates on the defensive, and to hasten the emancipation proclamation, then contemplated by president Lincoln.

**ANTIGONE**, a character of the heroic age of Greece, daughter of Œdipus by his own mother Jocasta, was sister to Eteocles, Polynices, and Ismene. She accompanied her father in his exile into Colonus in Attica, and after his death returned to Thebes. Eteocles, the king, had banished his brother Polynices, who, coming back with an army, engaged him in single combat. Both fell, and Creon, who after their death had become tyrant of Thebes, issued an edict forbidding their interment. A. alone dared to disobey. She buried Polynices, and was in consequence seized by the monster, who shut her up, either in the same tomb with her brother, or in a subterranean cave, where she perished. This sentence threw Hæmon, son of Creon, who was betrothed to A., into such despair that he destroyed himself. A., as the ideal of feminine duty and filial devotion, has been immortalized by Sophocles in his dramas of *Œdipus at Colonus* and *Antigone*.—A., daughter of Eurymion, and wife of Peleus, who hanged herself upon hearing a false report of her husband's marriage to Sterope, daughter of Acastus.—A., daughter of Laomedon, and sister of Priam, who, having offended Juno by comparing her own beauty to that of the goddess, had her hair turned into snakes, which so tormented her, that the gods, in compassion, changed her into a stork.

**ANTIGONISH**, a co. in n.e. Nova Scotia; 500 sq.m.; pop. 71, 16,512. Coal is one of the chief products. The capital of the same name; pop. 4000.

**ANTIGONUS**. Of the numerous persons who bore this name, the most celebrated was the son of Philip of Elymiotis, and one of the generals of Alexander the great. In the division of the empire which followed the death of his master, A. received the provinces of Phrygia-Major, Lycia, and Pamphylia. Being accused of disobedience by Perdiccas, who wished to gain possession of all the territories left by Alexander, A. entered into alliance with Craterus, Antipater, and Ptolemæus, and declared war against Perdiccas in 321 B.C. In the same year, Perdiccas was assassinated by his own soldiers; but A. carried on the war against Eumenes, to whom Perdiccas had given rule over Paphlagonia and Cappadocia. Eumenes, and afterwards Seleucus, who reigned in Syria, were deposed by A., whose ambition and cupidity now knew no bounds. He seized the treasures of Alexander kept at Ecbatana and Susa, which he refused to share with his allies, Ptolemæus, Cassander (son of Antipater), and Lysimachus. All the other generals now allied themselves against him, and a long series of contests took place in Syria, Phœnicia, Asia Minor and Greece, which ended with the battle of Ipsus in Phrygia (301 B.C.), when A. was slain, in his 81st year.

**ANTIGONUS DOSON**, son of Demetrius, great-grandson of Alexander the great. He became regent or king of Macedonia during the minority of his cousin Philip, 229 B.C. As general-in-chief of the Achaean leagues he gained victories over Cleomenes of Sparta and his allies in the Peloponnesus. He d. in 220 B.C., leaving the throne to Philip.

**ANTIGONUS GONATAS** was the son of Demetrius Poliorcetes, king of Macedonia, and grandson of the great Antigonus. On his father's death, B.C. 283, various claimants for the throne appeared, and much confusion ensued, the result of which was that the royal power fell into the hands of Ptolemæus Ceraunus, who, however, soon after perished in a battle with the Gauls, when A. G. at length became ruler of the country (277 B.C.), and governed precariously in that age of intrigue, dissimulation, and violence for 33 years. He was twice expelled from his dominions by a hostile force from Epirus, but found refuge and assistance in the Peloponnesus. The close of his career was comparatively peaceful. He d. in 243 B.C.

**ANTIGUA**, a West India island, the most important of the Leeward islands (see ANTILLES), and the residence of the governor-in-chief of the British portion of the group. It lies in w. long., between 61° 44' and 61° 58'; and in n. lat., between 17° 2' and 17° 13'. Its area was estimated, in 1870, at 117,120 acres, of which about 100,000 were under cultivation. In 1871, the population of A. was 34,344, yielding to a sq.m. an average of exactly 318 inhabitants. It was first settled in 1632, having till then remained, in fact, uninhabited on account of the great scarcity of fresh water. It has twice suffered severely from earthquakes—in 1689 and 1843; while of hurricanes also, the other heavy scourge of the group, A. has had its full share. Numerous islets, rocks, and shoals border the shore, so that, generally speaking, access is difficult and dangerous. But St. John's, the chief t., stands at the head of a safe and capacious bay, which unfortunately, however, does not admit large vessels. English Harbor is, on the whole, a more commodious port, and has been selected as the station of the royal mail steam-packets. It is said to be capable of receiving the largest ships in the British navy.

A. is chiefly of tertiary formation. The s. and w. show grauwacke, porphyry, trap, breccia, amygdaloid, and basaltic greenstone; the n. and e. exhibit calcareous marl and

coarse sandstone, interspersed with blocks of limestone; while the interior presents argillaceous strata and irregular beds of coarse flint.

Besides provisions, generally almost sufficient for its own consumption, A. produces large quantities of sugar, molasses, and rum. In this respect, the emancipation of the slaves appears to have been rather beneficial than otherwise. In 1875, the total tonnage of vessels (exclusive of the coasting-trade) which entered and cleared A. was 60,577, and of these 50,913 were British, and the other 9664 foreign. The total value of imports was, in the same year, £180,363; of exports, £240,677. The sugar exported in 1873 amounted in value to £121,778. The value was, in 1856, £301,740; in 1863, £199,832; and in 1867, £87,393.

In connection generally with the emancipation of the slaves, of whom, immediately previous to the abolition of slavery, A. had about 30,000, it seems to have occupied a prominently creditable position. Immediately after the passing of the imperial statute on the subject, the local legislature, rejecting the intermediate and probationary state of apprenticeship, proclaimed unqualified freedom for 1st Aug., 1834—a bold measure, which proved to be as judicious as it was humane.

ANTILEGOMENA, a name given by the early Christian writers to those books of the New Testament which, though sometimes read in the churches, were not for a time admitted to be genuine or received into the canon of Scripture. They were: epistle to the Hebrews, epistle of James, second epistle of Peter, second and third epistles of John, epistle of Jude, and the book of the revelation of John.

ANTI-LIBANUS, or ANTI-LEBANON, a mountain ridge in Palestine and Syria, about 90 m. long, running n.e. and s.w. nearly parallel with the Lebanon ridge, from which it is separated by the valley of Cælo-Syria. Mt. Hermon is the highest peak, 9000 or 10,000 ft., on whose sides rises the river Jordan. The A.-L. is lower than the Libanus range, and less continuous.

ANTILLES, a term used to designate generally the whole of the West India islands, except the Bahamas. Generally speaking, they stretch eastward from the gulf of Mexico to about the meridian of the gulf of Paria; then southward to the gulf of Paria itself; and lastly, westward to the gulf of Maracaybo. Primarily, however, they are regarded not as three sections, but as two—the greater A., to the n. and w.; and the lesser, to the e. and the s. This distinction, which obviously involves considerations of position as well as of magnitude, will be found to indicate also a difference of organic structure.

The greater A., reckoning from the w., are: Cuba (Spanish), Jamaica (British), Hayti (independent), and Porto Rico (Spanish). They extend in w. long. from 84° 58' to 65° 40', and in n. lat. from 23° 9' to 17° 40'—the higher of these two parallels being only 21', or about 25 m., within the tropic of Cancer. On the lowest estimate, the area is said to amount to 70,000 sq. m. The greater A. appear to be of primitive formation, presenting lofty granitic mountains. In Jamaica, however, there are many hills of calcareous origin.

The lesser A. may be divided into two chains—the eastern, trending round from the eastward of Porto Rico to the gulf of Paria; and the southern, stretching away in a direction nearly parallel with that of the greater A., along the coast of Venezuela as far as the gulf of Maracaybo. By the Spaniards, followed by some other nations, the latter chain is termed the Leeward islands, and the former the Windward islands. In English and French phraseology, however, the Leeward islands are all those to the n. of 15° n. lat., and the Windward islands all those s. of that parallel.

In the latter sense of the name, the Leeward islands, reckoning from the n., come in pretty nearly the following order: Virgin islands (Danish and British), Anegada (British), Anguilla (British), St. Martin (French and Dutch), St. Croix (Danish), Saba (Dutch), St. Bartholomew (French), St. Eustatius (Dutch), Barbuda (British), St. Christopher's (British), Nevis (British), Antigua (British), Montserrat (British), Desadea (French), Guadeloupe (French), Marie Galante (French), Dominica (British). They extend in w. long. from 65° 30', at the w. extremity of the Virgin isles, to 61° 23', at the e. extremity of Dominica; and in n. lat. from 18° 48', at the n. extremity of Anegada, to 15° 10', at the s. extremity of Dominica. The area is about 5000 sq. m.

The Windward islands, reckoning from n. to s., and then from e. to w., may be given as follows: Martinique (French), St. Lucia (British), Barbadoes (British), St. Vincent (British), Grenadines (British), Grenada (British), Tobago (British), Trinidad (British), Testigos (Venezuelan), Margarita (Venezuelan), Tortuga (Venezuelan), Blanquilla (Venezuelan), Buen Ayre (Dutch), Curaçoa (Dutch), Aruba (Dutch). They extend in w. long. from 59° 20', at the e. of Barbadoes, to 70° 11', at the w. of Aruba; and in n. lat. from 11°, at the s. of Margarita, to 14° 55', at the n. of Martinique. Their entire area cannot exceed 1500 sq. m. The Windward islands, in the Spanish sense of the term, are otherwise called the Caribbees; and hence the sea which they cut off from the open Atlantic is called the Caribbean sea (q. v.).

The lesser A., as a whole, appear to be chiefly of coral formation, or of volcanic origin. Many of them contain extinct craters; and, though not destitute of harbors, their coasts are rendered in a great measure inaccessible by reason of reefs.

The A. generally—but perhaps the lesser more so than the greater—are subject to

hurricanes and earthquakes. Their principal productions are sugar, rum, cotton, coffee, etc. The individual islands will be found noticed in detail in their respective places.

The name A. is generally supposed to have been given by mistake to the West Indian islands. Before the discovery of America by Columbus, a tradition existed that far to the w. of the Azores there lay a land called Antilla, whose position was vaguely indicated in the maps of the early cosmographers. Only eight months after Columbus's return we find one Peter Martyr writing that the islands which the great navigator had touched upon must be the Antillæ; and it is certain that Cuba and Hayti were known as such before a single link in the Caribbean chain was discovered.

**ANTILOPE.** See ANTELOPE.

**ANTI-MASONS.** the name of a political party in New York and other states, organized in 1827-28. It was the result of a remarkable excitement over the fate of William Morgan, a tailor of Batavia, N. Y., who was said to be about to publish, or betray, the secrets of the masonic order, of which he was a member. He disappeared suddenly, and his fate has never been satisfactorily explained. There was a search, and he was traced to the Niagara river, near which it was discovered that he had been temporarily in prison. The opponents of freemasonry declared that he had been murdered, and sunk in the river or lake. Legal inquiries followed, but proved nothing. At or about that time the governor of the state was a mason of the most advanced degrees, and probably a majority of all public officers were members of the order. A wild excitement grew up in western New York, and the anti-masonic party was formed, casting 23,000 votes in 1828, about 70,000 in 1829, and 128,000 in 1830, though many in the latter year were anti-Jackson men, without reference to masonry. In 1832, the party nominated William Wirt for president, but carried only one state, Vermont. In 1835, through a democratic split, they elected the governor of Pennsylvania. After this the party fell as rapidly as it rose, and has not since made any conspicuous figure in politics. A great majority of the anti-masons became members of the whig party.

**ANTIMONY**—*symb. Sb* (Lat. *Stibium*) equiv. 122—is a brittle metal of a flaky, crystalline texture and a bluish-white color. It is readily reduced to powder by ordinary pulverization; when heated to 840° F. it fuses, and thereafter being allowed to cool, it solidifies in rhombohedral crystals, which are isomorphous with those of arsenic. Heated in a retort, where the oxygen of the air is excluded, as in an atmosphere of hydrogen, A. volatilizes as the vapor of the pure metal. When raised in temperature in contact with the air, it burns with a white light—combining with the oxygen of the atmosphere, and forming copious white fumes of the teroxide of A., or “flowers of A.” The metal is a bad conductor of heat and electricity, but may be used, in conjunction with bismuth, in the construction of thermo-electric piles. Exposed to the air at ordinary temperatures, A. does not tarnish or rust; and this property, combined with the hardness of the metal and of its compounds, renders A. of essential service in the useful arts, in the construction of alloys, such as britannia metal, type metal, and plate pewter. It is likewise employed in the preparation of the large concave mirrors used in astronomical observations; and in the casting of bells, to make them harder and whiter, and to give them a clearer and stronger sound.

The principal natural sources of A. are—*gray* or *crude* A. of commerce, which is the impure tersulphuret of A. ( $SbS_3$ ); and *native* A., in which it occurs in the metallic state associated with silver, iron, and other metals. The extraction of A. from its ores is mainly carried on at Linz in Germany, where the sulphide of A. is found extensively, and in Great Britain, which receives its supply of ore from Singapore and Borneo, commonly as ballast. The process consists in heating the crude ore, covered with charcoal, on the bed of a furnace, when the sulphide of A. fuses, leaving unmelted the earthy impurities; and thereafter the liquid is drawn off into iron molds, where it solidifies into cakes or loaves. The latter are reduced to coarse powder, placed on the bed of a reverberatory furnace, and heated with access of ordinary air containing oxygen, when the sulphur passes away as gaseous sulphurous acid ( $SO_2$ ), leaving behind the A. as the teroxide ( $SbO_3$ ). The roasted mass is now mixed with one sixth of its weight of powdered charcoal, the whole moistened with a solution of carbonate of soda, and raised to bright redness in crucibles, when the metal A. trickles to the bottom, and the impurities are left above in the spent flux or scoria, which is known in the arts by the name of *crocus* of A.

The compounds of A. are numerous: with oxygen it forms (1) the *teroxide* of A., or *white A. ore* ( $SbO_3$ ), which enters into the composition of tartar emetic; (2) *antimonious acid* ( $SbO_3$ ), which forms one of the components of Dr. James's powders; (3) *antimonic acid* ( $SbO_5$ ), a very insoluble compound, obtained by acting upon the metal with concentrated nitric acid. With sulphur, A. forms the *tersulphide* ( $SbS_3$ ) already referred to as a natural ore of the metal, and which, when roasted at a temperature sufficient to fuse it, passes into the mixed teroxide and tersulphide of A. known commercially as the *glass* of A. A native oxysulphide, of a pretty red color, is called *red A. ore*. When the ordinary sulphide of A. is boiled with potash, or the carbonate of potash, it dissolves, and thereafter, on boiling, deposits a reddish-brown substance known as *mineral kermes*. The liquid from which the deposit has fallen, if treated with hydrochloric acid, throws down an orange precipitate of *golden sulphide* of A.

There is also a chloride of A. ( $\text{SbCl}_3$ ) prepared by heating sulphide of A. and hydrochloric acid together, and which has the common name of *butter* of A. It is generally obtained as an oily liquid, of the consistence of melted butter, and of a golden yellow color. Mixed with olive oil, it is used by gunmakers as *bronzing salt*, to impart a yellow color to gun-barrels. The surface of the metal is afterwards polished by a burnisher, or coated with a varnish.

The various compounds of A. are used as medicinal agents, both in human and veterinary practice, especially the *tartar emetic*, a compound of teroxide of A., potash, and tartaric acid ( $\text{SbO}_3, \text{KO}, \text{T}$ ).

**ANTINOMIANISM** (Gr. *anti*, against, and *nomos*, law), the doctrine or opinion that Christians are freed from obligation to keep the law of God. It is generally regarded by the advocates of the doctrine of justification by faith, as a monstrous abuse and perversion of that doctrine, upon which it usually professes to be based. From several passages of the New Testament, as Rom. vi., and 2 Pet. ii. 18, 19, it would seem that a tendency to A. had manifested itself even in the apostolic age; and many of the Gnostic sects were really antinomian, as were probably also some of the heretical sects of the middle ages; but the term was first used at the time of the Reformation, when it was applied by Luther to the opinions advocated by John Agricola. Agricola had adopted the principles of the reformation; but in 1527 he found fault with Melancthon for recommending the use of the law, and particularly of the ten commandments, in order to produce conviction and repentance, which he deemed inconsistent with the gospel. Ten years after, he maintained in a disputation at Wittenberg, that as men are justified simply by the gospel, the law is in no way necessary for justification, or for sanctification. The "Antinomian Controversy" of this time, in which Luther took a very active part, terminated in 1540 in a retraction by Agricola; but views more extreme than his were afterwards advocated by some of the English sectaries of the period of the commonwealth; and, without being formally professed by a distinct sect, A. has been from time to time reproduced with various modifications. It ought, however, to be borne in mind that the term A. has no reference to the *conduct*, but only to the *opinions* of men; so that men who practically disregard and violate the known law of God, are not therefore antinomians; and it is certain enough that men really holding opinions more or less antinomian, have in many cases been men of moral life. It is also to be observed that the term A. has been applied to opinions differing very much from each other. In its most extreme sense it denotes the rejection of the moral law as no longer binding upon Christians; and a power or privilege is asserted for the saints to do what they please without prejudice to their sanctity; it being maintained that to them nothing is sinful; and this is represented as the perfection of Christian liberty. But besides this extreme A., than which nothing can be more repugnant to Christianity, there is also sometimes designated by this term the opinion of those who refuse to seek or to see in the Bible any positive laws binding upon Christians, and regard them as left to the guidance of gospel principles and the constraint of Christian love; an opinion which, whatever may be thought of its tendency, is certainly not to be deemed of the same character with the other. Probably, the A. that does not arise out of a dislike of morality, usually originates in mistaken notions of Christian liberty, or in confusion of views as to the relation between the moral law and the Jewish law of ceremonial ordinances.

**ANTINOMY**, the word used by Kant to mark the inevitable conflict or contradiction into which, in his view, the speculative reason falls with itself when it seeks to conceive the complex of external phenomena, or nature, as a world or cosmos. Literally, the word means a conflict or opposition of laws. It is used by Kant both in a generic, and in a specific sense; the necessity that lies upon the speculative endeavors of human reason taking the form of four special contradictions. For the generic sense Kant also has the word *Antithetic*, each antinomy being set forth in the shape of thesis and antithesis, with corresponding demonstrations, the perfect validity of which, in all cases, he positively guarantees. Briefly, his theses are: The world (1) is limited in space and time, (2) consists of parts that are simple, (3) includes causality through freedom, (4) implies the existence of an absolutely necessary being. Over against these stand the antitheses: The world (1) is without limits in space or time, (2) consists of parts always composite, (3) includes no causality but that of natural law, (4) implies the existence of no absolutely necessary being. Kant overcomes these antinomies by showing that the contradiction is not real if critically considered with due discrimination between noumena and phenomena. Sir William Hamilton's view, in his *Philosophy of the Conditioned*, is not the same as Kant's theory of A., though a connection is traceable between the two.

**ANTINOUS**, a beautiful youth of Claudiopolis, in Bithynia. He was page to the emperor Hadrian, and the object of his extravagant affection, accompanying him in all his travels, but was either drowned accidentally in the river Nile, or as some suppose, committed suicide from a loathing of the life he led, in 123 A.D. His memory and the grief of the emperor were perpetuated by many statues and bas-reliefs, of which several are very beautiful, especially two now in Rome—one found in the baths, and the other in the villa of Hadrian. "In all figures of A.," says Winckelmann, "the face has a rather melancholy expression; the eyes are large, with fine outlines; the profile is gently

sloped downwards; and the mouth and chin are especially beautiful." The city of Besa, in the Thebais, near to which A. was drowned, was also rebuilt by Hadrian, and the name of Antinoöpolis conferred upon it, in memory of his favorite. A. was further enrolled amongst the gods, and temples erected to him in Egypt and Greece.

**ANTIOCH**, the ancient capital of the Greek kings of Syria, was the most magnificent of the 16 cities of that name built by Seleucus Nicator. Its situation was admirably chosen. The river Orontes, issuing from the mountains of Lebanon, flows n. as far as the 36th parallel of lat., and then s.w. into the Levant. On the left bank of the river, after it has taken this last direction, and at a distance of 20 m. from the sea, lay the famous city, in the midst of a fertile and beautiful plain, 10 m. long by 5 broad. By its harbor, Seleuceia, it had communication with all the maritime cities of the west, while it became, on the other hand, an emporium for the merchandise of the east; far behind it lay the vast Syrian desert, across which traveled the caravans from Mesopotamia and Arabia. On the north, the plain of A. is bounded by the mountain-chain of Amanus, connected with the south-eastern extremity of Mt. Taurus; and on the s., which is more rocky, by the broken declivities of mount Casius, from which the ancient town was distant less than 2 miles. In early times, a part of the city stood upon an island, which has now disappeared. The rest was built partly on the plain, and partly on the rugged ascent towards mount Casius. The slopes above the city were covered with vineyards, while the banks of the river displayed, as they do even at the present day, a gorgeous profusion of eastern fruit-trees. The ancients called it "A. the beautiful," "the crown of the east," etc. It was a favorite residence of the Seleucid princes and of the wealthy Romans, and was famed throughout the whole world for the abundance of its conveniences and the splendor of its luxury. It received from Strabo the name of *Tetrapolis*, on account of three new sites having been successively built upon, and each surrounded with a wall. Its public edifices were magnificent. The principal were—the palace; the senate-house; the temple of Jupiter, burnished with gold; the theater, amphitheater, and Caesarium, besides an aqueduct, a public promenade, and innumerable baths. At the beginning of the Roman empire, it was as large as Paris, and for many generations after, continued to receive numerous embellishments from the emperors. Nor did its glory fade immediately after the founding of Constantinople, for though it then ceased to be the first city of the east, it rose into new dignity as a Christian city. Ten councils were held in it. Churches sprang up exhibiting a new style of architecture, which soon became prevalent; and even Constantine himself spent a considerable time here, adorning it, and strengthening its harbor, Seleuceia. The Antiochenes themselves, however, brought about the ruin of their beautiful city. They were famous, above all other people in ancient times, for their biting and scurrilous wit, and for their ingenuity in devising nicknames; and when the Persians, under Chosroes, invaded Syria in 538 A.D., the Antiochenes could not refrain from jesting at them. The Persians took ample revenge by the total destruction of the city, which, however, was rebuilt by Justinian. The next important event in its history was its conquest by the Saracens in the 7th century. In the 9th c. it was recovered by the Greeks under Nicephorus Phocas, but in 1084 it again fell into the hands of the Mohammedans. The crusaders besieged and took it on the 3d of June, 1098. At the close of the 13th c., the sultan of Egypt seized it: since then it has undergone a variety of vicissitudes, and at present forms a portion of Syria, in the eyalet of Aleppo. Its modern name is *Antakieh*. It exhibits almost no traces of its former grandeur, except the ruins of the walls built by Justinian, and of the fortress erected by the crusaders. Its manufactures are few and unimportant. In 1872 A. was mostly destroyed by an earthquake, and the pop., which was then estimated at about 17,000, was in consequence greatly reduced.

**ANTIOCH COLLEGE**, at Yellow Springs, Green co., Ohio, was incorporated in 1852, and opened to students in 1853. Its buildings, erected at a cost of \$150,000, occupy a pleasant, healthful site. Much of its endowment was received from Unitarians. Its founders designed to afford the means of a sound education at the least cost, and that its teaching should be religious, without being sectarian. Both sexes are admitted, and their co-education has proved satisfactory. Some of its lady graduates have taken high rank as teachers in other institutions. Its presidents have been Horace Mann, LL.D., 1852-59; Thomas Hill, D.D., 1859-62; Geo. W. Hosmer, D.D., 1866-72; Edward Orton, PH.D., 1872-76; Samuel C. Derby, the present incumbent. The whole number of instructors is 10. The average number of pupils in all departments for seven years past has been about 170. Free tuition is offered to one young man and one young woman, annually, from each of the high-schools in Ohio.

**ANTIOCHUS**, a common Greek name, was borne by 13 kings of Syria, 4 kings of Commagene (a small country between the Euphrates and Mt. Taurus), and many other persons of note (see Smith's *Dictionary of Greek and Roman Biography*). A. Soter, the first of the Syrian dynasty, or Seleucidae, as they were called from their founder, was the son of Seleucus, the general and one of the successors of Alexander. A. was the fruit of one of those marriages which Alexander celebrated at Susa between his generals and the princesses of Persia. His mother's name was Apama. From this fact we gather that A. was probably born in 324 B.C. For the earlier career of A., see **SELEUCUS**. On the murder of his father in 280 B.C., A. succeeded him in his dominions, but he after-

wards permitted Antigonus Gonatas to retain possession of Macedonia on his marrying Phila, a daughter of Seleucus. A. was much occupied in wars with the Gauls, who invaded Asia Minor, and, on one occasion, is said to have gained a victory over them by the help of his elephants, from which circumstance he derived the name of Soter (savior). He was subsequently killed in a battle with the Gauls (261 B.C.), and was succeeded by his son A. II. This A. is mentioned in the book of Daniel (xi. 6) as the king of the north—the king of the south being Ptolemy, whose daughter, Berenice, A. had been compelled to marry. On the death of Ptolemy, A. recalled his former wife, Laodice; but she, in revenge for the insult which she had received, caused A. to be murdered, along with Berenice and her son. A. lost the provinces of Parthia and Bactria.

But the most distinguished of the Seleucidæ was A. III., surnamed the Great, who was the son of Seleucus Callinicus, and grandson of the preceding. In his earlier wars with Ptolemy, Philopator A. was generally successful; and though he was defeated in a great battle fought near Gaza, he afterwards, by his victory over the Egyptian general, Scopas, obtained entire possession of Palestine and Cœle-Syria. In this war he was assisted by the Jews, to whom he granted many privileges. Fearing the power of the Romans, A. at length concluded a peace with Egypt, betrothed his daughter Cleopatra to the young king Ptolemy, and gave her Cœle-Syria and Palestine as a dowry. The formidable enemy which he thus hoped to escape encountered him at a later period of his career. Having conquered Philip of Macedonia, the Romans no longer dreaded a war with A., and accordingly sent him an embassy, demanding the surrender of the Thracian Chersonese, and of the places which he had conquered from Ptolemy, whose guardian the Romans had become. In 191 B.C., he was entirely defeated by the consul Acilius Glabrio at Thermopylæ, and compelled to return to Asia. Having a second time tried the fortune of war, he was defeated by Scipio, who had crossed over into Asia, and very severe terms were imposed on him. He found so much difficulty in raising money to pay the tribute the Romans demanded, that he was led to plunder a temple in Elymais, when the people rose against him, and killed him (187 B.C.). The fate of A. was foretold in the book of Daniel (xi. 18, 19).

A. IV. (175–164 B.C.), surnamed Epiphanes, by his tyranny and sacrilege, excited the Jews to a successful insurrection under their leaders Mattathias, Judas Maccabæus, and the other members of that heroic family. The monstrous life of A. is recorded in the books of the Maccabees. The last of the Seleucidæ, A. XIII., surnamed Asiaticus, was deprived of his kingdom by Pompey, who reduced Syria to a Roman province (65 B.C.).

**ANTIOQUIA**, one of the United Colombian states, between 8° 9' and 5° 3' n., and 74° 3' and 76° 13' w.; 22,316 sq.m.; pop. '71, 365,974, of whom about one fifth are white, the remainder being mestizos (or white and Indian mixed), mulattoes, and Indians. The Andes spread over nearly all the state. The Magdalena river forms the eastern boundary, and is navigable for light draft steamers. The river Cauca flows through the state. A. is rich in gold mines, has a fertile soil, and is prolific in cattle. Iodine springs are common, and useful in preventing goitre, which prevails in some of the states. Capital, Medellin.

**ANTIPÆDOBAPTIST**, a term exactly designating one who objects to child-baptism. As such a one, however, is generally known in this country under the name Baptist, see BAPTIST.

**ANTIPAROS** (anciently called Olearos or Oliaros), one of the Cyclades islands, celebrated for a stalactitic cave, is separated from Paros by a narrow strait. It contains about 400 inhabitants, and forms a part of the eparchy of Naxos. A. is 7 m. in length by about 3 in breadth; it is scantily supplied with water, but the flats in the north and west are tolerably fertile. Corn and wine are cultivated, but not to any great extent. The principal occupation of the inhabitants is fishing. From Kastron, the only village in the island, the distance to the celebrated grotto is about an hour and a half's ride. This wonderful cave is not alluded to by any Greek or Roman writer whose works are extant, but must have been visited by the curiosity-hunters of antiquity, for, in 1806, Colonel Leake deciphered a Hellenic inscription which contained the names of those who had descended into it in ancient times. It is situated in the side of a mountain on the s. coast of the island, which is described as a mass of white marble. The top or entrance of the cave has a striking appearance; but the sloping descent is rather dangerous, on account of the cord by which the traveler holds being extremely slippery from constant humidity. The bottom once reached, and the grotto entered, there is presented to the eye as dazzling a specimen of stalactitic formation as can well be conceived—the roof, floor, and walls of the various chambers, all glittering with the most gorgeous incrustation, though it is said that the smoke of the torches and the constant fingering of visitors are sullyng the primitive purity of the massive columns. It is believed that there are other caves of equal splendor in the vicinity which have not yet been discovered. The height of the known cavern is 80 ft.; its length and breadth more than 300; but it seems the eye can only take in at once a length of 150 ft., and a breadth of 100. The grotto was first made known to the modern world in 1673, by the then French ambassador to the porte, M. de Nointel.

**ANTIPAS**. See HEROD ANTIPAS, *ante*.

**ANTIPATER.** Of the many persons who bore this name in antiquity, the most celebrated was one of the generals and confidential friends of king Philip of Macedon. When Alexander led his troops into Asia, he left A.—who, along with Parmenion, had endeavored to dissuade him from the expedition—as governor of Macedonia. A. discharged the duties of this office with great ability, suppressing the insurrections in Thrace and Sparta; but Olympias, the mother of Alexander, who entertained a dislike to A., prevailed on her son to appoint Craterus as regent of Macedonia. Alexander, prompted also, it is supposed, by his own jealousy of A., consented, but died before the change was carried into effect; and A. was left to share with Craterus the government of Alexander's territories in Europe. The government of Macedonia was assigned to him; and soon after he was called upon to defend himself against an alliance of the Grecian states. With the assistance of Craterus—on whom he afterwards bestowed his daughter Phila in marriage—and to a certain extent of Leonnatus, he succeeded in reducing the allies to subjection. Democracy at Athens was abolished, a garrison admitted into Munychia, and the leaders of the popular party put to death. When Demosthenes was summoned to the presence of A., he took poison, which for some time he had been carrying on his person, and died in the temple of Poseidon (322 B.C.). This war was followed by another with Perdiccas, who was also his son-in-law, in which A. was again successful. After the murder of Perdiccas in 321 B.C., A. was appointed to the supreme regency of the kingdom, and the guardianship of Alexander's children. He died at an advanced age, in B.C. 318 or 319, leaving the regency to Polysperchon, to the exclusion of his own son Cassander.

The others of this name were: I. A., second son of Cassander, king of Macedonia, who lived in the 3d c. B.C.—II. A., the father of Herod the Great. He flourished in the days of Pompey and Julius Cæsar, was a firm friend of the Romans, and about the year 47 B.C. was appointed procurator of Judea. He was poisoned in 43 B.C. by one whose life he had twice saved.—III. A., grandson of the former, and son of Herod the Great by his first wife Doris, a worthless prince, who was perpetually conspiring against the life of his brothers, until his trial and condemnation at Jerusalem before Quintilius Varus, the Roman governor of Syria. He was executed in prison five days before Herod died, and in the same year with the massacre of the innocents at Bethlehem.

A. was likewise the name of various eminent men in ancient times—physicians, philosophers, historians, poets, mathematicians, and grammarians.

**ANTIPATHY** is the term applied to a class of cases in which individuals are disagreeably affected by, or violently dislike, things innocuous or agreeable to the majority of mankind. These peculiarities are no doubt sometimes acquired in early life by injudiciously terrifying children with some object, the mental impression becoming permanent. A large class of persons have an A. to animal food, and from childhood refuse to taste it. In others, again, the aversion is limited to one kind of meat, as veal or pork; others are averse to eggs or milk. Nor is this feeling a conscious caprice, which an exertion of the will might remove; for it is generally found that contact with the object of the A. is resented by the bodily economy, and symptoms of poisoning are rapidly produced. Some are affected with these symptoms who have no mental aversion to the article. We read of a countess who had a liking for beef-udder, but directly it touched her lips they became swollen. There is also the case of a boy, who "if at any time he ate of an egg, his lips would swell, in his face would rise purple and black spots, and he would froth at the mouth." Some medicines affect particular persons dangerously, even when given in very minute doses: a single grain of mercury has been known to induce a profuse salivation, with destruction of the jaw-bones. On others, medicines have a peculiar effect—astringents may purge. Every summer, in Great Britain, persons may be seen with the most distressing irritation of the nasal and palpebral mucous membranes, produced by the exhalations arising from the fields during the inflorescence of the hay crop. In others, an asthmatic condition is induced by the same cause. The air of some places has a similar influence on individuals: one gentleman was always attacked with asthma if he slept in the town of Kilkenny, and another rarely escaped a fit of that complaint, if he slept anywhere else.

The most remarkable antipathies are those affecting the special senses. Nearly all persons have a loathing at reptiles, but some few faint on seeing a toad or lizard, others on seeing insects. "The duke d'Epéron swooned at sight of a leveret—a hare did not produce the same effect. Tycho Brahé fainted at sight of a fox, Henry III. of France at that of a cat, and Marshal d'Albert at a pig."—*Müllingen*.

*Hearing* a wet finger drawn on glass, the grinding of knives, or a creaking wheel, is sufficient to produce fainting in some. *Smelling* musk or ambergris throws some into convulsions; and we have seen how articles of food affect others—often, no doubt, owing to perverted taste. The *touch* of anything unusually smooth has the same effect sometimes. Zimmerman records the case of a lady who was thus affected by the feeling of silk, satin, or the velvety skin of a peach.—This subject is also noticed under **INTROSYNCRASY**.

**ANTIPHLOGISTIC** (Gr. *anti*, against, and *phlego*, I burn), a term applied to remedies, and also to regimen, that are opposed to inflammation; such as blood-letting, purgatives, low diet, etc.

**ANTIPHON**, the earliest of the 10 Attic orators in the Alexandrine canon, was the son of Sophilus the Sophist, and b. at Rhamnus in Attica 480 B.C. In his youth, the reputation of Gorgias, the most showy and insincere of all the Greek rhetoricians, was at its height. A. soon became convinced of the worthlessness of that oratory which the fashion of the time so highly valued, and resolved to introduce a new and better kind. He labored to make his arguments clear, solid, and convincing, so that it might be impossible for the judges who listened to the speeches he wrote to refuse their assent to his propositions. His success was unmistakable. Although he never made a public appearance as a pleader in the courts of justice, but contented himself with writing speeches for others to deliver, he acquired great influence, which he did not fail to exert for the furtherance of his political principles. To him must be attributed the overthrow of the Athenian democracy (411 B.C.), and the establishment of the oligarchical government of the Four Hundred; for although Pisander figured prominently before the people in this revolution, the whole affair, according to Thucydides—one of A.'s pupils in oratory, and a man admirably fitted to judge of such a point—was secretly planned by him. The oligarchical government did not prosper. Dissensions quickly broke out among the Four Hundred, and six months after, Alcibiades, the brilliant demagogue, was recalled. A. was brought to trial for treason, in having attempted to negotiate peace with Sparta. He is said to have made a noble defence of himself. Thucydides affirms that an abler was never made by any man in a similar position. It was his first and last oration. He was condemned to death; his property was confiscated, his house razed to the ground, his remains forbidden interment in Attica, and his children forever declared incapable of enjoying civic privileges. Of the 60 orations of A. which the ancients possessed, only 15 have come down to us. Three of these are written for others, and are greatly admired for their clearness, purity, and vigor of expression; the remaining 12 appear to have been intended as specimens of school-rhetoric for his pupils. They are not held in equal estimation with the others.

**ANTIPH'ONY**, a name given by the ancient Greeks to a species of musical accompaniment in the octave, by instruments or voices, in opposition to that executed in unison, which they called *homophony*. A. is also the name of a species of sacred song, sung by two parties, each responding to the other; a practice which was cultivated in the early ages of the Hebrews, Greeks, and Romans. Many of the psalms of David show that antiphonal singing was then in use. Its introduction into the Greek church is ascribed to Ignatius, bishop of Antioch, in the 2d c.; and Ambrosius, bishop of Milan, is said to have introduced it into the western church, in the 4th c. The dividing of the antiphonies into verses, with rules regarding the same, is attributed to pope Celestin in 432. pope Gregory I., in 590, prepared the first regular *antiphonarium* (see *Durandi Rationale Divinorum Officiorum*, Mainz, 1469). It was early a custom, which became especially common after the 13th c., to date deeds with the beginning words of the A. (*Introitus*), which in these times served for the day of the month and of the week. The reformed Christian churches of Germany and England have still retained a certain degree of antiphonal singing. The chanting of the psalms in the English cathedral service is an imitation of the ancient antiphony.

**ANTIP'ODES**, a word of Greek origin, signifying, literally, those who have their feet over against each other. As applied to geography, the term means the inhabitants of any two opposite points of the globe, or, in other words, the dwellers at the opposite extremities of any diameter of the earth. From this primary relation, there necessarily arise many secondary relations. A. must be on one and the same meridional circle, separated from each other by half the circumference. Being on one and the same meridional circle, they must differ in long. exactly  $180^\circ$ , with the exception of the poles themselves, as having no longitude at all; and being separated from each other by half the circumference, they must be equidistant from the equator in opposite directions. Take Edinburgh, as an example, in lat.  $55^\circ 57' \text{ n.}$ , and long.  $3^\circ 11' \text{ w.}$ ; its A. must be in lat.  $55^\circ 57' \text{ s.}$ , and in long.  $183^\circ 11' \text{ w.}$ , or rather in  $176^\circ 49' \text{ e.}$ —which is merely an undistinguishable spot in the Antarctic or Southern ocean. Take, as another example, London, in lat.  $51^\circ 30' \text{ n.}$ , and long.  $0^\circ 5' \text{ w.}$  Its A. must be in lat.  $51^\circ 30' \text{ s.}$ , and in long.  $180^\circ 5' \text{ w.}$ , or rather  $179^\circ 55' \text{ e.}$ —coinciding pretty nearly with a small island to the s.e. of New Zealand. This small island, in honor rather of London than of itself, has appropriated the term A. as its own peculiar name.

Between A. in general there necessarily exist also other secondary relations. With reference to the earth's daily rotation, the noon of the one side must be the midnight of the other; while, with regard to its annual revolution, the summer and the autumn of the one side must be the winter and the spring of the other. With respect, however, to the former contrast, some explanation may be required. This, for instance, being Wednesday in London, was last midnight in that city the noon of Tuesday or of Wednesday at A. island? The answer is, that according to circumstances, it may be held to be either the one or the other. In going eastward—that is, in meeting the sun—one, from day to day, anticipates every noon and every midnight in the proportion of 4' of time to  $1^\circ$  of long., or of 12 hours of time to  $180^\circ$  of long.; so that, on reaching A. island from London by the cape of Good Hope, the middle of Tuesday night, by Greenwich reckoning, is actually regarded on the spot as the noon of Wednesday. In going west-

ward, again—that is, in leading, as it were, the sun—one, from day to day, postpones every noon and every midnight in the same proportion as above; so that, on reaching A. island from London by cape Horn, the middle of Tuesday night, by Greenwich reckoning, is actually regarded on the spot as the noon of Tuesday. In fact, navigators in opposite directions, meeting at any intermediate point whatever of the earth's circumference, always differ in their computation of time by a whole day, or 24 hours. In two cases, this has been permanently exemplified: the Spaniards at the Philippines, who have come from the e., are a day behind the Portuguese in Macao, who have come from the w.; while on the n.w. coast of America, the Russians from the w. were a day in advance of the British from the e.

**ANTIPOPE** was a pontiff elected in opposition to one canonically chosen. The first antipope is reputed to be Laurentius, elected 398, in opposition to Symmachus. Several emperors of Germany set up popes against those whom the Romans had elected without consulting them. Otho the great displaced successively two bishops of Rome; and when Sylvester, III. had expelled the simoniacal and profligate pope Benedict IX., Conrad II., king of Germany, brought back this worthless pastor, who hastened to sell his dignity to Gregory VI. There were now, consequently, three popes, and their number was increased to four by the election of Clement II. in 1046. Shortly after, Alexander II. found a rival in Honorius II.; and in 1080 the same unseemly spectacle was witnessed, when Henry IV., emperor of Germany, elevated to the papal chair Guibert of Ravenna, under the title of Clement III., in opposition to his implacable adversary, Gregory VII. But after the death of Gregory, Clement was himself opposed successively by Victor III. and Urban II., and at last died at a distance from Rome, having just beheld the exaltation of Pascal II., as the successor of Urban. During the 12th c., several antipopes flourished, such as Gregory VIII. and Honorius III. On the death of the latter, France began to intermeddle in these disgraceful strifes, and upheld the cause of Innocent II. against Anaclet; while the kings of Sicily, on the other hand, more than once set up a pontiff of their own against the choice of the emperors. Between 1159 and 1878, there were four antipopes; but the most remarkable epoch is “the great schism of the west,” produced by these disedifying rivalries in 1378—a schism which divided the church for 50 years. It broke out after the death of Gregory XI., at the election of Urban VI., whom the voice of the Roman people, demanding an Italian pope, and not one who should fix his pontificate, like several of his predecessors at a distance from Rome, had elevated to the papal throne. The French cardinals objected, withdrew to Provence, and elected a new pope, under the name of Clement VII., who was recognized by France, Spain, Savoy, and Scotland; whilst Italy, Germany, England, and the whole north of Europe, supported Urban VI. These two popes excommunicated each other; nor did they even fear to compromise their sacred character by the most cruel outrages and the most odious insults. The schism continued after their death, when three popes were elected by different parties, all of whom were deposed by the council of Constance, in 1415, and cardinal Colonna elected in their room, under the title of Martin V. The last antipope was Clement VIII. With him the schism ceased. These divisions are often alleged as an argument against the doctrine of papal infallibility; but Catholics consistently affirm that the privilege of infallibility is only claimed in matters of doctrine, and has no relation to questions of fact, such as disputed succession, or canonicity of election. See POPE.

**ANTIQUARIES, SOCIETY OF.** Under this name, associations of learned men, established for the exclusive purpose of cultivating the study of antiquities, exist in the principal countries of Europe and in America—at London, Edinburgh, Paris, Rome, Vienna, Copenhagen, etc. The London society of A. received its charter in 1751, but had commenced its meetings as early as 1707; minutes began to be kept in 1718. Long previous to this, in 1572, an antiquarian society was established by archbishop Parker and Sir Robert Cotton. It was dissolved about 1604 by king James, who regarded the inquiries of the A. with suspicion. The present “society of A. of London” consists of a president, a council of 21, and several hundred fellows. It has published a number of valuable works, among the most interesting of which is a series of Anglo-Saxon and early English literary remains. The Scottish society of A. was founded in 1780. It has published several volumes of transactions and proceedings, with numerous cartularies, besides having collected a valuable museum, which has now become national property, and is arranged for permanent exhibition at the expense of the government. The *Société des Antiquaires de France* took that name in 1814, having been founded in 1805 as the *Académie Celtique*. With the change of name, the sphere of the society's labors was greatly enlarged. It has published many important works. A similar institution is the *Société des Antiquaires de Normandie*, founded at Caen in 1824. The Copenhagen society of A. is a body of high reputation. See ARCHÆOLOGY.

**ANTIQUE.** As the term ancients is commonly applied to the Greeks and Romans, the word A. is used with reference to their works of art, especially their incomparable sculptures. The A. style in works of art is distinguished by critics from the romantic or mediæval, and also from the modern. The sculpture of the Greeks is characterized by freshness, originality, and ideality; and the phases it underwent have their parallels in the development of the literature and general culture of that people. In the earliest

times the statues had a rigid, formal character, and looked more like the idols of barbarous nations than deities in human form; then came stern, Titan-like forms, corresponding with the Prometheus of Æschylus; next the sculptures of Phidias, Polycletes, and Polygnotus—like the characters in the dramas of Sophocles—present to us humanity in its purest and noblest ideal forms. Then, as Euripides in poetry left the old domain of destiny, and derived motives and action from ordinary human passions, so statuary descended from the ideal to a closer resemblance to the forms of actual life; as we see in the works of Praxiteles and Lysippus. Afterwards, when Aristophanes introduced comedy, forms of every-day life began to appear in sculpture; and thus a gradual transition was made from the art of the Greeks, which was ideal, in the true sense of the word, to that of the Romans, which was real, monumental, and portrait-like. The Romans were the realists of the ancient world; their indigenous philosophy was of a popular kind; their poetry, so far as it was national, was satire; and their works of art may be regarded as monuments and portraiture of real life, quite suitable for a nation of soldiers, lawyers, and politicians, but vastly inferior to the ideal beauty displayed in the best period of Grecian art.

#### ANTIQUITIES. See ARCHÆOLOGY.

ANTI-RENTERS, a political party, which, in the four years between 1843 and 1847, made much commotion in that part of the state of New York comprised in the counties of Albany, Columbia, Delaware, Greene, and Rensselaer. In these counties land had been royally granted in the old colonial times to "lords of the manor," who were usually called "patroons." The tracts of land so granted were enormous in extent, and they had made leases in perpetuity, with the ground-rent payable generally in "kind," in corn, grain, skins of animals, and products of the soil or chase. As civilization extended and population increased, such a possession of their lands by tenants in this nature of feudal possession grew irksome to them. While nominally owning their farms they were not the real owners. From complaining, the tenants turned to resisting, and especially upon farms which were handed down through families from generation to generation, until finally the tenants in those counties which have been named banded themselves in associations, in order to attempt to break their leases. Their appeals to the law courts were, however, ineffectual. Then the question entered into the domain of politics, as it has similarly entered in Ireland and England. Great meetings were held in these counties. Agitators who had no particular interest in the anti-rent questions, as well as tenants who had the greatest interest, organized and addressed these meetings, at which there was more or less "sedition" and much rash talking, perhaps natural under the circumstances. Sometimes tenants would refuse to pay even a nominal rent or to recognize the "landlordism" in their cases, and then, of course, resort would be had to the courts for eviction procedures, to which there would be resistance. From legal resistance the tenants went on to armed and belligerent resistance. They would dress like Indians and disguise their faces with paints, and then seize the deputy-sheriffs, who came to serve process of eviction, and tar and feather them. In one or two instances extreme violence was resorted to, and all this resistance led to the passage of a statute against men appearing in public in disguise.

During the summer of 1845 some alarming outrages were committed by "Indians" of the anti-rent associations in Columbia county, and the law to prevent people appearing disguised and armed did not have the effect to prevent the outrages. A deputy-sheriff was shot at and wounded. Dr. Boughton, one of the most active agents in exciting these disturbances, was arrested and brought to trial, but the jury would not agree to convict him. On a second trial, however, Boughton, or "Big Thunder," was convicted and sentenced to the state prison. In Delaware and Schoharie counties frequent riots occurred, and finally, Aug. 7, Mr. Steel, a deputy-sheriff, while engaged in the discharge of his official duties, was attacked by an armed party and murdered in the open daylight. Then martial law was proclaimed in the district; several persons were convicted and sent to the state prison, and two were sentenced to be hanged. The death penalty was afterwards commuted by governor Wright for confinement in the state prison for life, and eventually, when the troubles were all ended, they were released. It was two or more years later before the disturbances were suppressed; and, when order was restored, gov. Wright recommended for the relief of the tenantry: 1, that distress for rent accruing on all leases executed in future shall be abolished; 2, taxing the landlord for his income by means of rent; 3, that the duration of the time of all leases to be executed should be restricted to 5 or 10 years. Soon afterwards the legislature acted upon the first of these recommendations; the landlords entered more or less into compositions, and the constitution of 1846 forbade agricultural leases in which were reserved rent or service of any kind during a longer term than 12 years. The A.-R. quickly merged into the great political parties of the period.

#### ANTIRRHINUM. See SNAPDRAGON.

ANTI-SABBATARIANS, those who recognize no obligations to observe either the Jewish Sabbath, or the Christian Lord's day, deeming one day as sacred as another.

**ANTISANA**, a volcanic peak of the Andes, in Ecuador, 35 m. s.e. from Quito; 19,279 ft. high. There have been no eruptions for many years. On the side of A. is lake Mica, near which is a hamlet, which is one of the highest inhabited places on the earth, variously reckoned at 13,300 to 13,465 ft. above sea-level.

**ANTISCORBUTICS.** See SCURVY.

**ANTISEPTICS** are substances which arrest the putrefactive changes that dead vegetable and animal matter is liable to undergo when exposed to air, warmth, and moisture. A. are therefore anti-putrescents; and the term itself indicates the office which the members of the class fulfill (*anti*, against, and *septicus*, putrefactive). The theory of the action of all A. is, that one or two of the three indispensable conditions of putrefaction—viz., 1, a moderate *warmth*, 2, access to air, and 3, moisture—are arrested or neutralized. Thus, in the preservation of fish in stores or during transport by railway, they are packed in barrels with ice, which keeps down the temperature; and though air and moisture gain admittance, yet the putrefactive processes cannot proceed. The same preservative power of cold is observed naturally in the discovery of remains of elephants and other animals imbedded in the ice of the polar regions, and which doubtless have been locked up there for ages. In a less degree, the influence of cold as an antiseptic is observed in the longer time that meat, eggs, and other animal matters keep fresh in winter than in summer.

Again, warmth and moisture may be present, but if the air be excluded, putrefaction does not go on. The ordinary mode of preparing *preserved meats* affords the best illustration of this point. The substance to be preserved is placed in a tin dish covered over, and leaving a very small opening. When the can with its contents is heated, the air which fills up the pores of the solids, and is dissolved in the liquids, is driven off, and escaping by the aperture in the cover of the dish, leaves the contents devoid of air. If the opening be now closed with solder, the air is kept from returning; and whatever climate the can of preserved meat be sent to, yet so long as the tin casing remains good, and refuses to admit the air, so long will the contents continue wholesome and palatable. The common plan of preserving eggs by rubbing over the shell with tallow or oil, is founded on the principle of filling up the pores of the shell, so as to deny the admission of the air. Moisture is likewise necessary for the process of putrefaction. Thus, if the contents of an egg be thrown out on a plate, and thoroughly dried in an oven, the whole becomes of a hard, horny consistence, and may be kept in this state for years without exhibiting the slightest symptom of passing into a putrescent or rotten condition. In the same way meat may be kept quite fresh by depriving it of moisture. Eggs dried up in this manner require only to be soaked in cold water, and then boiled, when they will present themselves in a condition hardly differing in flavor and taste from an ordinary boiled egg.

The more important chemical A. are—alcohol, wood-spirit, creosote, pitch-oil, coke-oil, sugar, tannic acid, sulphurous acid, common salt, nitre, alum, chloride of zinc, sulphate of copper (blue vitriol), corrosive sublimate, arsenic.

The manner in which these A. act is very different.—1. Sulphurous acid acts by combining with the oxygen, and thereby deoxidizing the substance. 2. Sirup of sugar acts by combining with the water of the substance to be preserved. 3. Creosote, tannic acid, alum, chloride of zinc, sulphate of copper, corrosive sublimate, and arsenic, are useful in forming compounds with the organic matter, which are not so liable to become putrescent as the uncombined organic substance. 4. Alcohol, wood-spirit, common salt and nitre, act in a double way, by combining with the water of the putrescible substance, and by combining with the substance itself, so as to form a more durable compound.

Some of the more important uses to which the chemical A. are applied are—1. In the preservation of anatomical specimens, where alcohol, and less often, chloride of zinc, are the agents; 2. In the curing of herring and other fish, where common salt is generally used; 3. In preparing corned or salted meat and tongues, where common salt and nitre are jointly employed; and, 4. In the manufacture of size for writing-papers, where the paper-maker uses sulphite of soda or antichlore (containing sulphurous acid) to arrest the decomposition of the scraps of hides used in the manufacture of size. In the preservation of timber, A. are also taken advantage of. The wood is placed in a steam-box, and the air contained in its pores being replaced by steam, the whole casing is closed tight, and allowed to cool, when the steam condenses, and leaves a vacuum in and around the block of wood. On the introduction thereafter of one of the A., it finds its way into the innermost pores of the timber. Wood thus prepared is less liable to decay than ordinary; and the A. seem not only to withdraw water, and form durable compounds, but to offer a poisonous dose to minute plants and animals which house themselves in the wood. The use of sulphate of copper for this purpose was suggested by Bonchardat; of corrosive sublimate, by Kyan (hence the process was called *kyanizing*); and of chloride of zinc, by Sir W. Burnett (hence the term *burnettizing*). See also CARBOLIC ACID, and Condy's fluid under MANGANESE.

**ANTI-SLAVERY SOCIETY, THE AMERICAN**, organized in Philadelphia, Dec., 1833, by delegates from the few state or city societies in the United States. The first A. S. was formally organized in Boston, Jan. 6, 1832, William Lloyd Garrison being the

leader of the movement. The American A. S. took the boldest ground in favor of the abolition of slavery, and its work was for many years looked upon as fanatical, or at least hopelessly impracticable. The presidents were Arthur Tappan, Lindley Coates, William Lloyd Garrison, and Wendell Phillips, and among its minor officers and most active friends were Beriah Green, John G. Whittier, Oliver Johnson, Lucretia Mott, Abby Kelley Foster, Gerrit Smith, Charles C. Burleigh, Samuel J. May, Francis Jackson, and William Jay. For many years the members of the society were denounced by almost every press in the country; their meetings were broken up by violence, and rewards were offered, in the south, for the assassination of their leaders. But the A. S. was both zealous and persistent, and many of its earliest members lived to find in the adoption of the 13th amendment to the national constitution, a proper time for its formal disbandment, which took place April 9, 1870.

**ANTISPASMODICS.** See SPASM.

**ANTISTHENES**, founder of the Cynic school of philosophy, was the son of A., an Athenian. The date of his birth is not known, but he fought in his youth at Tanagra (426 B.C.), and he survived the battle of Leuctra (371 B.C.), and died at Athens at the age of 70. After listening to the teaching of Socrates, he gave up the profession of rhetoric, which he had followed at first as a disciple of Gorgias, in order to apply himself wholly to the study of moral philosophy. He was present at the death of Socrates, and never forgave his persecutors. A. held that virtue mainly consists in voluntary abstinence from pleasure, and in a stern contempt of riches, honors, and even learning. Opinions of still greater extravagance are ascribed to A., but it is probable that they were rather extreme views, which he put into the mouths of the interlocutors in his dialogues, than expressions of those which he himself entertained. Even in his condemnation of pleasure, he excepted such as springs from the soul, or is founded on true friendship. In consistency with his teaching, A. appeared as a beggar, clad in ragged garments—an eccentricity which Socrates is said to have reproved by saying, "I see your pride through the holes in your cloak." The singularity affected by A. gained many imitators, and among them Diogenes, who chose to live in a tub, and surpassed the master himself in cynic practice. After the death of Socrates, A. taught moral and practical philosophy in the Athenian gymnasium Cynosarges, from which, it is said, his school derived its title. His writings—among them a polemical work against Plato—have mostly perished. Such fragments as remain have been collected by Winckelmann (*A. fragmenta*, Turici, 1842). Ritter classes A. with the "imperfect Socraticists."

**ANTISTROPHE**, a stanza or portion of a poem following the strophe, and responding to it. Or when the same word or phrase is used both at the beginning and end of a clause or sentence; as,

"Fare thee well; and if forever,  
Still forever fare thee well."

In the Greek drama the A. is an important part of the chorus.

**ANTI-TAURUS**, a mountain range in Asia Minor, extending eastward from the Bosphorus, nearly parallel to the Black Sea. The name implies "over against the Taurus," the latter extending along the coast of the Mediterranean.

**ANTITHESIS** (*tithēmi*, to place, *anti*, against), a figure of speech in which words are placed in direct opposition to each other, to produce a strong contrast. Thus Lessing, in criticism on a book, says: "It contains many good things, and many new; but the good are not new, and the new are not good." A. when naturally and moderately employed, gives liveliness to style; but, like all strong figures of speech, becomes wearisome when too often repeated.

**ANTITRINITARIAN**, one who denies the doctrine of the Trinity. An A. differs from a Unitarian only in this respect, that his objection to the doctrine in question is made on philosophical, while that of the latter is made on theological grounds. A Unitarian is one who accepts the Bible as inspired, but does not find in it the doctrine of the Trinity; an A. is, or may be, a philosophical theist, who denies the inspiration of scripture. Mohammed, from the stand-point of a new and hostile religion, also denied this great Christian dogma. He announced himself, with fierce emphasis, an A.; and his followers to the present day are characterized by the intensity of their monotheism. See UNITARIAN and SOCINIAN.

**ANTITYPE**, a Greek word, literally signifying a type or figure which corresponds to some other type or figure. In its theological sense, it denotes, not a type, but the person in whom any prophetic type is fulfilled; thus, Christ is called the A. of the paschal lamb. See TYPE.

**ANTIUM**, one of the most ancient cities of Latium, stood on the coast 34 m. s.e. from Rome. Being favorably situated for commerce and piracy, it became, under the Volscians, into whose hands it had fallen, one of the most powerful enemies of rising Rome, until finally subdued (388 B.C.). It became a favorite resort of the wealthy Romans, and some of the most famous remains of ancient art have been discovered among the ruins of their villas and palaces; such as the Apollo Belvedere, and the Borghese Gladiator. It was the birthplace of the emperors Caligula and Nero; and the latter

constructed a splendid port by means of two moles inclosing a basin 2 m. in circumference. Remains of the moles still exist, although the basin is mostly filled up with sand.

Antium was completely destroyed by the Saracens during the middle ages; and it was only in the 17th c., when the port was very partially restored, that the modern village of Porto d'Anzo arose, the pop. of which does not exceed 500. Near the village Nettuno, in the neighborhood, the ruins of a temple of Neptune are discernible under the sea.

**ANT-LION**, the larva of an insect (*myrmeleon formicarium*) of the order neuroptera, remarkable for its habits, which have been carefully observed by some of the ablest naturalists of Europe. It inhabits sandy districts, is not known in Britain, and is more common in the south of Europe than in the north. The perfect insect is about an inch long, and has a considerable general resemblance to a dragon-fly. The larva is rather more than half an inch long; it has a very large abdomen, and a small head, which, however, is furnished with two very large incurved mandibles. It has six legs, but is incapable of rapid locomotion, and generally moves backwards. It feeds upon the juices of insects, particularly of ants, in order to obtain which it excavates with the greatest ingenuity a funnel-shaped hole in sandy ground, and lies in wait at the bottom, all but its mandibles buried in the sand. Insects which approach too near to the edge of the hole then become its prey, by the loose sand giving way, so that they fall down the steep slope. If they do not fall quite to the bottom, but begin to scramble up again, the A. throws sand upon them by jerking its head, and so brings them back. It employs its head in the same way to eject their bodies from its pit, after their juices have been sucked, and casts them to a considerable distance; and by the same means throws away the sand in excavating its hole, first plowing it up with its body, and then placing it upon its head by means of one of its fore-legs. It always begins by working round the circular circumference of its future hole, and gradually narrows and deepens it; turning quite round after each time that it works round the hole, so as to employ next time the fore-leg of the other side. When it meets with a stone which it cannot remove, it deserts the excavation, and begins another. The pit, when completed, is usually about 30 in. in diameter by 20 in depth.

**ANTOINE DE BOURBON**, Duke of Vendôme, who married in 1548 Jeanne d'Albret, only child of Henry II. of Navarre, by whom he was the father of Henry IV.

**ANTOMMAR'CHI**, FRANCESCO, a well-known physician and native of Corsica, was born in the second half of the 18th century. He owes his celebrity almost entirely to his intimacy with Napoleon Bonaparte during the exile of the latter in St. Helena. In 1818, he was induced to leave Florence, where he held the office of anatomical dissector in the hospital of Santa Maria Nuova of Florence, and to become private physician to the banished emperor. There was at first little cordiality between the two; but subsequently Bonaparte conceived a high regard for his countryman, and at his death left him 100,000 francs. In 1821, A. returned to Europe, and in 1826 published at Paris *Les Derniers Moments de Napoleon*, a work which has been very extensively read. He now became involved in a dispute with the heirs of Mascagni—his old anatomical professor—regarding certain anatomical plates which he announced as on the eve of publication. The heirs affirmed that A.'s lithographed drawings were mere copies from the plates of Mascagni, and the controversy went on briskly for some time, till Paris grew tired of it, when it gradually died away and was forgotten. On the breaking out of the Polish revolution, A. departed for Warsaw, where he received the appointment of general inspector of military hospitals. He soon returned to Paris, where he published a cast of Napoleon's head, which he affirmed to have taken when the emperor was on his death-bed. This declaration again involved him in a hot dispute with the phrenologists, who were not satisfied with the conformation of the cranium, and therefore cast suspicions—some of them apparently not altogether ill founded—on the veracity of A.'s statements. Harassed by the attacks of his adversaries, and sick of further controversy, A., about 1836, resolved to emigrate to America. He d. at San Antonio, in Cuba, on the 3d of April 1838.

**ANTONEL'LI**, GIACOMO, a distinguished cardinal, was b. on the 2d of April, 1806, at Sonnino, a village situated near the Pontine marshes. His father, a wood-cutter, sent A. to be educated at the grand seminary of Rome, where he proved himself one of the cleverest students of his time. He gained the favor of the late pope Gregory XVI., who named him a *prelato*, and gave him some excellent ecclesiastical appointments. In 1841, A. became under-secretary of state to the ministry of the interior; in 1844, second treasurer; and in the following year, finance minister of the two apostolic chambers. Pope Pius IX. having mounted the papal throne in 1846, raised A., during the next year, to the dignity of cardinal-deacon of St. Agatha alla Suburra. In 1848, A. was president and minister of foreign affairs in a liberal cabinet, which framed the famous *statuto* or constitution, proclaimed in 1848, the principal articles of which were so very soon eluded. In the oecumenical council, which began its sittings in 1869, A. showed great tact and ability in restraining the zeal and impetuosity of his impulsive master. He d. in 1876.

**ANTONELLO**, of Messina, a painter who holds a prominent position in the history of Italian art, was b. probably about 1414, in Sicily. In his day, the paintings of

Johann van Eyck, of Flanders enjoyed a wide celebrity, and several specimens were brought to Naples, where A. saw one of them. Admiring the new style of oil-painting, he traveled into Flanders, and learned the secrets of the art from Van Eyck. Afterwards, he settled in Venice, and was the first Italian who painted in oil-colors, in which he gave instruction to many artists. He d. probably in 1498. His works are now rather scarce. One, in the museum at Berlin, bears the date 1445.

ANTONIDES, HANS (Jan Van der Goes), 1647-84; a Dutch poet. He was of humble origin, educated at the expense of one of the lords of the admiralty at Amsterdam, and received the degree of doctor of physic. He is best known by his poems and a tragedy written at the age of 19, called *Trazil, or the Conquest of China*. His fame was fully established by *Y-Stroom*, an epic on the river Y.

ANTONINUS, MARCUS AURELIUS, the son of Annius Verus and Domitia Calvilla, was b. at Rome on the 20th of April, 121, A.D. His original name was Marcus Annius Verus. On the death of his father, he was adopted by his grandfather, who spared no pains to render him pre-eminent in every art and science. His fine qualities early attracted the notice of the emperor Hadrian, who used to term him not *Verus*, but *Verissimus*, and who conferred high honors on him, even while a child. When only 17 years of age, he was adopted, along with Lucius C. Commodus, by Antoninus Pius, the successor of Hadrian; and Faustina, the daughter of Pius, was selected for his wife. In the year 140 A.D., he was made consul; and from this period to the death of Pius, in 161 A.D., he continued to discharge the duties of his various offices with the greatest promptitude and fidelity. The relation which subsisted between him and the emperor was of the warmest and most familiar kind. On his accession to the throne, he strikingly illustrated the magnanimity of his character, by voluntarily sharing the government (which Pius had left in his last moments, and the senate offered to him *alone*) with young Commodus, who henceforth bore the name of Lucius Aurelius Verus, and to whom he gave his daughter Lucilla in marriage. Towards the close of 161 A.D., the Parthian war broke out, and Lucius, a young man of vigorous bodily habits, was sent to the frontiers of the empire, to repel the incursions of the barbarians; but intoxicated with the enervating pleasures of the east, he obstinately refused to go beyond Antioch, and intrusted the command of the army to his lieutenant Cassius, who gained several brilliant victories. Lucius returned to Rome (166 A.D.), and enjoyed a triumph to which he had no real claim; for all the great achievements of the war were accomplished by his officers, while he was reveling in the most extravagant licentiousness. In the meantime, Marcus Aurelius had distinguished himself by the prudence and energy with which he administered affairs at home. A formidable insurrection had long been preparing in the German provinces; the Britons were on the point of revolt, and the Catti waiting for an opportunity to devastate the Rhenish provinces. Within Rome itself raged a pestilence, believed to have been brought home by the troops of Lucius; frightful inundations and earthquakes had laid large portions of the city in ruins, destroyed the granaries in which were kept the supplies of corn, and thus created almost universal distress, which stimulated to an incalculable degree the terror which the citizens entertained of their savage enemies. To allay the popular perturbation, Marcus resolved to go forth to the war himself. Hecatombs were offered to the offended gods, and the Roman legions set out for the north. Marcus and Lucius were, for the time, completely successful. The pride of the Marcomanni, and the other rebellious tribes inhabiting the country between Illyria and the sources of the Danube, was humbled, and they were compelled to sue for peace in 168 A.D.; in the year after which Lucius died. The contest was renewed in 170 A.D., and may be said to have continued with intermission during the whole life of the emperor. Although fond of peace, both from natural disposition and philosophic culture, he displayed the sternest vigor in suppressing the revolts of the barbarians; but in order to accomplish this, he had to enroll amongst his soldiery vast numbers of gladiators and slaves, for his army had been thinned by the ravages of the plague. His head-quarters were Pannonia, out of which he drove the Marcomanni, whom he subsequently all but annihilated in crossing the Danube. The same that befell the Jazyges; but the most famous as well as the most extraordinary of all his victories was the miraculous one gained over the Quadi (174 A.D.), and which gave rise to copious discussion amongst Christian historians and others. Don Cassius's account is that the Romans were perishing of thirst in the heat of summer, when suddenly the cloudless sky darkened, and abundant showers fell, of which the soldiers were taking advantage when the barbarians attacked, and would have cut them to pieces, if a storm of hail and fire had not descended on the former. That some extraordinary phenomenon occurred is evident, for there is a letter of Aurelius still extant in which he commemorates the event; and the emperor was a man incapable of uttering a falsehood, not to mention that there was an entire army living to disprove the statement, if untrue. The effect of this remarkable victory was instantaneously and widely felt. The Germanic tribes hurried from all quarters to make their submission, and obtain clemency; but the practical advantages that might have resulted from it were nullified by a new outbreak in the east, occasioned through the infamous treachery of his own wife, which demanded his presence; and though suffering from failing health, he was obliged to leave Pannonia. Before his departure, however, he learned that the ambitious governor, Avidius Cassius, who had rebelled against him, and seized the whole of

Asia Minor, had perished by assassination. The conduct of Marcus Aurelius on hearing of his enemy's death was worthy of the sublime virtue of his character. He lamented that the fates had not granted him his fondest wish—to have freely pardoned the man who had so basely conspired against his happiness. Like Cæsar in similar circumstances, but in a more purely humane spirit, he received the head of his murdered adversary with quite opposite feelings to what had been anticipated, rejecting the bloody gift with all the loathing of a benevolent nature, and even shrinking from the presence of the murderers. On his arrival in the east, he exhibited the same illustrious magnanimity. He burned the papers of Cassius, without reading them, so that he might not be at liberty to suspect any as traitors; treated the provinces which had rebelled with extreme gentleness; disarmed the enmity and dispelled the fears of the nobles who had openly favored his insurgent lieutenant. While pursuing his work of restoring tranquillity, Faustina died in an obscure village at the foot of Mt. Taurus; and her husband (and this was perhaps the single frailty of his character), though undoubtedly conscious of her glaring profligacy and infidelity, paid the most lavish honors to her memory.

On his way home, he visited lower Egypt and Greece, displaying everywhere the noblest solicitude for the welfare of his vast empire, and drawing forth from his subjects, who were astonished at his goodness, sentiments of the profoundest admiration and regard. At Athens, which this imperial pagan philosopher must have venerated as a pious Jew did the city of Jerusalem, he showed a catholicity of intellect worthy of his great heart, by founding chairs of philosophy for each of the four chief sects—Platonic, Stoic, Peripatetic, and Epicurean. No man ever labored more earnestly to make that heathen faith which he loved so well, and that heathen philosophy which he believed in so truly, a vital and dominant reality. Towards the close of the year 176 A.D., he reached Italy, and celebrated his merciful and bloodless triumph on the 23d of Dec. In the succeeding autumn, he departed for Germany, where fresh disturbances had broken out among the restless and volatile barbarians. He was again successful in several sanguinary engagements; but his originally weak constitution, shattered by perpetual anxiety and fatigue, at length sunk, and he died either at Vienna or at Sirmium, on the 17th of Mar., 180 A.D., after a reign of twenty years.

Marcus Aurelius A. was the flower of the stoical philosophy. It seems almost inexplicable that so harsh and crabbed a system should have produced as pure and gentle an example of humanity as the records of heathen—we had almost said, Christian history, can show. Perhaps, as a modern philosophic theologian suggests, it was because stoicism was the most solid and practical of the philosophic theories, and the one which most earnestly opposed itself to the rapidly increasing licentiousness of the time, that the chaste heart of the youth was drawn towards it. At twelve years of age, he avowed himself a follower of Zeno, Epictetus, etc. Stoics were his teachers—Diogenes, Apollonius, and Junius Rusticus; and he himself is to be considered one of the most thoughtful teachers of the school. Oratory he studied under Herodes Atticus and Cornelius Fronto. His love of learning was insatiable. Even after he had attained to the highest dignity of the state, he did not disdain to attend the school of Sextus of Chaeronea. Men of letters were his most intimate friends, and received the highest honors both when alive and dead. His range of studies was extensive, embracing morals, metaphysics, mathematics, jurisprudence, music, poetry, and painting. Nor must we forget that these were cultivated not merely in the spring-time of his life, when enthusiasm was strong, and experience had not saddened his thoughts, and when study was his only labor, but during the tumults of perpetual war, and the distraction necessarily arising from the government of so vast an empire. The man who loved peace with his whole soul, died without beholding it, and yet the everlasting presence of war never tempted him to sink into a mere warrior. He maintained uncorrupted to the end of his noble life his philosophic and philanthropic aspirations. After his decease, which was felt to be a national calamity, every Roman citizen, and many others in distant portions of the empire, procured an image or statue of him, which more than a hundred years after was still found among their household gods. He became almost an object of worship, and was believed to appear in dreams, like the saints of subsequent Christian ages.

There is one feature in his character, however, which it would be dishonest to pass over—his hostility, namely, to Christianity. He was a persecutor of the new religion, and, it is clearly demonstrated, was cognizant, to a certain extent at least, of the atrocities perpetrated upon its followers. Numerous explanations have been offered of his conduct in this matter. The most popular one is that he for once allowed himself to be led away by evil counselors; but a deeper reason is to be found in that very earnestness with which he clung to the old heathen faith of his ancestors. He believed it to be true, and to be the parent of those philosophies which had sprung up out of the same soil: he saw that a new religion, the character of which had been assiduously, though perhaps unconsciously, misrepresented to him, both as an immoral superstition and a mysterious political conspiracy, was secretly spreading throughout the empire, and that it would hold no commerce with the older religion, but condemned it, generally in the strongest terms. It was, therefore, comparatively easy, even for so humane a ruler, to imagine it his duty to extirpate this unnaturally hostile sect. Mr. John Stuart Mill finds in this tragical error of the great emperor a most striking warning against the danger of interfering with the liberty of thought. What he says is so completely in harmony with 'he

above conception of the motives of Marcus Aurelius, and is in itself so eloquent, that no apology is required in quoting the passage: "If ever any one possessed of power had grounds for thinking himself the best and most enlightened among his contemporaries, it was the emperor Marcus Aurelius. Absolute monarch of the whole civilized world, he preserved through life not only the most unblemished justice, but, what was less to be expected from his stoical breeding, the tenderest heart. The few failings which are attributed to him were all on the side of indulgence; while his writings, the highest ethical product of the ancient mind, differ scarcely perceptibly, if they differ at all, from the most characteristic teachings of Christ. This man, a better Christian, in all but the dogmatic sense of the word, than almost any of the ostensibly Christian sovereigns who have since reigned, persecuted Christianity. Placed at the summit of all the previous attainments of humanity, with an open, unfettered intellect, and a character which led him, of himself, to embody in his moral writings the Christian ideal, he yet failed to see that Christianity was to be a good and not an evil to the world, with his duties to which he was so deeply penetrated. Existing society he knew to be in a deplorable state. But such as it was, he saw, or thought he saw, that it was held together, and prevented from being worse, by belief and reverence of the received divinities. As a ruler of mankind, he deemed it his duty not to suffer society to fall in pieces, and saw not how, if its existing ties were removed, any others could be formed which could again knit it together. The new religion aimed openly at dissolving these ties: unless, therefore, it was his duty to adopt that religion, it seemed to be his duty to put it down. Inasmuch, then, as the theology of Christianity did not appear to him true, or of divine origin—inasmuch as this strange history of a crucified God was not credible to him, and a system which purported to rest entirely upon a foundation to him so wholly unbelievable could not be foreseen by him, to be that renovating agency which, after all abatements, it has in fact proved to be—the gentlest and most amiable of philosophers and rulers, under a solemn sense of duty, authorized the persecution of Christianity. To my mind, this is one of the most tragical facts in all history. It is a bitter thought, how different a thing the Christianity of the world might have been, if the Christian faith had been adopted as the religion of the empire, under the auspices of Marcus Aurelius, instead of those of Constantine. But it would be equally unjust to him, and false to truth, to deny, that no one plea which can be urged for punishing anti-Christian teaching, was wanting to Marcus Aurelius for punishing, as he did, the propagation of Christianity. No Christian more firmly believes that atheism is false, and tends to the dissolution of society, than Marcus Aurelius believed the same things of Christianity; he who, of all men then living, might have been thought the most capable of appreciating it. Unless any one who approves of punishment for the promulgation of opinions, flatters himself that he is a wiser and better man than Marcus Aurelius—more deeply versed in the wisdom of his time—more elevated in his intellect above it—more earnest in his search for truth, or more single-minded in his devotion to it when found—let him abstain from that assumption of the joint infallibility of himself and the multitude, which the great A. made with so unfortunate a result."

**ANTONINUS PIUS**, **TITUS AURELIUS FULVUS**, a Roman emperor (138-161 A.D.), was b. in the reign of Domitian (86 A.D.). The family of A. was originally from Nemausus, now Nîmes, in Gaul. A. inherited great wealth, and early gave proof of excellent qualities. In 120, he was made consul; afterwards was sent by Hadrian as proconsul into Asia, where the wisdom and gentleness of his rule won for him a higher reputation than had been enjoyed by any of his predecessors. By his wife Faustina he had four children, of whom three died, leaving a daughter, Faustina, afterwards wife of Marcus Aurelius. In 138, he was adopted by the emperor Hadrian, in consequence of merit alone, and came to the throne in the same year. The reign of A. was proverbially peaceful and happy. In his private character, he was simple, temperate, and benevolent; while in public affairs he acted as the father of his people. The persecution of Christians, which was continued during his reign, was partly stayed by his mild measures. He was little engaged in war, excepting in Britain, where he extended the power of Rome, and built a wall between the Forth and the Clyde, as a defense against invasions by the predatory inhabitants of the north; but he was frequently employed in arbitration and general counsel on the affairs of foreign states. "Happy the nation which has no history." The reign of A. illustrates this saying, for by the justice, wisdom, kindness, and courtesy of the emperor, his vast empire was preserved from the crimes, conspiracies, insurrections, and bloodshed, the recording of which formed the largest part of the historian's work in the dark centuries of the Roman empire. It is said that only *one* senator was impeached during A.'s lifetime. Literature received great encouragement; the laws were improved; commerce extended; the means of communication were facilitated by the repair of roads, bridges, etc.; new sanitary regulations were introduced; and a taste for architecture fostered in the citizens. The epithet *Pius* was conferred on him on account of his conduct in defending the memory of his predecessor Hadrian against certain dishonoring measures brought forward by the senate. A. d. in 161 A.D. The column raised to his memory by his adopted son and successor, Marcus Aurelius Antoninus (q.v.), was discovered in 1709, and now exists only in fragments. The so-called pillar of Antoninus, now in the *Piazza Colonna* at Rome, is that raised by the senate in honor of Marcus Aurelius, after his victory over the Marcomanni.

**ANTONINUS, ITINERARY OF**, *Antonini Itinerarium*, a valuable geographical work, containing the names of all the places and stations on the principal and cross roads of the Roman empire, with their distances from each other in Roman miles. It has been usually attributed to the emperor M. Aurelius Antoninus, whence its name. The testimony, however, of the Greek geographer Æthicus, author of the *Cosmographia*, assures us that a general survey of the Roman empire was commenced 44 B.C., in the consulship of Julius Cæsar and M. Antonius, and completed in the reign of Augustus, when the results of the survey received the sanction of the state. These results, it is with some probability inferred, are embodied in this *Itinerary*, which, it is further supposed, received additions and amendments in the time of the Antonines. Subsequent improvements were made down to the reign of Diocletian. The best editions are those of Wesseling (Amst., 4to, 1735) and Parthey (Berl., 1848).

**ANTONINUS, WALL OF**, *Antonini vallum*, a barrier erected between the firths of Forth and Clyde by the Romans, in the reign of Antoninus Pius, to restrain the encroachments of the native tribes. A fragment of a Roman pillar, which was at one time in the university of Edinburgh, fixes the date of its execution to 140 A.D. The superintendence of the work is generally attributed to the imperial legate Lollius Urbicus. Its length was about 27 English m.—the eastern termination being, according to two different suppositions, at Carriden, or at Kinniel, on the Forth; the western, at old Kilpatrick, or at Dunglass castle, on the Clyde. The work consisted of a ditch about 20 ft. deep and 40 wide, a rampart of earth and stone about 20 ft. high and 24 ft. thick at the base, and on the inner or s. side of the rampart a paved military road. It was protected by a chain of nineteen forts, with watch-towers between. The line of the wall may still be traced to a considerable extent. The most perfect fragments are at Elf hill, on the moor of Bonnieside, about a mile and a half from Castlecary; within the park of Callander house, near Falkirk; and on the slopes at Inveravon, not far from the railway station at Polmont. It is commonly designated *Graham's Dike*—a name given also to more than one ancient ditch and rampart in England. See SEVERUS, WALL OF. For best accounts of the wall of Antonine see Roy's *Military Antiquities of the Romans in North Britain* (1793) and Stuart's *Caledonia Romana* (2d ed., 1852).

**ANTONIO, NICOLAS**, 1617–84; a Spanish bibliographer and critic. In 1659, Philip IV. made him his general agent at the court of Rome, where he remained 20 years, and employed most of his time on his great work, which was a complete list of Spanish authors and a catalogue of their writings. He published part of it in 1672 under the title *New Spanish Library*, and in 1696 the *Old Library* appeared. About 1677, he was fiscal for the royal council in Madrid. His *Bibliotheca Hispana* is considered by some critics the best work on Spanish literature. He also wrote a critique on fabulous histories.

**ANTONIUS, MARCUS**, b. 143, killed 87 B.C.; commonly called "the orator;" one of the most eloquent of Roman lawyers and speakers. He was the grandfather of Mark Antony, the triumvir. In 103 he obtained the government of Cilicia, with the title of proprætor, and in 99 became consul. He favored the aristocratic party, and was an adherent of Sulla in the civil war against Marius, by whose order he was assassinated. In the judgment of Cicero, Marcus A. and L. Crassus were the first Roman orators who equaled the great speakers of Greece.

**ANTONIUS, MARCUS (MARK ANTONY)**, the Roman triumvir, b. in 83 B.C., a descendant of one of the oldest patrician families, was the son of the prætor M. Antonius Creticus, and, on the side of his mother Julia, was related to Julius Cæsar. His youth was wasted in dissipation, and finding himself pressed by numerous impatient creditors, he escaped to Greece in 58 B.C., where, for a short time, he listened to the teaching of Athenian philosophers and orators. His studies here were soon interrupted by the proconsul Gabinus, who appointed him as leader of his cavalry. In the campaign against Aristobulus in Palestine, and in Egypt, A. distinguished himself by his courage and activity, and ingratiated himself with the soldiers. After assisting Cæsar in Gaul, he went to Rome in 50 B.C., to advance the interests of the former, who stood in great danger from the hostility of the oligarchical party, and was appointed an augur, and chosen one of the tribunes of the people. In the following year, on account of his adherence to the party of Cæsar, he was expelled from the curia, and fled to Cæsar, who made use of this event as a pretext for his war against Pompey. At the outbreak of this war, A. received the appointment of commander-in-chief in Italy. In the battle of Pharsalia, he commanded the left wing of Cæsar's army. In 47, he was made master of the horse by Cæsar, who left him to govern Italy during his absence in Africa. Antony, as usual, disgraced himself; got perpetually drunk; divorced his wife, and married an actress, with whom he paraded offensively through the chief towns of the peninsula. In 44 B.C., he married Fulvia, the widow of Clodius; was made consul, and vainly endeavored to prevail on the Romans to recognize Cæsar as emperor. After the assassination of Cæsar, he played the part so well described by Shakespeare; and by his funeral oration, and the well-timed display of Cæsar's bloody robe, so wrought on the passions of the people, that the conspirators were compelled to escape from Rome, leaving the successful orator for a while in possession of almost absolute power. Next, we find A. occupied in disputes and reconciliations with Octavianus (Cæsar's heir), besieged

ing Mutina, and then denounced by Cicero as an enemy of the state. In 43 B.C., his troops were defeated at the battle of Mutina, when he escaped beyond the Alps; visited the camp of Lepidus, who commanded in Gaul; and gained the favor of the army, of which he took command. Plancus and Pollio joined him with their troops; and A., who so recently had escaped as a helpless fugitive from Italy, returned to Rome at the head of 17 legions and 10,000 cavalry. Octavianus, who had pretended to maintain republican principles, now threw off the mask, and held a consultation with A. and Lepidus on the island of Reno (or Lavino), near Bologna, when it was determined that these triumviri should share the whole Roman world among themselves. To secure their spoil, they returned to Rome, and began their course of murder and robbery throughout Italy. Among their first victims fell Cicero, the orator, whose eloquence they dreaded. According to Appian, not less than 300 senators and 2000 knights fell under the power of the triumviri. After making Italy safe for themselves, and raising an enormous sum of money to carry on their war abroad, A. and Octavianus led their troops into Macedonia against Brutus and Cassius, and defeated the republican forces. A. next paid a visit to Athens, and then went into Asia, to arrange his dispute with Cleopatra, queen of Egypt, whose conduct had offended the triumviri. The queen herself appeared to answer his challenge, and captivated A. by her beauty and address. The general who had overcome Brutus and Cassius was now made a prisoner, though not of war. He followed Cleopatra into Egypt, and lived with her in idleness and luxury, until he was aroused by tidings of the quarrel which had taken place in Italy between his own relatives and Octavianus. This dispute gave rise to a short war, which came to an end before A. arrived in Italy. A new division of the Roman world now took place between the triumviri, and was soon quietly arranged at Brundisium. A. took the east, and Octavianus took the west; while the ambition of the feeble Lepidus was appeased by his having the whole of Africa for his portion. Even this shadow of dominion was taken from him in 36 B.C. Meanwhile A. had confirmed his friendship with Octavianus by a marriage with Octavia, his sister. He now returned to Cleopatra, resumed his former voluptuous mode of life, squandered the wealth of Rome in gifts to his royal mistress, and became guilty of gross acts of injustice. Octavianus made use of these facts to excite the indignation of the Roman people against A., and a war between the rivals became unavoidable. A., in his idleness, tried to postpone the trial of strength which he saw inevitably approaching, and filled the island of Samos (where his troops were quartered) with musicians, jugglers, and buffoons. Meanwhile, at Rome, he was deposed from the triumvirate, and war was proclaimed against Cleopatra. Each party collected its forces, and in the naval engagement which took place (31 B.C.), near Actium (q.v.), A. was defeated. His subsequent hope of finding troops still faithful to him in Libya was disappointed. He returned to Egypt, where, with Cleopatra, he once more forgot political cares and vexations, until his amusements were suddenly interrupted by the arrival of Octavianus at Alexandria. A. now roused himself, made a charge with his cavalry, and repelled the enemy; but the advantage was only momentary. Deserted by the Egyptian fleet, as by his own army, and suspecting that even Cleopatra had conspired against him, he went to her palace, from which the queen had escaped. Deceived by a false message informing him of the death of Cleopatra, A. committed suicide by falling upon his sword, in the year 30 B.C.

**ANTONIUS**, or **ANTONY OF PADUA**, SAINT, was b. at Lisbon, Aug. 15, 1195, and, on the father's side, was related to Godfrey of Bouillon. He was first a monk of the Augustine order, and in 1221 became one of the most active propagators of the order of Franciscans. On his missionary voyage to Africa, being cast on the coast of Italy, he preached with great success at Montpellier, Toulouse, Bologna, and Padua, where he d., June 13, 1231. The legends of A. of P. are full of absurd fables. Among others, we are told that his eloquence as a preacher was so great that even the fish in the sea were deeply affected by it! His anniversary falls on June 13. His monument, a fine work of statuary, is in the church which bears his name at Padua.

**ANTONOMASIA**, in rhetoric, the substitution of any epithet or phrase for a proper name; as, "the Stagyrte," for Aristotle; "the little corporal," for Napoleon; "the man on horseback," for Grant, etc. Sometimes the process is reversed; as, calling a good orator a "Cicero." In both cases the figure is akin to metonymy.

**ANTON ULRICH**, second son of duke Ferdinand Albert of Braunschweig-Wolfenbützel (till 1735, Braunschweig-Bevern, the title by which the prince was first known in Russia), was b. in 1714. When the Russian empress Anna was looking out for an alliance for her niece, Anna Carlowna, princess of Mecklenburg-Schwerin, the influence of Austria led her to choose A. U. Accordingly, he came to Russia, in 1733, was appointed colonel of a cuirassier regiment, and placed in the receipt of a considerable pension. The marriage was, however, long delayed. The princess showed a decided distaste for the insignificant character of the bridegroom-elect, and only married him to avoid a still more hated union with the son of Biron. The birth of the prince Ivan took place in 1740, a year after the marriage. About the same time, the empress falling dangerously sick, appointed the infant prince her successor, and Biron regent. After her death, A. U. made some feeble attempts to reverse this appointment, which only led to the punishment of those supposed to have instigated them, and to his own military

degradation. Biron's conduct towards the parents of the infant prince becoming unbearably insolent, Anna appealed in despair to gen. Münnich, who put a sudden end to Biron's sway, and declared the grand-duchess and her husband regents. After a few months, Anna ungratefully overthrew Münnich. After his fall, as little unity prevailed between the ministers at the helm as between herself and her husband, and the government was looked upon as both a foreign and a contemptible one. Then came the revolution of the 5th Dec., 1741, which in one night raised Elizabeth (q.v.) to the throne. A. U. and his consort were exiled, and lived long at Cholmogory, in the government of Archangel. Three children were born to them in exile. Anna d. in 1746. Catharine II. offered A. U. his freedom, but he declined it. Ultimately, he grew blind. The exact year of his death is uncertain, but it is supposed to have taken place about 1780. Catharine offered to his children an asylum in Jutland, where they all died in comfortable circumstances.

**ANTONY, SAINT**, surnamed **THE GREAT**, and also **ANTONY OF THEBES**, the father of monachism, was b. about the year 251 A.D., at Koma, near Heraklea, in upper Egypt. His parents were both wealthy and pious, and bestowed on him a religious education. Having, in obedience to what he believed to be a divine injunction, sold his possessions, and distributed the proceeds among the poor, he withdrew into the wilderness, where he disciplined himself in all those austerities which have hallowed his memory in the Catholic church, and formed the model of the monastic life. When 30 years of age, however, desirous of obtaining a deeper repose than his situation afforded, he penetrated further into the desert, and took up his abode in an old ruin on the top of a hill, where he spent twenty years in the most rigorous seclusion; but, in 305, he was persuaded to leave this retreat by the prayers of numerous anchorites, who wished to live under his direction. He now founded the monastery of Faioum, which at first was only a group of separate and scattered cells near Memphis and Arsinoë; but which, nevertheless, may be considered the origin of cenobite life. The persecution of the Christians by Maximian, in 311 A.D., induced St. A. to leave his cell, and proceed to Alexandria, in the hope of obtaining the crown of martyrdom; but, having failed in this, he returned to his solitude in the course of a year, which, however, he soon left, and plunged yet deeper into the desert. At length he found a lodgment on a hill, about a day's journey from the Red sea; but his disciples, discovering his retreat, so pressed him with their affectionate importunities, that he ventured to accompany them back. After many pious exhortations, he once more left them, and soon became the mighty oracle of the whole valley of the Nile. In 355, the venerable hermit, then 104 years of age, made a journey to Alexandria to dispute with the Arians. He had interviews with Athanasius and other distinguished persons; but feeling his end approaching, he retired to his desert home, where he d., 356 A.D.

Athanasius states, in his *Life of St. A.*, that the saint wore only a coarse shirt of hair, and never washed his body, which is more credible than the stories he relates of his encounters with the devil, or his miracles. His whole conduct indicates the predominance of a glowing and yet gloomy fancy, which is the proper condition of religious asceticism. Although the father of monachism, St. A. is not the author of any monastic "rules;" those which the monks of the eastern schismatic sects attribute to him are the production of St. Basil. He is, perhaps, the most popular saint in the Catholic church. Accounts of his life and miracles are given in the *Acta Sanctorum* of the Bollandists, under the date of the 17th Jan., on which day his festival was kept.

**ST. ANTHONY'S FIRE.**—The Rev. Alban Butler, in his *Lives of the Saints*, gives the following account of the origin of this name: "In 1089, a pestilential erysipelatos distemper, called the *sacred fire*, swept off great numbers in most provinces of France; public prayers and processions were ordered against this scourge. At length, it pleased God to grant many miraculous cures of this dreadful distemper to those who implored his mercy through the intercession of St. A., especially before his relics; the church [of La Motte St. Didier, near Vienne, in Dauphiné] in which they were deposited was resorted to by great numbers of pilgrims, and his patronage was implored over the whole kingdom against this disease." The "order of canons regular of St. Anthony," a religious fraternity, founded about 1090, for the relief of persons afflicted with the fire of St. A., survived in France till 1790.

**ST. ANTHONY'S WELL**, a small fountain near the ruined chapel of St. A., on the northern slope of Arthur's seat (q.v.), near Edinburgh. This interesting fountain, which consists only of a stone basin, into which water trickles from under an incumbent rock, is celebrated in the Scottish song—"O, waly, waly."

**ANTRAIGUES**, EMANUEL-LOUIS-HENRI DELAUNAY, Count of, a great politician, but very ambiguous character, was b. at Vivarais, in the department Ardèche, in 1765, and was educated under the Abbé Maury. His superior talents were first displayed in his *Mémoire sur les Etats généraux, leurs Droits et la Manière de les convoquer* (1788). This book, full of daring assertions of liberty, was one of the first sparks of the fire which afterwards rose to such height in the French revolution. In 1789, when A. was chosen as a deputy, he not only defended the privileges of the hereditary aristocracy, but also ranked himself with those who opposed the union of the three estates; while in the discussions on the constitution, he maintained that the royal veto was an indispensable part

of good government. After leaving the assembly, in 1790, he was employed in diplomacy at St. Petersburg and Vienna, where he defended the cause of the Bourbons. In 1803, he was employed under Alexander of Russia in an embassy to Dresden, where he wrote against Bonaparte a brochure, entitled *A Fragment of the 18th Book of Polybius, discovered on Mount Athos*. He afterwards came to England, and acquired great influence with Canning. Despite his attachment to the interests of the Bourbons, he could never win the confidence of Louis XVIII. In 1812, he was murdered, with his wife, at his residence near London, by an Italian servant, who, immediately after the act, committed suicide.

ANTRIM, a co. of Michigan, in the n.w. part of the lower peninsula, on Grand Traverse bay; 700 sq.m.; pop. '74, 3240. Farming is the main business. Co. seat, Elk Rapids.

ANTRIM, a maritime co. in the n.e. of Ireland, in the province of Ulster; bounded, n., by the Atlantic; w., by the n. part of the river Bann, dividing it from Londonderry, and by lough Neagh; s., by Lagan river, separating it from the co. of Down; s.e., by Belfast lough; and e. by the Irish channel. It stands third among the Irish counties in population, but in extent only ninth. Its greatest length is 56 m.; its greatest breadth, 20; its extent of sea-coast, 90 m. Area, 1164 sq.m. About two thirds of this is arable; a fourth, barren; and a seventy-fourth in woods. Pop. in '51, 352,264; '61, 368,948; '71, 404,015, of whom 184,144 were Presbyterians, 108,835 Roman Catholics, 88,934 Episcopalians, and the rest of other denominations. Off the n. coast lie Rathlin isle and the Skerries; and off the e. coast, the Maiden rocks. The e. coast is hilly; and from Larne to Fair Head, parallel mountain-ranges of no great height, and covering a third of the county, stretch s.w. into the interior, forming valleys opening seaward, called the glens of Antrim. The interior slopes towards lough Neagh. The highest eminences are—Trostan, 1810 ft.; and Slievemish, or Slemish, 1782 ft. The principal streams are—the Bann, from lough Neagh to the Atlantic; the Main, running parallel to the Bann, but in the reverse direction, into lough Neagh; and the Bush, flowing n. into the Atlantic. Many peat-bogs occur in the county. Six sevenths of the surface consists of basaltic trap, often alternating with red ochre, and overlying hardened chalk, green-sand, new red sandstone, and mica-slate. The surface and edges of the trap-field, in some places, present basaltic columns of varied outlines. The green-sand and new red sandstone crop out on the e. and s.e. borders, and millstone grit occurs in the n.e. Between Ballycastle and the mouth of the Bann, the basalt assumes very picturesque forms; and the Giants' causeway is one of the most perfect examples of columnar basalt in the world. Fine salt-mines occur at Duncrue and Carrickfergus; and small coal-fields near Ballycastle and in the interior. Rich beds of iron ore of fine quality have been recently opened in Glenravel, and a large export has been carried on from Cushendall and Carnlough. The soil of A. is mostly light, and the chief crop is oats. In 1878, 246,498 acres were under crop, 81,760 being in oats, 45,831 in potatoes, and 5372 in wheat. The land is very much subdivided; and the rearing of flax, and the various branches of the linen, cotton, and coarse woollen manufacture, employ a great portion of the people. In 1878, there were upwards of 91,000 pupils on the rolls of the national schools in the county (22,000 being Catholics). The principal towns are—Belfast, Lisburn, Ballymena, Ballymoney, Carrickfergus, Larne, and Antrim. A. co. returns two members to parliament; Belfast borough, two; and Carrickfergus and Lisburn boroughs, each one. The inhabitants are mostly Presbyterians, the county having been extensively colonized from England and Scotland. The original possessors were the O'Neills, who, partially dispossessed by John de Courcy, reappeared as chief, on the failure of his line, and in 1533 regained the whole country, except Carrickfergus and part of the glens—held by the Bissets of Glenarm. The forfeiture of Shane O'Neill terminated the dominion of his race.

ANTWERP (in French, ANVERS), the capital of the province which bears its name, and the chief commercial city of Belgium, is situate on the river Scheldt. Pop. '76, 150,650. Its chief public institutions are—the Academy of Sciences, Academy of Painting and Sculpture, formerly known as the Academy of St. Mark, a medical and surgical school, naval arsenal, museum, and zoological gardens. The cathedral, one of the noblest gothic structures in Europe, is 500 ft. in length by 240 in breadth, with a roof supported by 125 pillars, and a very lofty spire. The interior is enriched by the two greatest of all the pictures of Rubens, the Elevation of and the Descent from the Cross. The church of St. James contains the monument of the Rubens family. The new fortifications, recently erected, render the commercial capital of Belgium one of the most strongly fortified places in Europe. The trade and manufactures of A. have recently greatly extended, and the large dock and quay accommodation having been found too limited, steps have been taken for making a new quarter of the town, with ample harbor-room, on the opposite side of the Scheldt. The manufactures consist chiefly of sugar, white-lead, cotton goods, point-lace, linen thread, carpets, gold and silver lace. It is still celebrated for its sewing-silk, black silk stuffs, and printer's ink, as it was in former times for its velvets, damasks, and satins. There are also to be mentioned tobacco-manufacture, the cutting of diamonds and other precious stones, and ship-building.

A. is mentioned as early as the 8th c.; in the 12th and 13th it gave signs of considerable prosperity, and in 1550 numbered more than 200,000 inhabitants. The union of Belgium with Holland in 1815 was very favorable to the commerce and general prosperity of A. By the revolution of Aug., 1830, it was linked to the destiny of Belgium. When the revolutionary party gained possession, the commandant, gen. Chassé, retreated to the citadel, and, exasperated by the breach of truce, commenced a bombardment, which destroyed the arsenal and about thirty houses. In 1832, a French army of 50,000 men, under marshal Gérard, appeared before A., to demand the surrender of the citadel, which gen. Chassé refused. After the interior of the citadel had been reduced to ruins by the French artillery, gen. Chassé capitulated; the Flemish fortification, and the forts Burght, Zwindrecht, and Austroewel were surrendered to the Belgian troops, and the Dutch troops were taken to France, as hostages for the surrender of the forts Lillo and Liefkenshoek, according to an article in the negotiation of Nov. 15, 1831, which stipulated that the five citadels held by the Dutch troops in Belgium should be surrendered.

**ANUBIS**, an Egyptian deity, styled Anepu on hieroglyphic monuments, was, according to mythology, the son of Osiris and Nephthys. By the Greeks, he was frequently styled Hermes or Hermanubis, combining the Egyptian with the Grecian name. He is represented on monuments as having the head of a jackal, with pointed ears and snout, which the Greeks frequently changed to those of a dog. Sometimes he is seen wearing a double crown. A white and yellow cock was sacrificed to him. His office, like that of Hermes Psychopompus among the Greeks, was to accompany the ghosts of the deceased into Hades (Amenthes), and there to assist Horus in weighing their actions, under the inspection of Osiris. As, in the time of the Romans, the Egyptian worship had spread beyond Egypt itself, the two conceptions of A. and Hermes were blent together, and the dog's head of the former was found united to the insignia of the latter.

**ANUPSHUHUR**, a t. of India, in the British district of Bolundshuhur, n.w. provinces, on the right bank of the Ganges, 73 m. e. from Delhi, on the route to Bareilly. The channel of the Ganges is here about a mile wide, but only about one fifth of that space is occupied by the stream in the dry season. The town is ill built and crowded, the houses either of mud or ill-cemented brick. Pop. '71, 10,644.

**ANUS, THE, AND ITS DISEASES.** The term *anus* is applied by anatomists to the lower or (in the case of animals) the posterior aperture of the intestinal canal; the rectum terminating externally in the anus. With regard to its anatomy, it is sufficient to state that it is kept firmly closed on ordinary occasions by the *external* and *internal sphincter* muscles, the former of which contracts the integument around the opening, and, by its attachment to the coccyx behind, and to a tendinous center in front, helps the *levator ani* muscle in supporting the aperture during the expulsive efforts that are made in the passage of the feces or intestinal evacuations; while the latter or *internal sphincter*, is an aggregation of the circular muscular fibres of the lowest part of the rectum, and acts in contracting the extremity of the tube. The main function of the *levator ani* muscle is expressed in its name, it being the antagonist of the diaphragm and other muscles which act in the expulsion of the feces. The integument around the anus lies in radiating plaits, which allow of its stretching without pain during the passage of the feces; and the margin is provided with a number of sebaceous glands, which, in some of the lower animals, secrete strongly odorous matters. See **ANAL GLANDS**. Infants are occasionally born with an imperforate *anus*, or congenital closure of the rectum. In the simplest form of this affection, the anus is merely closed by thin skin, which soon becomes distended with the meconium (q.v.). More complicated cases are those (1) in which the gut terminates some distance above the seat of the anus in a blind sac or pouch, (2) where the rectum terminates in the bladder, etc. Fortunately, the closure by a layer of skin is far the most common form of imperforate anus, and the little patient is at once relieved by a very simple surgical operation. If, however, no treatment be adopted, which is too often the case, in consequence of a popular delusion that the affection is incurable, the abdomen becomes distended and hard, vomiting comes on, the vomited matters soon assume a faecal smell, and the infant dies in a few days, either from exhaustion or rupture of the intestines.

*Spasm of the sphincter ani* is by no means a rare affection; it is characterized by violent pain of the anus, with difficulty in passing the feces. On attempting an examination, the muscle feels hard, and resists the introduction of the finger. It usually occurs in sudden paroxysms, which soon go off; but sometimes it is of a more persistent character. Its causes are not clearly known, and although most surgeons regard it as a special affection, some consider that the spasm is not a disease in itself, but merely a symptom of some slight excoriation or ulceration. Suppositories containing opium or belladonna introduced during the period of relaxation, are sometimes of use, and if there are ulcers, they must be specially treated. *Ulceration* occurring as a breach of surface at one or more points around the anus, but not extending within the orifice, is by no means uncommon in persons who are not attentive to cleanliness, and especially in women with vaginal discharges. Strict attention to cleanliness, the patient being directed to apply warm water to the parts at least twice daily with a sponge (which after each operation should be carefully rinsed out), and one or two applications of the solid

nitrate of silver, followed by black-wash, will effect a speedy cure. If the ulcer is seated partly *without* the anus and partly *within* the rectum, the distress is much more severe, and the treatment often requires the use of the knife. *Fissure of the anus* is a term applied to an affection consisting in one or more cracks, excoriations, or superficial ulcerations, situated between the folds of the skin and mucous membrane at the verge of the anus, and only slightly involving the rectum. They give rise to intense pain during the passage of the evacuations, and for some hours afterwards to great discomfort, smarting, and itching. The treatment to be adopted is to endeavor to procure regular and somewhat soft evacuations, and to sponge with warm water immediately afterwards, the parts being dried with a soft cloth. One or two applications of solid nitrate of silver will sometimes cure the disease; and an ointment of oxide of zinc, or one containing chloroform, will sometimes serve to allay the irritation and heal the parts.—*Pruritus ani*, which simply means intense itching and irritation of this part, is perhaps rather to be regarded as a symptom of certain morbid changes rather than as a special disorder; but as it is a very common affection, and is productive of much suffering, it must not be passed over. It is often associated with an unhealthy state of the intestinal secretions, or with simple constipation; with a congested state of the mucous membrane; with a disordered condition of the womb; with the presence of thread-worms in the rectum, etc.; and it is peculiarly common in persons whose occupations are sedentary. The affection is often much aggravated by the patient's being unable to refrain from scratching the parts, which leads to excoriations, ulcerations, thickening of the skin, etc. The symptoms are usually most severe when the sufferer begins to get warm in bed. If the affection arise from worms, or a loaded state of the large intestines, enemata and purgatives will give immediate relief. If unhealthy excretions exist, attention must be paid to the diet, and the occasional administration of a pill containing a grain of calomel and four grains of watery extract of aloes, together with the local application of soap and water to the parts, will often stop the itching. If there are any cracks or ulcers, nitrate of silver must be applied until they heal. To prevent the reappearance of these sores, the patient should bathe the parts night and morning with a strong solution of alum. An ointment composed of a drachm of calomel and an ounce of lard is strongly recommended by Mr. Smith of King's College hospital, when other means have failed; who also states that the daily introduction of a well-oiled bougie, made of black wax, will sometimes succeed in very obstinate cases. The other principal affections of the anus are *fistula*, *piles*, and *prolapsus*, which are discussed in special articles.

ANVIL, an iron block, with a smooth, flat, steel face, on which malleable metals are hammered and shaped. A.'s are of all sizes, from the tiny articles used by watchmakers to the immense masses for trip-hammer work in great iron foundries. The common A. of blacksmiths has a cone or horn at one end, and a socket for a chisel in the other. The best A. are made of cast iron, faced with steel, the steel being placed at the bottom of the mold and the iron poured upon it.

ANVILLE, JEAN BAPTISTE BOURGUIGNON D', a celebrated French geographer, b. at Paris in 1697, d. in 1783. He devoted his whole life to geographical science. Such was his natural taste for map-drawing that his first study of the ancient authors induced him to publish, at the age of 15, a map of Greece. His rare qualities gained him the friendship of the Abbé de Songuerue, from whom he received those instructions which were the source of that profound and extensive knowledge he subsequently acquired. He read the Greek and Latin historians and philosophers, as well as poets, specially noting the names and positions of cities and nations. He advanced the science of geography, not only by the vast number of maps which he executed, but also by the treatises, full of erudition and of historic and critical details, in which he discussed numerous interesting questions. The works of A. announced by M. de Maine many years ago, were to have been contained in 6 vols., exclusive of the volumes of maps. The principal portion was published in 1834 by Levrault. But the death of M. de Maine in 1832 stopped the quarto edition near the end of the twelfth volume, to which the map of Africa was however wanting, although the text had been added, with notes digested from the most recent investigations in that country. A. has left 211 maps and plans, and 78 memoirs, the most of which are inserted in the *Recueil des Mémoires de l'Académie des Inscriptions et Belles-lettres*. His best map is that of ancient Egypt. His *Orbis Veteribus Notus*, and *Orbis Romanus*, are also invaluable. The same remark applies to his maps of Gaul, Italy, and Greece, both ancient and medieval. His maps of modern countries contain all the knowledge attained in his time. His valuable collection of maps was purchased in 1779 by the French government for the royal library.

ANWARI, a celebrated Persian poet, who flourished during the 12th c., was b. in the province of Khorassan, and educated at the college of Mansur, at Tus. He emerged from obscurity in the course of a night. The story goes that the Seljukide sultan, Sanjar, happened on one occasion to visit Tus, when the imagination of the youthful poet was so excited by the presence of the monarch and his glittering retinue, that he resolved to write a poem in his praise. By next morning it was finished, and presented to Sanjar, who instantly placed the fortunate youth among his courtiers. A. now began to devote himself to astrology, which was his ruin; for having predicted that in 1185 or 1186 A.D. a hurricane would burst over all Asia, overthrow the most solid edifices, and shake the

very mountains, and nothing of the sort really occurring, but, on the contrary, an entire year of remarkably tranquil weather, he fell into disgrace, and had to retire to Balkh, where he died in 1200-1201 A.D.

His poems consist chiefly of lengthy panegyrics and shorter lyrical effusions. The latter (*ghazels*) are characterized by simplicity, ease, and naturalness; but the *kasidas*, or long poems, are disfigured, like many other eastern poems, by glittering imagery and historical conceits. His *Eggy on the Captivity of Sanjar taken Prisoner by the Ghurides* has been translated into English by captain Kirkpatrick in the first volume of *Asiatic Miscellanies* (Calcutta, 1785).

ANZIN, a t. in the dept. of Nord, France, on the Scheldt, near Valenciennes, in the center of a most valuable coal-mining district. A. has iron foundries, glass-works, breweries, and distilleries. Pop. 7288.

AONIA, a district of ancient Greece, in which are Mt. Helicon (the Aonian mount) and the fountain Aganippe. In fable, A. was a favorite haunt of the muses, who were called "Aonides."

AONLAGANJ', or AOUNLAH, a t. of India, in the British district of Bareilly, 21 m. s.w. from Bareilly, on the route to Allygurh. It has a large bazar. Pop. '71, 9947.

AORIST, a form of the Greek verb by which an action is expressed as taking place in an indefinite (Gr. *aoristos*) time. The Greek language is especially fertile in the past tenses of verbs, having, in addition to the tenses common to other languages—namely, the imperfect, perfect, and pluperfect—the A., which is peculiarly adapted to the narrative style of writing. The distinction of first and second A. is purely formal.

AORTA is the great arterial trunk which, rising from the left ventricle of the heart, sends its branches ramifying through the whole body. The A. in man is subdivided by anatomists into the arch, the thoracic A., and the abdominal A. The arch is a loop with the convexity directed upwards, forwards, and to the right side, reaching at its highest part to a level with the second piece of the breast-bone, and then descending to the left side of the third dorsal vertebra. Five arteries arise from the arch—viz., two coronaries, for the supply of the muscular tissue of the heart itself; the innominate; and the left carotid and left subclavian arteries. At the commencement of the arch are three small swellings or pouches, the aortic sinuses, below which are the three semilunar valves or folds of the lining membrane, which prevent regurgitation of the blood back into the heart. The thoracic A. extends from the third dorsal vertebra to the diaphragm, gradually getting into the middle line of the spine. The thoracic A. gives off the bronchial arteries (two or three) to supply the tissue of the lungs; and some small branches (three or four) to the œsophagus, and intercostal arteries, to supply the walls of the chest (ten on left, and nine on right side). The abdominal A. passes from the diaphragm to the fourth lumbar vertebra, opposite the lower margin of which it divides into the two common iliac trunks. The abdominal A. gives off the two phrenic arteries to the diaphragm; the celiac axis, which divides into three large branches for the stomach, liver, and spleen; the superior mesenteric for the small, and part of the large intestine; the renals (two); the supra-renals (two), one for each kidney; the spermatic; the inferior mesenteric, for the part of the large intestine not supplied by the superior mesenteric; and four or five lumbar arteries, which supply the lower part of the abdominal walls (the loins).

Where the A. bifurcates, a small artery, the *sacra-media*, or *caudal* artery, arises, and passes along in the middle line; in fish and in animals with large tails, this branch is a continuation of the A.

The above is the usual arrangement; but occasionally it varies, especially in the number of arteries springing from the arch. The structure of the A. will be given under ARTERY; and the comparative anatomy under HEART and CIRCULATION.

During foetal life, there is a communication between the arch of the A. and the pulmonary artery called the *ductus arteriosus*, the canal of which becomes obliterated after birth. It has been calculated that the velocity of the blood in the ascending part of the arch is  $2\frac{1}{2}$  in. in a second. The pressure of the blood in the A. of a horse has been estimated to be 11 lbs.; and in man's, 4 lbs. 6 ozs.

The coats of the A. are very subject to fatty disease termed atheronia (q.v.), and in advanced life, to calcare-

Aorta:

a, ascending arch of aorta; ss, coronary arteries; b, innominate artery; c, right subclavian; d, right carotid; e, left subclavian; f, thoracic aorta; gg, diaphragm; hh, phrenic arteries; i, celiac axis; k, coronary or gastric; l, splenic; m, hepatic; n, superior mesenteric; oo, renal arteries; p, inferior mesenteric; p', spermatic; q, common iliac; r, middle sacral.

ous degeneration or deposit of earthy particles, which destroys their elasticity. This change renders them very liable to aneurism (q.v.), which, as may be expected, is generally situated at the curves of the A., especially at the arch. Sufferers from this disease in the arch or thoracic A., suffer from palpitation within the chest, difficulty of breathing, occurring in paroxysms and during sleep, and shoots of pain through the chest. If the aneurism is on the arch, it generally presses forward, and may completely destroy the breast-bone, forming a pulsating tumor, covered only by the skin, or it may press up into the neck. If low in the chest, the aneurism may compress the thoracic duct, and cause emaciation. In the abdomen, the symptoms are pulsation and pain; but in both situations aneurism may exist for a length of time without attracting attention.

In some cases the A. has been found obliterated, showing that the lower extremities can be supplied with blood by the anastomosing branches. Sir Astley Cooper and other surgeons have tied the A. for aneurism, but without success.

**AOSTA**, a district of the province of Turin, in north Italy, surrounded by the highest elevations of the Alps, and watered by the river Dora-baltea. It contains an area of 1233 sq.m. The dense pine-woods on the hills, the alpine pastures on the slopes, the plantations of vines, almonds, olives, figs, and mulberry trees in the valleys, and the ores of silver, copper, and iron in the bosom of the mountains, supply occupation and means of subsistence to a pop. of about 83,000; but the land generally is not adapted to the growth of corn, though maize, barley, oats, etc., are produced in the lowest portions of the valleys. The disease styled cretinism (q.v.) prevails to a lamentable extent, and few persons are altogether free from goitre (q.v.). Great numbers of the poorer class emigrate during winter into the richer countries in their vicinity, and earn a livelihood as chimney-sweepers, masons, and smiths.—**AOSTA**, the principal t., 49 m. n.n.w. of Turin, contains 6700 inhabitants, and has a large trade in cheese, hemp, leather, etc. It was in ancient times the chief residence of the Salassi, a brave race of mountaineers, with whom Appian Claudius (134 B.C.) had to contend on his way into Gaul. They were finally destroyed by Terentius Varro in the time of Augustus. Monuments of the Roman times—a well-preserved arch, two gateways, the ruins of an amphitheater, and a bridge—still remain. The celebrated baths and mines of St. Didier are in the neighborhood. St. Bernard, the founder of the famous hospice which bears his name, was archdeacon of A.; and Anselm, archbishop of Canterbury, was b. here.

**APA'CHES**, Indians of Mexico, New Mexico, and Arizona; warlike nomads, roaming over Texas and the Mexican states. They wander and fight on horseback, and are usually at enmity with white men, resisting all efforts to Christianize or civilize them. Very few ever cultivate the soil, their living being derived chiefly from the chase and from robbery.

**APATI, MICHAEL I.**, Prince of Transylvania, was b. in 1632, of an old but decayed family. He accompanied prince George II. in an expedition against the Poles in 1656, but was taken prisoner at the irruption of the Tatar hordes under their khan, Mohammed Girai. After his release, he went and lived for a short time at his paternal estate; but in 1661 he was chosen prince of Transylvania, at the instigation or desire of Ali Pasha, generalissimo of the Turkish forces under sultan Mahmoud IV. During the peace concluded with Austria, he reigned peaceably under the protection of the porte, and acquired the towns of Clausenburg and Rathmar. He remained faithful to the Ottoman power till the siege of Vienna in 1683. Fortune then changed. The imperial troops penetrated into the country; and on the 12th of Aug., 1687, A. made a treaty with the emperor at Harkany, by which Transylvania was declared to be freed "forever" from Turkish suzerainty, and placed under German protection. At Fogaras, on the 1st of July 1688, the Transylvanian deputies assembled at the national diet, took the oath of fealty to the Hapsburgs as legitimate monarchs of Hungary. Ever since the death of his wife, Anna Bornemitz, in 1688, A. had been sorely afflicted both in body and mind, and died (April 15, 1690) on the eve of a fierce retributive war, commenced by his old allies, the Turks, who considered themselves ill used by his desertion of them. His son, Michael II., succeeded to the throne and its perils. The Turks, under the vizier Cuprigli, overthrew the imperial army, and took several places, such as Nissa, Widdin, Semendria, Belgrade, etc.; but the intestine troubles of the Ottoman empire hindered them, or rather count Tekeli, the adventurer whom they were helping, from retaining these towns. The imperial troops subsequently regained everything; and at length the young Transylvanian prince was inveigled to Vienna, and cajoled into giving up his dominions to Austria in lieu of a pension of 12,000 or 15,000 florins. He died in 1713.

**APANAGE** is not an English legal term, but is a technical word in the French law, in which system it signifies the assignment or conveyance by the crown of lands and feudal rights to the princes of the royal family, that they may be enabled to maintain themselves according to their rank. (See a long article on this subject in Knight's *Political Dictionary*, which refers to Rotteck and Welcker, *Staats-Lexicon*, art. by P. A. Pfizer. See also Merlin's *Répertoire de Jurisprudence* under this head.) The word A., however, is sometimes found in Scotch law-books, the Scotch lawyers having most probably derived it from France, whose system of laws was so largely imported into Scotland—the Court of Session itself having been modeled after the plan of the parliament of Paris. Mr. Erskine, in his *Principles of the Law of Scotland*, book i., tit. 4, sec. 8, says:

"The A., or patrimony of the prince of Scotland, has been long erected into a regality jurisdiction, called the principality. It is personal to the king's eldest son, upon whose death or succession it returns to the crown. The prince has, or may have, his own chancery, from which his writs issue, and may have his own chamberlain and other officers for receiving and managing his revenue;" and the late prof. Bell, in his *Principles of the Scotch Law*, calls this principality the prince's "perpetual A. and personal provision." In England, the duchy of Cornwall may be said to be an A. of the prince of Wales, in whose person, also, since the junction of the two kingdoms under the same crown, now merge the rights of the prince of Scotland. His royal highness, in fact, when he goes north, ought strictly to be called, not prince of Wales, but prince of Scotland.

In common parlance in England, the word A. is loosely used to denote any extra-territorial jurisdiction or sovereignty by governments or states; and even any dignity or right enjoyed by persons of rank.

**APATHIN**, a t. of Hungary, in the co. of Bacs, near the left bank of the Danube, 49 m. s.w. from Theresiopol. It has manufactures of woolen cloth, and a considerable trade in hemp, silk, madder, and woad, the products of the vicinity. Pop. '69, 11,047.

**APATITE** is the scientific and commercial name applied to a mineral mainly consisting of phosphate of lime (bone-earth), and which for some years past has been largely used in the preparation of manures. It is employed for the same purpose as bones or bone-ash—namely, to supply phosphoric acid to the soil. The massive radiated variety is sometimes called *phosphorite*, and when massive, earthy, and impure, it is also known as *osteolite*. Coprolites (q.v.), or phosphatic nodules, are likewise mainly composed of phosphate of lime. A. is found as a bedded rock, in compact spheroidal masses, in veins and dykes, and as an accessory constituent of rocks. It exists in nearly all geological formations, but is perhaps most abundant in the older metamorphic rocks. Extensive deposits of A. occur in various parts of the world. From Kragerø in Norway, where it occurs associated with granitic rocks, and from Estremadura in Spain, where it is found in cretaceous strata, it has been largely sent to England, the total imports of these mineral phosphates having in some years reached 5000 tons. There is a bed of A., 18 in. thick, of Silurian age, at Llanfyllin in North Wales, which has been extensively worked. A remarkable deposit of a kind of A., or rather rock guano, which has been termed "sombbreroite," was discovered some years ago in the small island of Sombbrero, situated about 60 m. to the e. of St. Thomas, in the West Indian group. It covers a great part of the island, which is about  $1\frac{1}{2}$  m. long, by  $\frac{1}{4}$ th of a mile in breadth. Mr. A. A. Julien, writing from the spot in 1864, says there "is a natural division of the sombrero guano into two varieties. One of an oolitic structure, of a great variety of colors, and containing, in addition to the bone ( $3\text{CaO}, \text{PO}_5$ ) and neutral ( $2\text{CaO}, \text{PO}_5$ ) phosphates of lime, the phosphates of alumina, iron, and magnesia, etc. The other variety, generally of a broad concretionary structure, is of a white or yellowish-white color, containing a little carbonate of lime, sulphate of lime, etc., but especially abounds in bone phosphate of lime. It is almost certain that the former more nearly resembles the original deposit, and is the older of the two; while the latter is far more uniform in composition. The guano is interlaminated with ordinary coral limestone." It is now believed that this hard or rock guano has been formed by water filtering through ordinary guano, into the coral rock adjoining, and turning it more or less completely into phosphate of lime. A similar hard guano occurs at Monk's island, and one or two others in the Caribbean sea. Large quantities have been introduced into this country, and still more into the United States, under the name of sombrero guano, and are extensively employed by the manufacturers of artificial manures, in place of ordinary bone-ash. The general treatment to which mineral phosphate is subjected, is to reduce it to powder, and act upon the pulverized matter with sulphuric acid, which renders the phosphoric acid in the A. soluble in water, and thereby facilitates its introduction into the plant. These substances require to be ground to a finer powder, and subjected to a more protracted digestion than bones. In the greater number of cases where the A. or sombrero guano is treated in this way, it is mixed with other manures, such as peruvian guano, blood, or true bones, and thus a complex substance is manufactured, which is much more acceptable to the plant than the simple A. or *mineral phosphate* itself. The great importance of mineral phosphate, in an agricultural point of view, arises from the fact that no mineral substance possesses more influence over the growth of the edible plants, such as wheat, barley, oats, turnips, etc., than phosphoric acid does; any cheap source of that substance, therefore, is a great boon. The island of Sombbrero contains as much phosphatic or bony matter as is present in many millions of oxen, and represents as much manure as would be obtained by the employment of the bones of these cattle. The different varieties of A. contain a little fluoride or chloride of calcium, or both, as well as phosphate of lime. Of these varieties, besides those already mentioned, there are others, as *morocite*, *francolite*, and *asparagus stone*. It occurs both massive and in crystals—which are generally small, and are often six-sided prisms, or six-sided tables, but some very large ones have been brought from Canada. It occurs in some of the tin mines in Cornwall, Saxony, Bohemia, etc., and in rocks of various ages, as mentioned above. It is found of various colors, more or less green, blue or red, sometimes white,

and often gray. The proposal to employ it as a manure first excited much interest in 1856, and began to be enterprisingly carried into effect, with happy results—rocks once deemed most barren being thus rendered conducive to the fertility of soils. In Spain, A. is used as a building stone.

**APE**, a name commonly given to the tailless monkeys. (See BARBARY APE, CHIMPANZEE, GIBBON, GORILLA, ORANG-OTANG, etc.) It was originally commensurate in signification with monkey, and the terms were indiscriminately used. The origin of the word is uncertain. See MONKEY.

The worship of apes or monkeys has been common among pagan nations from a period of remote antiquity, and still prevails very extensively, being practiced in Japan, in India, and by some of the African tribes. The source of it is perhaps to be found partly in the doctrine of the transmigration of souls, and partly in the qualities which apes have been supposed to possess in a conspicuous degree, and of which they have been made symbolic. An A.'s tooth, kept in a temple in Ceylon, was regarded with extraordinary veneration, and immense wealth was accumulated through the continual offerings of the worshipers; but the temple was plundered, and the tooth carried away by the Portuguese in 1554.

**A-PEAK**, or **A-PEEK**, a maritime term signifying the position of an anchor when the cable has been drawn so tight as to bring the ship directly over it; the sailors then say that "the anchor is a-peak."

**AP'ELDORN**, a beautiful village in the Netherlands province of Gelderland, is situated about 17 m. n. from Arnhem, on a canal which joins the river Grift, a branch of the Yssel, by which, and the public roads from Arnhem and Utrecht to Deventer and Zutphen, and by railway, it has much traffic. The Loo, a hunting-lodge of the king, is in the neighborhood. The principal industries are agriculture, making paper, grinding corn, founding copper, manufacturing blankets and coarse woollen cloth, etc. Pop. of A. (1st Jan., '75), 13,340.

**APEL'LES**, the most celebrated painter in ancient times, was the son of Pythias, and was probably, in accordance with the statement of Suidas, born at Colophon, on the Ionian coast of Asia Minor; though Pliny and Ovid call him a Coan, and Strabo and Lucian an Ephesian. This, however, may simply refer to the fact that he was made a burgess of that town. He flourished in the latter part of the 4th c. B.C.; received his first instruction in art in the Ionian school of Ephesus, then studied under Pamphilus of Amphipolis, and latterly at Sicyon, under Melanthius, and thus he united the fine coloring of the Ionian with the accurate drawing of the Sicynic school. During the time of Philip, A. visited Macedon, where he became the intimate friend of Alexander the great. It was probably at the Macedonian court that the best days of A. were spent. Pliny relates that on one occasion when Alexander visited A. in his studio, the king exhibited such ignorance of art that A. recommended him to be silent, as the boys who were grinding the colors were laughing at him. But the same story is told of Zeuxis and Megabyzus. He afterwards visited Rhodes (where he was familiar with Protogenes), Cos, Alexandria, and Ephesus. The period of his death is not known; but as he practiced his art before the death of Philip, and as his visit to Alexandria was after the assumption of the regal title by Ptolemy, he probably flourished between 352 and 308 B.C. The most celebrated paintings of A. were his Anadyomene, or Venus Rising from the Sea, with a shower of silver drops falling round her like a veil of gauze, the Graces, and similar subjects; but he cultivated the heroic as well as the graceful style. His ideal portrait of Alexander wielding a thunderbolt was highly esteemed, and preserved in the temple of Diana at Ephesus. With reference to this painting, Alexander said: "There are only two Alexanders—the invincible son of Philip, and the inimitable Alexander of A." A. is said to have left an incomplete painting of Venus, to which no other painter would presume to give the finishing touches. The disposition of A. was remarkably free from envy, and he willingly acknowledged the merits of his contemporaries. Amphion, he said, excelled him in grouping, and Asclepiodorus in perspective, but *grace* was his alone. On coming to Rhodes, and finding that the works of Protogenes were not appreciated by his countrymen, he at once offered him 50 talents for a picture, and spread the report that he intended to sell it again as his own. The industry with which he practiced drawing was so great as to give rise to the proverb, *Nulla dies sine linea*. Many other anecdotes are related of A. When his pictures were exposed to public view, he used to place himself behind a picture, to listen to the criticisms of the common people. A cobbler having detected a fault in the shoe of one of his figures, it is stated that A. instantly rectified it; but when the cobbler, on the following day, extended his criticism to the legs, the painter rushed from his hiding-place, and told the cobbler to stick to the shoes, or, in the Latin version, which has become proverbial, "*Ne sutor supra crepidam.*"

**APENNINES** (Ital. *Appennini*; anciently, Lat. *Mons Apenninus*), a mountain-chain extending uninterruptedly throughout the whole length of the Italian peninsula. It lies between 37° and 44° 30' N. lat., and 7° 40' and 18° 20' E. long., and belongs to the system of the Alps, from which it branches off at the Col de Tenda, near the sources of the Tanaro. From this point, the chain, under the name of the Ligurian A., girdles the gulf of Genoa,

in the immediate vicinity of the sea, and then runs inland to a considerable extent, forming the water-shed between the Adriatic and the Mediterranean, but gradually approaching the east coast, till, in the highlands of the Abruzzi, it is close upon it; after which it takes a south-western direction through Naples, dips under the sea at the strait of Messina, and reappears on the northern coast of Sicily. Recent geographers divide the A. as follows: 1. *The North A.*, from the Col de Tenda in the Maritime Alps to the pass of Borgo San Sepolero, in the neighborhood of Arezzo, on the eastern border of Tuscany. 2. *The Central A.*, from Arezzo to the valley of Pescara, which flows between the two Abruzzi. 3. *The South A.*, from the valley of the Pescara to cape Spartivento. 4. *The Insular A.*, or the Sicilian range. The leading feature of the A., wherever they approach the coast, is their extraordinarily steep declivities; while in middle Italy and the adjoining portions of upper and lower Italy, long terraced plateaus, lower ranges, and, finally, extensive coast-plains, mark their gradual descent on the west. The general name for these lower ranges is *Sub-Apennine*; but they have a variety of particular designations, such as, the mountains of Carrara and Seravezza, Protomagno and Monte Amiata, in Tuscany; the Sabine, Alban, and Volscian mountains, in the former papal states; Monte Gargano on the s.e. coast, n. of Manfredonia, etc. The main chain of the A. does not send off spurs into the Apulian peninsula, or heel of Italy, which, for the most part, is rather level, or only interspersed with detached groups of hills.

The direction of the great chain of the A. is favorable to the formation, on the w. side, of important river-basins, such as those of the Arno, the Tiber, the Garigliano, and the Volturno; while, on the e. side, we find nothing but small streams, in most cases, destitute of affluents, hurrying down to the sea through wild precipitous valleys. In northern Italy, the Ligurian A., almost overhanging the gulf of Genoa, can only develop on the s. puny streams, while the n. sends down, through the plains of Piedmont, large tributaries to the Po.

The average height of the entire chain of the A. is about 4000 ft., which, however, in the n., sinks down to little more than 3500 ft.; and in the mountains of the Abruzzi, rises to 7000 feet. Here, in Monte Corno, the highest peak of the range known under the name of Gran Sasso d'Italia, they reach an elevation of 10,200 ft., and in Monte Velino of 7850 feet. The North A. attain, in Monte Cimone, situated in the s. of Modena, a height of 6973 ft.; the South A., in Monte Amara, a height of 9000 ft.; the Insular A., if we exclude the isolated peak of *Ætna*, in Pizzo di Case, a height of 6500 feet.

The A. are crossed by 13 principal passes; these are, proceeding from n. to s.—1. The pass of Savona; 2, of Bocchetta; 3, of Cisa; 4, of Monte Cimone; 5, of Porretta; 6, of Pietramala; 7, of Borgo San Sepolero; 8, of Furlo; 9, of Serravalle; 10, of Aquila; 11, of Isernia; 12, of Arcano and Troja; 13, of Potenza. The prevalent stone is a species of compact limestone, of a whitish-gray color, belonging to the Jura formation. Resting on the limestone is found a more recent formation of sandstone and marl, which is especially abundant in the middle region of the Sub-A., contains an extraordinary number of petrifications, and must be reckoned as belonging to the upper division of the Parisian limestone. Older formations, however, frequently crop out. Thus, for instance, on the water-shed of the North and Central A. there are found transition clay-slate, grauwaacke-slate, etc. The A., especially the Roman and Neapolitan, are distinguished from all other mountain-chains by the rich variety of marbles which they contain. In some places the quarries seem inexhaustible. Volcanic rocks are numerous in the middle and southern regions, where the agency of fire has caused very wonderful formations, as, for instance, the crater-lakes of Albano, Nemi, Vesuvius, Solfatara.

The principal chain exhibits, for the most part, a dreary and barren appearance; it looks like a vast wall, with very few projecting peaks to break the dull monotony of the scene, and therefore seldom furnishes any salient points on which the eye of the spectator can rest with pleasure. Naked, riven, covered with thick *débris*, the declivities seem as if scorched by the southern sun. Only in the Abruzzi, in the sub-A., and above all, in the marble mountains of Carrara and Seravezza, do the bold and magnificent forms of the Alps reappear. Where the A.—in general so poorly supplied with streams—exhibit a trace of Alpine abundance of water, there is no lack of rich pastures and dense forests, but usually only thin grass and wild scrubby bushes cover the stony slopes. The greater number of the roaring forest brooks, in the deep rocky ravines, display, during summer, only a dry bed. Where the mountains dip down to the sea, as at the riviera of Genoa, and the gulf of Naples, a rich, peculiarly southern vegetation clothes the declivities. Gigantic agaves, Indian figs (*cactus opuntia*), myrtle-bushes, orange-groves, hint in these northern lands of the splendors of the tropics. Up to 3000 ft. of elevation, cornfields, fruit bearing chestnuts, and deciduous oaks are found. Beyond this, all vegetation often ceases on the steep and stony sides of the mountains; but at other times the beech or the fir appears in dense forests. There is no region of perpetual snow; but the summits of the Abruzzi and the lofty peaks of Lunigiana, are often covered with snow from Oct. far into May, and send their icy breath so suddenly down into the mild valleys, that the temperature in a few hours sinks 12° to 18° F., and a warm spring afternoon is succeeded by a bitter Dec. evening.

**APENRA'DE**, a t. in the Prussian province of Slesvig-Holstein, situated at the bottom of a gulf in the Little Belt, has an excellent harbor, and a considerable amount of ship-

ping. Pop. '75, 6176. The environs of the t. are beautiful. The first historical mention made of A. relates to its destruction by the Slaves in 1148; and, indeed, its position has always laid it open to the casualties of northern war, whether on a large or small scale, as has been especially seen since 1848. Near the t. stands the castle of Brundlund, built by queen Margaret in 1411, in which the bailiff of the place resides.

**APETALOUS**, a term in botany, applied to flowers or to flowering plants, and signifying that they are destitute of petals or corolla (q.v.). When both the calyx and corolla are wanting, the flower is said to be *achlamydeous* (from the Greek *chlamys*, a covering), or naked. The absence of the whorl of petals sometimes occurs in an exceptional manner in orders or genera ordinarily characterized by its presence. In some plants, as in certain species of the order *caryophyllaceæ*, petals are sometimes present, sometimes absent, a tendency apparently existing to the suppression of this whorl.

**APHANIP'TERA**, or **APHANOPTERA**, a term applied to an order, sub order, or family of wingless insects, composed of various species of fleas, forming the family pulicidæ, and closely allied to the flies. The common flea may be considered a type. Another is the chigoe of South America, an insect whose burrowing in the flesh produces troublesome ulcers.

**APHASIA** (Gr. *a*, not, and *phasis*, speech) is a term adopted by the eminent French physician, Trousseau, to denote a remarkable symptom of certain conditions of the nervous system in which the patient is more or less unable to express his thoughts in speech. The disease has been casually noticed by many earlier observers, amongst whom Dr. Parry of Bath may be especially noticed; but it was not until within the last 20 years that it has received the attention which its great singularity demands. Before receiving its present name, it had been termed *aphemia* (from *a*, not, and *phemē*, I speak), and *alalia* (from *laleo*, I talk). Voisin, in an elaborate memoir on this subject, published in 1865, observes that it may be due to several causes. It may be congenital or acquired, and in the latter case is due to some form of lesion or injury of the anterior lobes of the brain. This fact was observed as long ago as 1825 by Bouillaud; but in 1861, during a discussion of the anthropological society of Paris, as to whether certain faculties, such as language, are or are not localized in special parts of the brain, Broca advanced the view, that the faculty of language has its seat not only in the anterior lobes, but in the left lobe, and occupies exactly the external left frontal convolution, where the anterior lobe meets the middle lobe immediately in front of the fissure of Sylvius. This singular conclusion was deduced from only two post-mortem examinations which had just occurred at the Bicêtre, but a number of previously published cases supported it; and Dr. Hughlings Jackson, of the London hospital, "has seen about seventy cases of loss or defect of speech with hemiplegia, and in all but one, the hemiplegia was on the right side, indicating disease of the left side of the brain."—*Lancet*, Nov. 26, 1864. Moreover in the two cases which during the year last named proved fatal in the Edinburgh and Glasgow infirmaries, Dr. Sanders and Dr. Gairdner traced the disease to the *exact spot* described by Broca. It may be caused by wounds, tumors of various kinds, including hydatids, or by softening of the left anterior lobe, and has occasionally, but very rarely, been found in association with lesions of other parts of the cerebrum, and even of the cerebellum and spinal cord. According to Voisin, in 146 cases, the left anterior lobe was affected in 140, and the right in only 6 cases. A variety of aphasia has been noticed in typhoid fever and in the first stage of small-pox; also in certain chronic cachexias or intoxications, as for example, in syphilis and chronic alcoholism; and there are cases in which the affection is purely nervous, and results from epilepsy, an overtaxed brain, etc. The patients in whom true aphasia from disease of the brain occurs, are excellently described by Dr. Gairdner in his essay *On the Functions of Articulate Speech, etc.* (Glasgow, 1866). This description, in a condensed form, is as follows; These patients have been the subject of some form of disturbance of the cerebral functions, sometimes with, but sometimes also without a manifest disturbance of the intellect. It may have been epilepsy or apoplexy, in which latter case, as has been already noticed, there is often paralysis, almost invariably on the right side of the body. This paralysis may be of any extent of completeness, but in many cases the patient has such command over the movements of the tongue and lips, as to show that it is not from paralysis his speech is affected. The states of intellect and consciousness are equally variable the patient occasionally appearing and behaving as if he were in perfect bodily and mental health, except for the aphasia. Moreover, the aphasia itself shows itself in the most varied forms. In the more trivial cases, it is little more than an aggravation of the common defect of forgetting, or being unable to recall the name of a person or thing when wanted. Dr. Gairdner records the case of what he calls "an aphasic," who could conduct an ordinary conversation pretty well, but who could not name the days of the week, and would, for instance, call Monday "the first working-day," and who had forgotten, or could not give utterance to his own name. Sometimes a patient will perfectly articulate such expressions as these: "I want —, I want —, Where's the" —, almost always stopping short at the name of the object. Sometimes the patient's vocabulary is limited to one or two common words, as "yes" or "no;" or perhaps he utters only one or more unintelligible words, as in the case of one of Trousseau's patients, who for four months uttered nothing but "*Cousine*" to every possible

question, unless when in moments of great irritation, and he would then articulate "*Sacon, sacon*"—probably an abbreviation for a French oath. Strange to say, certain aphasics who can articulate absolutely nothing else, can swear with perfect facility. Such exclamations as "Oh!" "Dear me!" "God bless my life!" and "D—n it!" are often the only utterances of these patients. Dr. H. Jackson, in a memoir on aphasia, in the first volume of the *London Hospital Reports*, has made some excellent remarks on this peculiarity, which are well worthy of perusal by all who study mental philosophy. He ingeniously regards an oath not as a part of language, but as "a sort of detonating comma." The general reader may also read with advantage the histories of two cases recorded by Trousseau, in which Frenchmen of high mental capacity, and well acquainted with the disease (one of them an eminent physician in Paris, who had specially studied the diseases of the brain; and the other, prof. Lordat of Montpellier), have passed through attacks of aphasia, have recovered, and have described their own cases.

Aphasia may be either temporary or persistent; in the former case, being due to loss of nervous energy, congestion, or some other functional disorder; while in the latter case, it is probably associated with disease of structure. It is unnecessary to describe the treatment, which varies according to the peculiarity of each individual case, and must be left solely in the hands of the physician.

**APHELION**, that point in the elliptical orbit of a planet which is most remote from the sun. The opposite point, or that nearest to the sun, is styled the **PERHELION**. At the former point, the swiftness of the planet's motion is least, and begins to increase; at the latter, it is greatest, and begins to decrease. This irregularity of motion is most remarkable in comets whose orbits deviate most from the circle. The motion of the comet of 1680, at its perihelion, was calculated as 137,000 times more rapid than its motion in A. See **APSIDES**.

**A'PHIS**, a genus of insects belonging to the order hemiptera, sub-order homoptera—the type of a family called *aphidii*. They are small insects, living by sucking the juices of plants, upon which they may be seen congregated in immense numbers, often doing serious injury, causing the distortion of leaves, and even the blight and decay of the plant. The woolly aphid, or American blight (*A. lanigera*; *eriosoma mali* of Leach), is sometimes very injurious to apple-trees, and when once it has found its way into a garden or orchard, is very difficult of removal. It is a minute insect, "covered with a long cotton-like wool, transpiring from the pores of its body"—"a cottony excretion"—in which it differs from the ordinary aphides, and takes its place in the chinks and rugosities of the bark, multiplying rapidly, extracting the sap, causing diseased excrescences; and, ultimately, the destruction of the tree. It was first observed in England in 1787; but it is uncertain if it was, as has been supposed, accidentally imported from America. The hop-fly (*A. humuli*), and the A. of the turnip and cabbage (*A. brassicae*), have sometimes caused the destruction of entire crops. The price of hops varies from one year to another, very much according to the numbers in which "*the fly*" has appeared. The potato A. (*A. vastator*) has been represented as the cause of the potato disease; but this opinion has few supporters. The aphides of the rose (*A. roseae*) and of the bean (*A. fabae*) are among the most familiarly known. Every one must have observed the leaves of trees and shrubs deformed by red convexities. In the hollows of the under side of these, aphides have their habitation, and there they find their food; the exhausted leaf at last curls up. Most of the species are green; the A. of the bean is black. They are generally called plant-lice. They have a proboscis (*haustellum*), by which they pierce and suck plants; and at the extremity of the abdomen, two horn-like processes, from which exude frequent small drops of a saccharine fluid called *honey-dew*, a favorite food of ants. It has been seen even to fall in a kind of shower from trees much covered with aphides. Mention has been made in the article **ANT**, of the means which ants take to obtain this food. The legs of aphides are long, and they move slowly and awkwardly by them. The greater number of them never have wings; it is in the autumn that perfect winged insects generally appear. From the pairing of these result eggs, which produce female aphides in the following spring, and successive generations of wingless aphides are produced in a viviparous manner without impregnation throughout the summer, after which winged aphides again appear. Their increase is restrained not only by birds, but by insects which feed on them. A family of coleopterous insects, to which the genus *coccinella* or lady-bird (q.v.) belongs, has received upon this account the name of *aphidiphagi*, or aphid-eaters. There are also certain minute hymenopterous insects, which destroy them in great numbers by depositing their eggs in them; the larva feeds upon the living A., out of which it at last eats its way, leaving a mere desiccated skin.

**APHONIA** (Gr. *a*, not, and *phonè*, voice) is the term used in medicine to signify a more or less complete loss of voice. It is altogether distinct from mutism, in which it is impossible to form articulate sounds, and in most cases the voice is not entirely gone, but only more or less lost or suppressed. The voice is essentially produced (as has been proved in the special article on that subject) by three distinct agents—viz., (1) the expiration of air, (2) the opening of the glottis, and (3) the tension of the vocal cords—and hence anything interfering with expiration, or with the functions of the glottis and vocal cords, may cause aphonia. Thus, it may result from paralysis of the respiratory muscles,

from pulmonary emphysema, and sometimes from pneumonia; or it may be caused by diseases of the larynx, as chronic laryngitis, œdema of the glottis, polypus, etc.; or by pressure on the larynx caused by abscesses, vegetations, and any kind of morbid growth; or it may be traced to some functional or organic disturbance of the inferior vocal cords. Thus, the muscular fibres which act on these cords may become affected in acute laryngitis by extension of the inflammation, or their action may be impeded by the pressure of false membrane in croup. In typhoid fever, the aphonia which is so commonly observed is due to ulceration extending to these structures. Again, in cases of lead or phosphorus poisoning, there is aphonia due to fatty degeneration of the muscles. Not unfrequently, aphonia may be traced to compression of the recurrent or inferior laryngeal nerve, which is the nerve supplying motor power to all the muscles of the larynx, with one trifling exception.

Such pressure is not unfrequently caused by an aneurism, an abscess, tumor, etc. In the same way, a wound or contusion of the pneumogastric nerve, or one of the recurrent branches, will cause aphonia, or, more commonly, an extremely hoarse modification of the voice, in consequence of the laryngeal muscles being paralyzed on one side, and remaining active on the other. There are cases of direct nervous action being interfered with; but there are many cases of what may be termed *reflex aphonia*, as when the voice is often more or less lost in the course of pregnancy when accompanied with convulsions, or in consequence of the presence of intestinal worms, or after the rapid suppression of an exanthematous rash, or of a long-continued hemorrhagic discharge. Aphonia is, moreover, very commonly associated with hysteria.

When aphonia is not due to irremovable causes, as tumors pressing on the recurrent nerve, fatty degeneration of the laryngeal muscles, etc., it generally disappears after a longer or shorter interval. It occasionally assumes remarkable intermittent shapes. In one instance, the affection came on regularly at the same time of the year for 17 years, beginning daily at noon, and lasting the remainder of the day, for a period varying from 3 to 7 months. Another case is recorded in which during 14 years, a young woman could only speak during two or three hours daily.

In those cases which are amenable to treatment, emetics, electricity, strychnine, leeching, blistering, croton-oil liniment, and internal application of nitrate of silver, have been found to be the most useful remedies.

**APHORISM**, a maxim, or any short and significant saying; such as, "custom is a second nature." A whole piece or work is sometimes written in the form of a series of aphorisms, arranged in due order, and leaving their connection to be traced by the reader's reflection. In certain circumstances, this aphoristic style has an impressive effect; but long continued, it becomes wearisome.

**APHRODITE**, the Greek name of Venus, according to various traditions, is derived from *aphros* (foam), in allusion to the old poetical myth which represented the goddess as springing from the foam of the sea. See **VENUS** and **APELLES**. *Aphrodisia* were festivals celebrated in honor of A. in numerous cities of Greece, but especially in Cyprus. At Paphos, in this island, was her most ancient temple. Bloodless sacrifices alone were imagined to please A., such as flowers, incense, etc. Mysteries of an impure kind formed part of the ceremonial of the aphrodisia. Aphrodisia were no doubt held in the other places where A. was worshiped, such as Cythera, Sparta, Thebes, Elis, etc., though they are not mentioned. At Corinth and Athens, the aphrodisia were celebrated principally by prostitutes.

**APHTHA**. See **APTHÆ**, *ante*.

**APIACEÆ**. See **UMBELLIFERÆ**.

**APIACERE**. See **AD LIBITUM**.

**APIARY**. See **BEE**.

**APICIUS**, **MARCUS GABIUS**, a Roman epicure, who lived in the times of Augustus and Tiberius, and was celebrated for his luxurious table and his acquirements in the art of cookery. When, by the gratification of his favorite indulgence, he had consumed the greater part of his fortune, and had only some £80,000 left, he poisoned himself, in order to avoid the misery of plain diet. Two other gourmands—one in the time of Pompey, the other in the reign of Trajan—are mentioned under the name Apicius. The Roman cookery-book, *Cœli Apicii de Obsoniis et Condimentis sive de re Culinariâ* (libri decem), ascribed to A., belongs to a much later time, inasmuch as it abounds in inaccuracies and solecisms. Its author *Cœlius* has thought proper to recommend his work to gourmands by affixing to it the celebrated name of Apicius.

**APION**, a Greek grammarian, was born at Oasis, a t. in Libya, but educated in Alexandria, which he affected to consider his birthplace, from a desire of being thought a pure Greek. He studied under Apollonius, the son of Archibius, from whom he acquired an admiration of Homer, and afterwards went to Rome, where he succeeded Theon as teacher of rhetoric. He seems to have been as remarkable for his loquacious vanity as for his knowledge. He declared that himself, and every one whom he mentioned, would be held in immortal memory, that he was equal to the first philosophers of Greece, and that Alexandria should be proud of him. From his bragging, Tiberius used to call him *cymbalum mundi* (the cymbal of the universe).

With the exception of one or two fragments, the whole of A.'s numerous writings are lost. He composed a work on the text of Homer, partly in the form of a dictionary, which was frequently referred to by subsequent authors; a work on Egypt, which contained the far-famed story of *Androclus and the Lion*, preserved by Aulus Gellius; a work against the Jews; one in praise of Alexander the great; another on the great epicurean Apicius; histories of various countries, etc.

**APIOS TUBEROSA**, formerly included in the genus *glycine*, and called *G. apios*, a plant belonging to the natural order *leguminosæ*, sub-order *papilionaceæ*, having tuberous roots, a twining stem, dark red flowers, leathery, 2-valvular legumes, and pinnate leaves, with 7 pair of smooth ovato-lanceolate leaflets. This plant, which is a native of Virginia, has for a century been cultivated in botanic gardens in Europe, and has recently been brought into particular notice on the continent, in a great measure through the French traveler Lamare-Picquot, who, during his travels in North America, convinced himself of the value of the tubers as an article of food, for which they are there used to some extent. Various attempts have since been made to cultivate it like the potato; but its cultivation is found difficult, upon account of the length and weakness of the twining shoots and the length of the roots. The tubers cooked in steam are free from all acidity and bitterness, and very much resemble potatoes dressed in the same way. They contain more nitrogen than potatoes (4.5 per cent), also more starchy farina (33.55 according to an analysis by Payen).

**APIS**, the bull worshiped by the ancient Egyptians, who regarded it as a symbol of Osiris, the god of the Nile, the husband of Isis, and the great divinity of Egypt. A sacred court or yard was set apart for the residence of A. in the temple of Ptah at Memphis, where a numerous retinue of priests waited upon him, and sacrifices of red oxen were offered to him. His movements, choice of places, and changes of appetite were religiously regarded as oracles. It was an understood law that A. must not live longer than 25 years. When he attained this age, he was secretly put to death, and buried by the priests in a sacred well, the popular belief being that he cast himself into the water. If, however, he died a natural death, his body was solemnly interred in the temple of Serapis at Memphis, and bacchanalian festivals were held to celebrate the inauguration of a new bull as A. As soon as a suitable animal was found having the required marks—black color with a white square on the brow, the figure of an eagle on the back, and a knot in the shape of a cantharus under the tongue—he was led in triumphal procession to Nilopolis at the time of the new moon, where he remained forty days, waited upon by nude women, and was afterwards conveyed in a splendid vessel to Memphis. His theophany, or day of discovery, and his birthday, were celebrated as high festivals of seven days' duration during the rise of the Nile. The worship of the golden calf by the Israelites in the wilderness, and also the employment of golden calves as symbols of the Deity by Jeroboam, have been very generally referred to the Egyptian worship of A.

**APIS, APIDÆ.** See BEE.

**APIUM.** See CELERY.

**APLANATIC LENS**, an achromatic lens corrected for spherical aberration, so that all rays of light which emanate from one point and pass through the lens, are focused at a point. For this purpose the curves of a telescopic lens should be parabolic rather than spherical, and the figure is obtained by delicate hand-polishing. For microscopes and photographic cameras two or more lenses are so shaped that the errors of each are mutually neutralized. This important problem, although difficult, is practically solved by modern opticians.

**APOCALYPSE.** See REVELATION OF ST. JOHN.

**APOCALYPTIC LITERATURE**, alleged prophecies, epistles, etc., of late Jewish, and early Christian origin, written or compiled in or near the two centuries preceding and the two following the birth of Christ. Of the Jewish, the most famous is the *Book of Enoch*, quoted in the epistle of Jude, long lost, but found in Ethiopia and published in 1821. It gives an account of the fall of the angels, their intercourse with the daughters of men, and the birth of giants; Enoch's troubles in heaven and earth, attended by angels who explain the mysteries of the worlds, visible and invisible; descriptions of heaven, of the Messiah, of the future of the blessed, and of the condemned; accounts of the sun, moon, and stars; visions tracing the history of man from his origin to the completion of the Messianic kingdom; admonitory discourses; the wonders that were shown at Noah's birth, and Enoch's reflections about the future of the just and the unjust. In all, it is an interesting product of pre-Christian Judaism, multifarious, artificial, and rabbinical. The *Fourth Book of Esdras*, or the *Prophecy of Ezra*, consists of a series of visions attributed to that prophet, and relating chiefly to the oppression of the Jews. The *Book of the Jubilees*, or the *Little Genesis*, is only in part apocalyptic. It contains, in the form of revelations to Moses while he was on Mt. Sinai, statements relating to future races and times. The work was written about 100 B.C. The *Life of Adam*, the *Book of Adam's Daughters*, the *Assumption of Moses*, the *Apocalypse of Moses*, the *Sibyllines*, and the *Apocalypse of Baruch*, complete the list of noteworthy Hebrew works of the kind under consideration. The *Sibyllines* were doubtless sug-

gested by the Grecian oracles and books under that name. The Christian A. works are: the *Apocalypse of Esdras*, in which the prophet is anxious about the punishment of the wicked, and minutely describes them as tormented; the *Apocalypse of Paul*, giving a description of all that the apostle saw in heaven and hell; the *Apocalypse of John*, describing the future state, resurrection, judgment, punishment, and reward. This work was written as late as the 5th or 6th century. The *Apocalypse of Peter* is a history of events from the creation to the second advent of Christ, and is said to have been written by Clement, Peter's disciple. It is a late work, mentioning the crusades. Another late work is the *Revelations of Bartholomew*, in which Peter is made the archbishop of the universe, a fact that of itself gives the work a late origin. The *Apocalypse of Mary* described her descent into hell. The *Apocalypse of Daniel* is of little consequence. The *Discussion and Visions of Isaiah* assumes that the prophet had a vision of the life and crucifixion of Christ, the apostasy of the early churches, etc., for which prophecy Isaiah was condemned and died a martyr. The book was written about the 2d century. Other books of the kind are the *Shepherd of Hermas* and the *Testaments of the Twelve Patriarchs*. Many A. writings, both Jewish and Christian, mentioned in ancient works, are otherwise entirely unknown.

**APOCALYPTIC NUMBER** is "the mystical number" 666, spoken of in the book of Revelation (xiii. 18). As early as the 2d c., the church had found that the name Antichrist was indicated by the Greek characters expressive of this number; while others believed it to express a date. The most probable interpretation is that which was current in the days of Irenæus, and which found the number in the word *Latēinos* (*Latinus*). The Roman nation—the mightiest pagan power on earth—was the most terrible symbol of Antichrist, and the number 666 appears in the Greek characters which spell the name. Protestant controversialists very generally support their views by this interpretation, applying the prophecy to papal Rome.

**APOCARPOUS FRUITS**, in botany, are those fruits which are the produce of a single flower, and are formed of only one carpel, or of a number of carpels remaining free and separate from each other. The term is derived from the Greek *apo*, implying separation, and *carpos*, fruit.

**A POCO A POCO** (Ital.), in music, by degrees; by little and little.

**APOCRENIC ACID** is one of the products of the natural decay of wood and other plant textures, and is found wherever lignine or woody fiber is decomposing in soils, etc. As A. A. is soluble in water, it follows that rain-water falling on and percolating through soils containing this substance, becomes impregnated with it; and hence, in many natural waters, A. A. is a recognized constituent. A. A. performs an important function in the growth of plants, as there is every reason to believe that it forms one of the stages through which matter travels from dead plants again into the living vegetable tissue.

**APOCRYPHA**, or **APOCRYPHAL WRITINGS**. The word originally meant *secret* or *concealed*, and was rendered current by the Jews of Alexandria. In the earliest churches, it was applied with very different significations to a variety of writings. Sometimes it was given to those whose authorship and original form were unknown; sometimes to writings containing a hidden meaning; sometimes to those whose public use was not thought advisable. In this last signification, it has been customary, since the time of Jerome, to apply the term to a number of writings which the Septuagint had circulated amongst the Christians, and which were sometimes considered as an appendage to the Old Testament, and sometimes as a portion of it. The Greek church, at the council of Laodicea (360 A.D.), excluded them from the canon; the Latin church, on the other hand, always highly favored them; and finally the council of Trent (1545-63) placed them on an equality with the rest of the Old Testament. The church of England uses them in part for edification, but not for the "establishment of doctrine." All other Protestant churches in England and America reject their use in public worship. But it was once customary to bind up the A. between the authorized versions of the Old and New Testaments, though this has now ceased, and, as a consequence, this curious, interesting, and instructive part of Jewish literature is now known only to scholars. The Old Testament A. consists of 14 books: 1. First Esdras (q.v.); 2. Second Esdras (q.v.); 3. Tobit (q.v.); 4. Judith (q.v.); 5. The parts of Esther not found in Hebrew or Chaldee; 6. The Wisdom of Solomon; 7. The Wisdom of Jesus, son of Sirach, or Ecclesiasticus (q.v.); 8. Baruch (q.v.); 9. The Song of the Three Holy Children; 10. The History of Susanna; 11. The History of the Destruction of Bel and the Dragon (q.v.); 12. The Prayer of Manasses, King of Judah (see MANASSEH); 13. First Maccabees (q.v.); 14. Second Maccabees (q.v.). The precise origin of all of these writings cannot be ascertained. It is enough to state here that some bear traces of a Palestinian, others of an Egypto-Alexandrine, and others, again, of a Chaldaico-Persian origin or influence. Most, if not all, bear internal evidence of having been composed in the 1st and 2d c. B.C.

The A. of the New Testament may be arranged under three heads. 1. The writings comprising the *Apocryphal Gospels*, which consist of 23 separate documents, 10 in Greek and 12 in Latin. They concern themselves with the history of Joseph, and of the Virgin Mary before the birth of Christ, with the infancy of Christ, and with the history of Pilate. The most important of the set are the *Protocangelium of James*, the *Gospel of Thomas*, and the *Acts of Pilate*, which are perhaps the *origines* of all the apocryphal tra-

ditions. That many of the stories found in these were current in the 2d. c., is abundantly proved, but we have no evidence that any of the books known as Apocryphal gospels were then in existence, or are older than the 4th century. 2. The *Apocryphal Acts of the Apostles*, consisting of 13 documents originally written in Greek, but found also in a Latin compilation probably of the 6th century. They are distinguished from the Apocryphal gospels by having less of miracle and more of didactic discourse. The more important of the collection are *The Acts of Peter and Paul*, *The Acts of Barnabas*, *The Acts of Philip*, *The Acts of Andrew*, *The Acts of Bartholomew*, and *The Acts of John*. It is difficult to ascertain their age. Some are probably of earlier date than the Apocryphal gospels, but the original MSS. are lost, and we only possess them in late transcripts of the middle ages. 3. The *Apocryphal Apocalypses*, consisting of 7 documents, 4 of which are called apocalypses by their authors. There is great and perplexing variety in the MSS. That called *The Apocalypse of Moses* relates rather to the Old Testament than to the New; so does *The Apocalypse of Esdras*, which is a weak imitation of the fourth book of Esdras. The others are *The Apocalypse of Paul*, *The Apocalypse of John*, and *The Assumption of Mary* in three forms. These, too, only exist in late MSS. of the middle ages, and it is, of course, not quite certain that they are the same in form as the works bearing the same name referred to in the writings of the fathers.

The New Testament A. is not without interest or instruction for us. It throws a flood of light upon the workings of the early Christian consciousness and modes of thought, and it also enables us to appreciate the vast superiority of those Scriptures which have obtained canonical authority.—See Tischendorf's *Prolegomena* to the Apocryphal literature of the New Testament (Leipsic, 1873), and Clark's *Ante-Nicene Christian Library*, vol. 16 (Edinburgh, 1870).

**APOCYNACEÆ**, or APOCYNÆ, a natural order of dicotyledonous plants, consisting of trees and shrubs, generally with milky juice, having entire leaves, and no stipules. The calyx is usually 5-partite, persistent; the corolla hypogynous, monopetalous, often with scales in its throat, regular, 5-lobed, twisted in bud. There are five stamens, which are inserted on the corolla; the anthers adhere firmly to the stigma, to which the pollen is immediately applied; the anthers are 2-celled, and open longitudinally; the pollen is granular. The ovaries are two, each 1-celled, or one which is 2-celled; ovules usually numerous; styles 1 or 2; the stigma is contracted in the middle, and peculiarly characteristic of the order. The fruit is a follicle or capsule, or drupe or berry, double or single. The seeds have a fleshy or cartilaginous albumen, or (rarely) are ex-albuminous.—There are about 566 known species, chiefly natives of tropical countries. The PERIWINKLE (q.v.) is its only representative in the flora of Britain, a wanderer, as it were, from the tropics, yet hardy enough for the climate with which it has to contend; the OLEANDER (q.v.) and a few others are found in the s. of Europe. Many species are poisonous; amongst which is the noted Tanghin (q.v.) or TANGHEENA of Madagascar. Some are used in medicine, in India and other countries. A number of species yield Caoutchouc (q.v.). The milk of others is bland and wholesome, as the Hya Hya or Cow-tree (q.v.) of Demerara. Some are used in dyeing; *Wrightia tinctoria* yields indigo of good quality.—A number yield eatable fruits, as *Wilughbeia edulis* and *Carissa Carandas* in India; *Carissa edulis* in Arabia, and certain species of *Carpodinus*, called PSHAMIN in Sierra Leone, and *Hancornia*.—*Apocynum cannabinum*, Canadian hemp, a herbaceous plant about 4 to 5 ft. in height, with unbranched stem, oblong leaves, and lateral cymes of whitish bell-shaped flowers, yields a very strong fiber, which the Indians of North America employ for making twine, cloth, fishing-nets, etc.

**APODAL FISHES** are fishes destitute of ventral fins. In the Linnaean system, the *apodes* are an order of fishes, in which genera not otherwise nearly allied are brought together; but in the systems of Cuvier and other recent naturalists, a less important place is assigned to this distinctive character.—Eels are an example of A. fishes.

**APODICTIC**, a logical term signifying a judgment or conclusion which is necessarily true; or, in other words, a judgment of which the opposite is impossible. No A. judgment can be founded on experience, because experience does not supply the idea of an absolute necessity.

**APOGEE** (Gr. *apo*, from, and *ge*, the earth), properly speaking, the greatest distance of the earth from any of the heavenly bodies. Its application, however, is restricted to the sun and moon, the sun's A. corresponding to the earth's aphelion, and the moon's A. being the point of its orbit most remote from the earth. A. is opposed to peregée.

**APOLDA**, a t. of the grand duchy of Saxe-Weimar-Eisenach, Germany, on the Werlitz, a feeder of the Saale, 8 m. n.e. from Weimar. It is a station on the Thuringian railway, between Weimar and Weissenfels. It is a place of much industrial activity, having extensive manufactures of hosiery. Pop. '75, 12,427.

**APOLLINARIS**, the younger, bishop of Laodicea in Syria (362), and one of the warmest opponents of Arianism. Both as a man and a scholar, he was held in the greatest reverence; and his writings were extensively read in his own day. His father, A. the elder, who was presbyter of Laodicea, was b. at Alexandria, and taught grammar, first at Berytus, and afterwards at Laodicea. When Julian prohibited the Christians from teaching the classics, the father and son endeavored to supply the loss by converting the

Scriptures into a body of poetry, rhetoric, and philosophy. The Old Testament was selected as the subject for poetical compositions after the manner of Homer, Pindar, and the tragedians; whilst the New Testament formed the groundwork of dialogues in imitation of Plato. It is not ascertained what share the father had in this work, but as he had a reputation for poetry, he probably put the Old Testament into Greek verse. But it was chiefly as a controversial theologian, and as the founder of a sect, that A. is celebrated. He maintained the doctrine that the *logos*, or divine nature in Christ, took the place of the rational human soul or mind, and that the body of Christ was a spiritualized and glorified form of humanity. This doctrine was condemned by several synods, especially by the council of Constantinople (381), on the ground that it denied the true human nature of Christ. The heresy styled Apollinarianism spread itself rapidly in Syria and the neighboring countries, and, after the death of A., divided itself into two sects—the Vitalians, named after Vitalis, bishop of Antioch; and the Polemeans, who added to the doctrine of A. the assertion that the divine and human natures were so blended as one substance in Christ that his body was a proper object of adoration. On this account they were accused of *sarcolatria* (worship of the flesh) and *anthropolatria* (worship of man), and also were styled *synousiastoi* (*syn*, together, and *ousia*, substance), because they confused together the two distinct substances. The whole controversy, which occupied a great part of the 5th c., is an instance of human reason wandering out of its proper sphere. A. must not be confounded with Claudius A., bishop of Hierapolis, in Phrygia (170 A.D.), and who wrote an *Apology* for the Christian faith and several other works, all of which are lost.

**APOLLO** (Gr. APOLLON). A. may be regarded as the characteristic divinity of the Greeks, inasmuch as he was the impersonation of Greek life in its most beautiful and natural forms, and the ideal representative of the Grecian nation. His mild worship, with its many festivals, accompanied as they were by a cessation from all hostilities; his various shrines at sacred places, with their oracles, and the general idea of his character, had a wide, powerful, and beneficent influence on social and political life throughout the states of Greece. Homer and Hesiod mention that he was the son of Zeus and Leto, but neither states where he was born. The Ephesians believed that both he and Diana, his sister, were born in a grove near their city. The Tegyrians of Boeotia, and the inhabitants of Zoster in Attica, also claimed the honor of his birth; while the Egyptians seemed to think he properly belonged to them; but the most popular legend was that which made him a native of Delos, one of the Cyclades, where his mother Leto, followed by the jealous wrath of Juno over land and sea, at length found rest and shelter, and was delivered of him, under the shadow of an olive-tree, at the foot of Mt. Cynthus. To spite the queen of heaven, who was far from being a favorite with the other goddesses, these hastened to tender their services to the weak and wearied Leto. The young A. was much made of. Themis fed him with nectar and ambrosia, the food of the gods, which seems so have suddenly excited the conceit of the infant deity, inasmuch as he surprised his nurse by starting to his feet, demanding a lyre, and announcing his intention of henceforth revealing to mortals the will of Jove. The island, proud of having been the birth-place of A., adorned itself with a robe of golden flowers.

In ancient literature A. is described as possessed of many and various powers, all of which, however, are seen on closer inspection to be intimately related to each other. He is spoken of: 1. The god of retributive justice, who, armed with bow and arrows, sends down his glittering shafts upon insolent offenders. In this character he appears in the opening of the *Iliad*. 2. As the instructor of bards, and the god of song or minstrelsy, playing upon the phorminx or seven-stringed lyre, and singing for the diversion of the other deities when engaged in feasting. 3. As the god of prophetic inspiration, especially in his oracle at Delphi. 4. As the guardian deity of herds and flocks. 5. As the god of medicine, who affords help, and wards off evil. In this sense he is represented as the father of Asclepius (*Æsculapius*), the god of the healing art. 6. As a founder of cities. According to Homer, he assisted Neptune in building the walls of Troy. Cyrene, Naxos in Sicily, and other cities, venerated A. as their founder. By the later writers, A. was identified with Helios, the sun-god, though Homer describes the latter as a distinct deity. Several critics, however, have regarded Helios, or the sun-god, as the true original A.—an opinion which may be supported by many probabilities. The supposition that A. was identical with the Egyptian deity Horus was rejected by the learned O. Müller, who generally opposed all attempts to deduce Grecian from Egyptian mythology. According to Müller's theory, A. was a purely Doric deity, whose first residence was in Tempe, and who afterwards removed to Delphi, whence the fame of his oracle was spread abroad, and made him to be recognized as the national divinity of Greece. The introduction of his worship into Attica appears to have been contemporaneous with the immigration of the Ionians, and that worship would seem to have spread over the Peloponnesus, immediately after it was conquered by the Dorians. Much controversy has taken place, both with reference to the idea which lies at the root of the whole myth of the A. worship, and also as to whether this myth had its origin in the north of Greece or in Egypt. Even on the supposition that the original conception was derived from the latter source, it was to Greek art and philosophy that it owed its development into the ideal of humanity. The most celebrated oracles of A. were at Delphi, Abœ in Phocis, Ismenion in Thebes,

Delos, Claros, near Colophon, and Patara in Lycia. Among the Romans, the worship of A. was practiced as early as 430 B.C., and prevailed especially under the emperors. But there can be no doubt that the Romans derived their conceptions of A. entirely from the Greeks. It was in honor of A. and his sister Diana that the *ludi saeculares* were celebrated every hundred years. The attributes of A. are the bow and quiver, the cithara and plectrum, the snake, shepherd's crook, tripod, laurel, raven, etc.; less frequently, the grasshopper, cock, hawk, wolf, and olive-tree. In sculpture, he is generally represented with a face beautifully oval, high forehead, flowing hair, and slender figure.

**APOLLO BELVEDERE**, a celebrated statue of antiquity, which has generally been regarded as embodying the highest ideal of manly beauty. It is generally supposed to represent the "lord of the unerring bow" in the moment of his victory over the Python, but numerous other explanations have been suggested. The figure (upwards of 7 ft. in height) is naked, but a cloak fastened round the neck hangs gracefully over the extended left arm; the expression of the face is one of calm and godlike triumph, mixed with "beautiful disdain." This great work of art was discovered in 1503, amid the ruins of the ancient Antium, now Capo d'Anzo, and purchased by pope Julius II., who placed it in the Belvedere of the Vatican, whence the name it bears. The date of its execution is with probability referred to the reign of Nero, but the name of the artist is a matter of mere conjecture. The left hand and the right forearm, wanting in the statue as discovered, were restored by G. A. da Montorsoli, a pupil of Michael Angelo.

**APOLLODORUS**, an Athenian painter who flourished about 408 B.C., and was the predecessor of Zeuxis. He introduced improved coloring and distribution of light and shade.—A., a celebrated architect in the time of the emperor Trajan, by whom he was employed to construct a bridge over the Danube in lower Hungary. His severe censure, boldly pronounced on a design for a temple of Venus, which the emperor Hadrian had sent to him, caused A. to be sentenced to death in 129 A.D.—A., a Greek grammarian, lived about 140 B.C., studied philosophy in Athens, and grammar under Aristarchus; wrote a work on mythology, giving an arrangement of old myths from the earliest times to the historical period; also a geography, a chronicle in iambic verse, and several grammatical works. The mythology, which begins with the origin of the gods, probably went down as far as the Trojan cycle, but a portion of it has perished. It has been reckoned by some only an extract from a larger work by A., though this is a mere hypothesis, based on the fact that the legends are given with extreme simplicity and brevity. The work is one of great value to classical scholars. An edition of the *Bibliotheca* of A., in 4 vols., was published at Göttingen, 1782-3, by C. H. G. Heyne.

**APOLLO'NIA**, the name of several ancient cities: 1. In Illyria, on the Aous, founded by emigrants from Corinth and Corcyra, commercially prosperous, and toward the end of the Roman empire, a seat of literature and philosophy. 2. In Thracia (afterwards Sozopolis, and now Sizeboli), colonized by Milesians, and famous for a statue of Apollo, which was removed to Rome. 3. The port of Cyrene (afterwards Sorsusa, and now Marsa Sousse), which outgrew Cyrene itself, and left evidences of its magnificence in the ruins of its public buildings. This A. was the birthplace of Eratosthenes.

**APOLLONIUS**, the name of several celebrated Greek grammarians and rhetoricians. A., surnamed *Dyscolos* (or ill-tempered), of Alexandria, lived in the 2d century. Some of his grammatical works were edited by Bekker. A. was the first who reduced grammar to a system. His reputation was so high, that Priscian calls him *grammaticorum princeps* (the prince of grammarians).—A., son of Archebulus, also of Alexandria, lived in the time of Augustus, and was the author of a lexicon of Homeric words.—A., surnamed Molon, was a teacher of rhetoric at Rhodes, and also gave lectures at Rome, where he was highly esteemed by Cicero and Caesar.—A. OF PERGA, 240 B.C., is classed with Euclid, Archimedes, and Diophantus, as one of the founders of the mathematical sciences. His work on conic sections has been preserved, partly in the original Greek, partly in an Arabic translation. A. OF RHODES (or of Alexandria, say some authorities), b. 235 B.C., wrote many works on grammar, and an epic poem, entitled the *Argonautica*, marked rather by learning and industry than by poetical genius, though it contains some truly artistic passages, such as those exhibiting the growth of Medea's love. It was greatly admired by the Romans, was translated into Latin by Publius Terentius Varro, and was imitated, not only in a wholesale manner by Valerius Flaccus, but even by Virgil in some passages. It has been edited by the German scholars Brunck and Wellauer (Leipsic, 1813-28).

**APOLLONIUS**, OF TYANA, in Cappadocia, who lived in the time of Christ, was a zealous follower of the doctrines of Pythagoras. He soon collected a considerable number of disciples, traveled through a great part of Asia Minor, and endeavored to find his way to India, in order to become acquainted with the doctrine of the Brahmins. On this journey he stayed for a time in Babylon, was introduced to the Magi, and at last reached the court of king Phraortes, in India, who recommended him to Jarchas, the principal Brahmin. When A. returned from this pilgrimage, his fame as a wise man was greatly increased; the people regarded him as a worker of miracles and a divine being, and princes were glad to entertain him at their courts. He himself seems to have claimed insight into futurity, rather than the power of working miracles. From Rome

he was expelled on a charge of having raised a young woman from the dead. After extensive travels in Spain, Italy, Greece, and Ethiopia, he was accused of having taken part in an insurrection against Domitian; but appeared before the tribunal, and was acquitted. Ultimately, he appears to have settled in Ephesus, where he opened a Pythagorean school, and continued his teaching until he died, nearly 100 years old. His history was written about 100 years after his death by Philostratus (q.v.). It contains a mass of absurdities and fables, through which an outline of historical facts and the real character of the man are sufficiently discernible. Hierocles, a heathen statesman and opponent of Christianity, wrote, in the 3d c., a work on the life and doctrines of A., with a view to prove their superiority to the doctrine of Christ. In modern times, the notorious English freethinker Blount, and Voltaire in France, have renewed the attempt.

**APOLLO'NIUS**, of TYRE, the hero of a Greek romance, which enjoyed great popularity in the middle ages, and was translated into almost all the languages of western Europe. In it are related the romantic adventures which befell A., a Syrian prince, previous to his marriage with the daughter of king Alcistrates, of Cyrene. To these are added the adventures of his wife, who was parted from him by apparent death, as well as those of his daughter Tarsia, who was carried off by pirates, and sold in Mitylene. The poem closes with the reunion of the whole family. The original Greek work no longer exists; but there are three very early Latin versions, of which one was published by Weiser (Augsburg, 1595); another is to be found in the *Gesta Romanorum*; and the third in the *Pantheon* of Gottfried of Viterbo. From this Latin source have proceeded the Spanish version of the 13th c., printed in Sanchez's *Collecion de Poetas Castellanas* (2d edition, Paris, 1842), several French versions, in prose and verse, as well as several Italian. As early as the 11th c. there was an Anglo-Saxon adaptation of the work, and subsequently various English ones appeared. Shakespeare has treated the subject in his drama of *Pericles*; he substantially follows Gower, in his *Confessio Amantis*, who bases his narrative on the *Pantheon* of Gottfried of Viterbo. Three popular English stories, drawn from a French version of this romance, appeared in London in 1510, 1576, and 1607; while the Dutch, in 1493, derived theirs from the German. The romance was rendered into German, probably from the *Gesta Romanorum*, by a certain "Heinrich von der Neuenstadt" (i.e., Vienna), about the year 1300, in the form of a long and, as yet, unpublished poem. Later, we have a *Histori des Küniges Appolonii*, translated from Gottfried of Viterbo, and first published at Augsburg in 1476. Simrock, in his *Sources of Shakespeare*, narrates the story as it is given in the *Gesta Romanorum*. A modern Greek translation of the Latin romance, undertaken in 1500 by Gabriel Contianus of Crete, and several times reprinted at Venice, must not be confounded with the lost Greek original.

**APOL'LOS**, a learned Jew from Alexandria, who came to Ephesus during the absence of St. Paul and preached the doctrine of Christ. At Corinth he taught the Jews from their scriptures that Jesus was the Christ. There was a division in the church at Corinth, and one of the parties took his name, but without his authority, for he was always friendly with St. Paul and preached the doctrines of the apostles. An uncertain tradition makes him bishop of Cæsarea. Luther's conjecture that A. was the author of the epistle to the Hebrews, favored by some scholars of eminence, remains without proof.

**APOL'LYON**, used (Rev. ix. 11) to translate the Hebrew *Abaddon*, which means "destruction," and thence, the place of the dead; perhaps nearly equivalent to Hades with the Greeks. A. is personified as the angel having dominion over the bottomless pit; as a destroying power, appearing in the forms of beasts at the sound of the fifth trumpet. In the *Pilgrim's Progress* A. is the evil spirit encountering Christian in the valley of the shadow of death.

**AP'OLOGUE**, a fable, parable, or short story, intended to serve as a pleasant vehicle of some moral doctrine. One of the oldest and best apologies or parables is that by Jotham, as given in the book of Judges (ix. 7-15). Another celebrated A. is that of the "limbs and the body," related by the patrician Menenius Agrippa. Æsop's fables have enjoyed a world-wide reputation. Luther held such an opinion of the value of the A. as a vehicle of moral truth, that he edited a revised Æsop, for which he wrote a characteristic preface. He says: "In doing this, I have especially cared for young people, that they may receive instruction in a style suitable to their age, which is naturally fond of all kinds of fiction; and I have wished to gratify this natural taste without indulging anything that is bad."

**APOL'OGY**. The term is now commonly understood as synonymous with an excuse for breach of an engagement, etc., but was originally used as the title of any work written in defense of certain doctrines, as in the *A. of Socrates*, ascribed to Plato and Xenophon; the *A. for the Christians*, by Tertullian, and in many other defenses of the Christians, written by Justin Martyr, Athenagoras, Tatian, Theophilus, Origen, Eusebius, Minucius Felix, Arnobius, Lactantius, Augustine, Orosius, and others. The attacks parried or retorted in these apologetical works are such as charges of atheism, want of philosophical knowledge, anti-social tenets, etc. Both the charges and the refutations brought forward serve to give us an insight into the character of the times when these

works were written. Thus, in the A. by Tertullian, it is curious to find a formal argument employed to refute the assertion that the spread of Christianity was the cause of "earthquakes" and other natural phenomena which had occurred in some parts of the Roman empire. After the 4th c., when the church was made dominant under the Roman emperors, apologetical writings were less called for; but Bartholus Edessenus and Raymundus Martinus wrote against the Jews and the Mohammedans. In the 15th c., when the revival of learning placed Christianity in apparent opposition to the Platonic philosophy, Marsilius Ficinus wrote in defense of revelation; and, some time after the reformation, the spread of freethinking and skepticism in England was opposed by a variety of apologetical works, chiefly maintaining the points that Christianity is a divine revelation, Christ a divine messenger, and his church a divine institution. The defense of Christianity on grounds of reason came now to be treated as a distinct branch of theology, under the name of *Apologetics*. Among the numerous apologetic works by Protestants, may be mentioned those by Grotius (*De Veritate*, etc.), Butler (*Analogy of Religion, Natural and Revealed*), Lardner (*Credibility of the Gospel History*), Leland, Addison, Soame Jenyns (*Internal Evidences of the Christian Religion*), Hugh Farmer, Bishop Watson (*A. for Christianity*), Paley (*Evidences of Christianity*, and *Horæ Paulinæ*), etc. Among Roman Catholic apologetic writers, the most eminent are Pascal, Houtteville, Guenée, Bergier, Mayr, and Chateaubriand.

Recently, a great number of apologetic works by Neander, Tholuck, and others have appeared, in reply to Strauss's *Life of Jesus*, and the *Vie de Jésus* by Joseph Ernest Renan.

**APONEUROSIS** is an anatomical term for an expansion of strong fibrous tissue, of which there are many examples in the human body. For the sake of convenience, it is generally confined to expansions from the tendons of muscles, as the lumbar A. If a tendon is very broad and expanded, as that of the external oblique muscle of the abdomen, it is said to be aponeurotic. Some muscles, as those on the shoulder-blade, are partially covered with a tendinous expansion, to which some of their fibers are attached; this is termed the aponeurotic *origin* of the muscle; it gives the muscle a more extensive attachment, without adding materially to weight. Aponeuroses stretch in some localities as protections over large arteries; thus, in bleeding from the vein nearest the inside of the bend of the elbow, the only structure between it, the lancet, and the brachial artery, is an aponeurotic expansion from the biceps tendon into the muscles of the fore-arm. See *FASCIA*.

**APOPHTHEGM** (Gr., an utterance), a term used to designate any truth or maxim sentimentiously expressed. The oracles of the heathen gods often took this form, as also the proverbs, memorable sayings, etc., of the sages of antiquity. In modern times, lord Bacon has made a charming collection of apophthegms.

**APOPLEXY** is a term applied to an engorgement of blood, with or without extravasation, in or upon any organ, as the brain (*cerebral A.*), the spinal cord or lungs (*pulmonary A.*). As popularly used, the term denotes vaguely a condition arising from some disturbance within the head. A. occurs in *fits*, which may be sudden or come on by degrees. They are characterized by loss of sense and motion, speechlessness, and heavy sleep, with stertorous respiration and a slow pulse. The fit may last from a few hours to two or three days, and passes off, leaving generally more or less paralysis, and recurs at intervals of months or years. The *age* at which A. occurs most commonly is from 50 to 70, and is comparatively rare before and after these ages. Cerebral A. may arise from mere congestion of the blood-vessels of the brain, caused by impeded return of the venous blood, as from the military stock pressing on the jugular veins, keeping the head long in one position, or turning it quickly. Stout persons, with short necks, are more liable to this form of A., though lean persons are also frequently its victims. But, in addition to congestion, there may be an escape of the watery portion of the blood from the congested vessels, and, this collecting, produces *serous A.*; or, owing to a diseased condition of the arterial walls, the vessels may burst, and A. from cerebral hemorrhage be the result; the latter is the most common, and is usually preceded by some softening of the brain substance itself. If this bleeding be to any great extent, death results; if only a small quantity escapes, it coagulates, and forms a clot, which is absorbed in time. Persons with diseased heart and lungs, and pregnant females, are liable to apoplectic fits. The attack is generally preceded by vertigo, headache, partial or temporary loss of memory, and occasionally double vision. When these warnings occur, medical advice should be sought to correct the digestive functions; and, by relieving the oppressed brain, ward off the fit. When the latter occurs, the patient's head should be raised, cold applied, and in some cases blood should be withdrawn from the temporal artery or external jugular vein. As soon as possible, purgative medicines should be administered. For the results of A., see *PARALYSIS*. Tumors within the skull produce symptoms of A.

**APOSTATE** literally designates any one who changes his religion, whatever may be his motive; but, by custom, the word is always used in an injurious sense, as equivalent to renegade, or one who, in changing his creed, is actuated by unworthy motives. In early Christian times, the word was applied to those who abandoned their faith in order to escape from persecution; but it was also applied to such as rejected Christianity on

speculative grounds (the emperor Julian, for instance). After the 5th c., when heathenism was declining, many who had no sincere belief in Christianity, yet made profession of it, and were baptized; these also were styled apostates. The apostates in times of persecution were styled variously *Sacrificati*, *Thurificati*, etc., according to the modes in which they publicly made known their return to heathenism, by offering sacrifices or incense to the gods of Rome. The Roman Catholic church at one period imposed severe penalties on apostasy. The apostate was, of course, excommunicated; but sometimes, also, his property was confiscated, and he himself banished, or even put to death. It has often been of great moment to the fortunes of a nation that a prince has apostatized. The most renowned instance in modern history is that of Henry IV. of France. In 1833 there was published, at Erlangen, *A Gallery of Important Persons who, in the 16th, 17th, and 18th Centuries went over from the Protestant to the Roman Catholic Church*. The term *APOSTASY* is now employed commonly, and often abusively, as a reproach for great or sudden changes in political opinions.

A POSTERIORI. See A PRIORI, *ante*.

**APOSTLE** (Gr. *apostolos*, sent forth, sent on a mission), any messenger whatever, but especially used to denote the twelve disciples whom Jesus sent forth to preach the gospel. Their names were Simon Peter, Andrew, John (the son of Zebedee), James (his brother), Philip, Bartholomew (called also Nathaniel), Thomas, Matthew (surnamed Levi), James (the son of Alphaeus), Thaddeus, Simon, and Judas Iscariot. Subsequently Matthias was chosen in the room of Judas; and at a still later period the number of the apostles was further increased by the calling of Paul to the apostleship. The term is sometimes used in the New Testament in its more general signification. Barnabas is styled an A. (Acts xiv.). It is a point of controversy between the supporters and opponents of episcopacy, whether or not the term A., as indicating an office, is applied to any except the original twelve, Matthias and Paul; it being maintained, on the one hand, that the office is perpetuated in bishops; on the other, that it was temporary and belonged exclusively to those who were witnesses of the resurrection of Christ, and were employed by him to found the Christian church. The apostles were twice commissioned by their Master to go forth on their work of evangelization. First, during the third year of his public ministry. On this occasion their labors were to be restricted to the Jews, properly so called. Not even the Samaritans, though natives of Palestine, were to be the objects of their religious solicitude. They were earnestly to seek out the lost sheep of the house of Israel. The second time was shortly before the Lord's ascension, when their sphere of labor was indefinitely extended. "Go, and teach all nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost." On the day of Pentecost, the apostles received miraculous gifts fitting them for their arduous work. And after evangelizing for some years in Palestine, they all departed, with the exception of St. James, into various quarters of the globe; but the region of their ministry seems to have principally comprised the civilized provinces and cities of the eastern part of the Roman empire—viz., Syria, Asia Minor, and Greece; though probably Peter, and after him Paul, visited Rome. There is no historical foundation for the tradition that the first apostles divided the then known world into twelve parts, each taking one of these for his special sphere of labor. This figment was very likely originated by two circumstances: 1. That the disciples were commanded to go into all the world and preach the gospel; and 2. That the disciples in point of fact had little personal intercourse with each other. Their zeal for the propagation of Christianity left them no time to gratify their social inclinations. As a consequence, we have very imperfect accounts of their lives or manner of death.

The several apostles are usually represented in medieval pictures with special badges or attributes: St. Peter, with the keys; St. Paul, with a sword; St. Andrew, with a cross; St. James the less, with a fuller's pole; St. John, with a cup and a winged serpent flying out of it; St. Bartholomew, with a knife; St. Philip, with a long staff, whose upper end is formed into a cross; St. Thomas, with a lance; St. Matthew, with a hatchet; St. Matthias, with a battle-axe; St. James the greater, with a pilgrim's staff and a gourd-bottle; St. Simon, with a saw; and St. Jude, with a club.

APOSTLES' CREED. See CREED.

**APOSTLES' ISLANDS**, or **THE TWELVE APOSTLES**, in lake Superior, near the w. end; belonging to Wisconsin. There are more than twice the number of islands, having in all 125,000 acres. On Madeline island is La Pointe; pop. '70, 221. These islands were occupied by the French missions as early as 1658.

**APOSTOLIC**, or **APOSTOLICAL**, the general term applied to everything derived directly from, or bearing the character of the apostles. Either case constitutes apostolicity. The Roman Catholic Church declares itself the A. church; the papal chair the A. chair, on the ground of an unbroken series of Roman bishops, from the chief apostle, Peter. The church of England, in virtue of regular episcopal ordination from the pre-reformation church, claims to be A.; so likewise do the Protestant Episcopal churches in Scotland and the United States. Apostolic tradition (see TRADITION) claims to have been handed down from the apostles. In the same special sense, the name of A. council belongs to that conclave of the apostles at Jerusalem (Acts xv.), about the year 51 or 52 A.D., occa-

sioned by the disputes raised at Antioch by Judaizing Christians as to the admission of uncircumcised Gentiles into the church. Certain congregations or churches, also, which were the special scenes of the labors of the apostles, bore for centuries the title of A. churches, more especially those of Jerusalem, Antioch, Ephesus, Corinth, and Rome. But with the ever-increasing spiritual power of the Romish hierarchy, the name A. came to be more and more exclusively applied to Rome, and is retained by her, despite the energetic protests of the Protestant churches. Hence the term apostolic see, i.e., the see of Rome; apostolic blessing, the blessing of the pope as the successor of St. Peter; apostolic vicar, the cardinal who represents the pope in extraordinary sissions; apostolic chamber, a council intrusted with the care of the revenues of theme of Rome; apostolic months—Jan., March, May, July, Sept., Nov.—the months in which the pope, according to the Vienna Concordat of 1448, took possession of the vacant benefices in Germany, etc. A papal brief or letter is styled A. in the same sense.

**APOSTOLIC BRETHREN**, or **APOSTOLICI**, the name given in Italy, towards the end of the 13th c., to one of those sects which, animated by the spirit of an Arnold of Brescia, felt constrained to oppose the worldly tendencies of the church. Its founder was Gerhard Segarelli, a weaver in Parma. Rejected, from some cause or other, by the Franciscan order, his long-continued and enthusiastic meditations led him to the profound conviction that it was above all things necessary to return to the simple forms of apostolic life. Accordingly, he went about (1260) in the garb of the apostles, as a preacher of repentance, and by his practical discourses gathered many adherents into a kind of free society, bound by no oaths. At first he managed to avoid any direct collision with the dogmas of the church; but after twenty years of undisturbed activity and growing influence, Segarelli was arrested by the bishop of Parma; and in 1286, upon the occasion of his release, pope Honorius IV. renewed a decree of pope Gregory X. against all religious communities not directly sanctioned by the papal chair. In 1290, Nicholas IV. setting himself to expose the A. B., they, on their side, began avowedly to denounce the papacy, and its corrupt and worldly church, as the Babylon of the Apocalypse. In 1300, many, both men and women, and among them Segarelli, as having, after abjuration, relapsed into heresy, perished at the stake. But his cause survived him. Dolcino, a more energetic and cultivated man, brought up as a priest, who had previously taken an active part in the Tyrol against the corruptions of the church, now headed the orphan sect in Italy. He taught the duty of a complete renunciation of all worldly ties, of property and settled abode, etc. Having retreated into Dalmatia, he announced from thence the dawning of the new era, and in 1304 reappeared in upper Italy, with thousands of adherents, as the enemy of the papacy—at that time humbled and impoverished by France. In 1305, a crusade was preached against him. He fortified the mountain Zebello, in the diocese of Vercelli, but was, after a gallant defense, compelled by famine to submit. After horrible tortures, which he bore with the utmost fortitude, he was burned. In Lombardy and the south of France, remnants of the A. B. lingered on till 1368. See Krone, *Fra Dolcino und die Patarerer*. (Leipsic, 1844.)

**APOSTOLIC CATHOLICS**. See **IRVINGITES**.

**APOSTOLIC FATHERS**, the name given to the immediate disciples and fellow-laborers of the apostles, and, in a more restricted sense, to those among them who have left writings behind them. The A. F., specially so called, are Barnabas, Clement of Rome, Ignatius of Antioch, and Polycarp of Smyrna. It is uncertain whether Papias of Hierapolis, and the author of the *Shepherd*, were really disciples of the apostles. The writings of the A. F., as to their form and subject, may be looked upon as a continuation of the apostolic epistles, though far inferior to them in spirit. Their main purpose is to exhort to faith and holiness before Christ's coming again.—Editions of the A. F. were published by Cotelerius (Par., 1672), Jacobson (Oxford, 1838), Hefele (1839), and Dressel (1857); another by Zahn, Gebhardt, and others began to appear in 1875. There are several English translations, including one in Dr. Donaldson's *Ante Nicene Library*, vol. i. (1867).

**APOSTOLIC MAJESTY**, a title held by the kings of Hungary, was conferred by pope Sylvester II. in 1000 A.D., upon duke Stephen of Hungary, who had not only much encouraged the progress of Christianity in Hungary, but actually preached himself, in imitation of the apostles. In 1758, the title was renewed by pope Clement XIII., in favor of Maria Theresa as queen of Hungary, and continues to be used by the emperor of Austria as king of Hungary.

**APOSTOLIC CANONS** and **CONSTITUTIONS**, both ascribed by tradition to Clemens Romanus, are notes of ecclesiastical customs held to be apostolical, written in the form of apostolic precepts. The *Constitutiones Apostolicæ*, consisting of eight books, were probably composed in Syria, and contain, in the first six books, a comprehensive rule for the whole of the Christian life. These were probably written about the end of the 3d c.; while the seventh book, which is essentially an abridgment of them, may have belonged to the beginning of the 4th century. The eighth book was put together in the middle of the 4th c., for the use of the priests, and only relates to the sacred offices. Interpolations, however, were afterwards introduced. The *Canones Apostolici*, which were also recognized by the church, were composed at a later period. The first fifty, compiled in the

middle of the 5th c., and translated from Greek into Latin by Dionysius the younger, were acknowledged by the Latin church alone. The Greek church, on the other hand, accepted the 33 canons put forth in the beginning of the 6th c.; and this became a point of discord between the churches. Both collections were probably looked upon at first as apostolic traditions merely. Later, it came to be believed that they were written down by the apostles themselves, it being thought probable that they should have expressed themselves positively about the constitution as well as the dogmas of the church.

**APOSTOLIC PARTY**, the name given to a party who acted a conspicuous part in the modern history of Spain. They were composed of fanatical Catholics, who were also absolutists so far as the king consented to be their instrument. They formed themselves (soon after the revolution of 1819) into an A. P., whose leaders were fugitive priests, and whose troops were smugglers and robbers. After taking an active part in all the subsequent agitations, they finally merged (1830) in the Carlist party.

**APOSTOLICAL SUCCESSION** is a phrase used to denote one or both of *two* things—the derivation of holy orders by an unbroken chain of transmission from the apostles, and the succession of a ministry so ordained to the powers and privileges of the apostles. The former is necessarily a matter of fact, to be ascertained by history; the latter is rather a matter of opinion—the Roman and Protestant churches, and again individuals and parties in either, differing widely from each other in their views. See **BISHOP** and **ORDINATION**.

**APOS TROPHE** (Gr. *apostrophē*, a turning away, or breaking off) is a rhetorical figure by which a speaker changes the course of his speech, and addresses, with greater or lesser emotional emphasis, persons present or absent, the dead, or inanimate objects, either to invoke them as witnesses, or to pity, praise, or blame them. When the figure is well managed, it has a thrilling effect, both in oratory and poetry; but when extravagantly introduced, it becomes ludicrous. Examples of it abound in the writings and speeches of the great poets and statesmen both of ancient and modern times.—A. in grammar is the omission of a letter or letters in a word, the omission being marked by a comma, as *'tis for it is*; the comma so employed is also called an A.

**APOTHECARY**, the name formerly given in England and Ireland to members of an inferior branch of the medical profession. The A. was in England a licentiate of the apothecaries' society of London; in Ireland, a licentiate of the apothecaries' hall of Ireland. Up to a comparatively recent period, however, no inconsiderable proportion of those who practiced as apothecaries, at any rate in England, were persons practicing without any license. The A. frequently kept a shop in which he sold drugs and made up medical prescriptions, in this respect competing with the chemist and druggist. But he was entitled to attend sick persons, and prescribe for them; and though it was the almost universal practice of apothecaries to charge their patients only for the medicines supplied, they had the choice between doing this and charging for their attendances. They could not charge for both. This was held by chief-justice Best, in an action by an A., who sought to recover on both grounds (see Wilcock, *On the Medical Profession*).

In having this choice as to their mode of charging, they had the advantage of the chemists and druggists; but the chief advantage they had over these lay in the recognition, by the law, of their right to practice, and their consequent immunity from punishment for the results of malpractice, except where they had shown gross ignorance. The medical act of 1858, which greatly altered the conditions of medical practice throughout the united kingdom, has much improved the status of licentiates of the apothecaries' societies; and though such licentiates are still entitled to keep shops for the sale of drugs, and to make up their own prescriptions, the passing of the pharmacy act (1868) has made broader the distinction between them and the class of chemists and druggists (see **CHEMISTS AND DRUGGISTS**). The term A. has been long in disuse, though, no doubt, it is still a legal description for licentiates of the apothecaries' society of London, or of the apothecaries' hall of Ireland; and such licentiates are now, as licentiates in medicine before the law, in all respects, including eligibility for public appointments, on a par with the graduates of universities. Under the medical act of 1858, they are entitled to be registered as licentiates in medicine, and, when registered, they have the right of practicing medicine in all parts of the queen's dominions, charging both for their visits and professional advice, and for medicines or medical appliances supplied by them. It is possible, indeed, that they have one advantage over medical men practicing on other qualifications; for it has been repeatedly held by county court judges in England that they are the only medical practitioners entitled to recover the price of medicines supplied to patients. But this question has never been brought before the superior courts in England, and the decisions referred to seem not to be supported by the language of the medical act. The conditions of getting the licenses of the apothecaries' society and of the apothecaries' hall in Ireland are nearly the same as those imposed by other corporations which grant medical qualifications, the only difference worth mentioning being that an apprenticeship to a licentiate for five years in England, for three years in Ireland, is indispensable for the apothecaries' license. The requirement of an apprenticeship put the apothecaries' society and the apothecaries' hall of Ireland at a disadvantage compared with the colleges of physicians which grant licenses to practice medicine; it also made it impossible for them to combine with surgical corporations in giving the

double qualification in medicine and surgery on the result of a conjoint examination. Accordingly, the act 37 and 38 Vict. c. 34, s. 2, in 1874 made the requirement of apprenticeship unnecessary. The apothecaries' society of London and the apothecaries' hall of Ireland each appoint a member of the general council of medical education and registration. The former is the first licensing corporation in the united kingdom which granted a license to a woman to practice medicine; and the act of 1874, which has been above referred to, saved their rights to admit women to certain examinations.

In England, the business or profession of an A., although not regulated, nor, indeed, fully recognized, till modern times, was the subject of several ancient statutes, and is traceable to a remote period. Richard Fitznigel, who died bishop of London, is stated to have been A. to Henry II.; and it is an accredited tradition that in 1345 king Edward III. gave a pension of sixpence a day to Coursus de Gangland, an A. in London, for taking care of and attending his majesty during his illness in Scotland. It is, however, improbable that apothecaries were then common; indeed, it may be doubted whether at that time they existed as a publicly known body at all, for, in 1511, there was passed an act of parliament, the 3 Henry VIII. c. 11, for regulating the admission of persons practicing physic or surgery, which makes no mention of the class now known as apothecaries. In 1543, however, the parliament passed a very curious act, the 34 and 35 Henry VIII. c. 8, the preamble of which deals severely with the ignorance and cupidity of the London surgeons; and which, as a remedy, provides for the toleration and protection of the irregular practitioners, who afterwards, as a body, acquired the distinctive name of apothecaries. This act, strange though it be in its language, may perhaps be regarded as the real foundation of the office of the A. It certainly shows on its face sufficient cause for its recognition of the persons to benefit whom it was passed, for it complains that the surgeons of London were not only unskillful and grasping, but that they "have sued, troubled, and vexed divers honest persons, as well men as women, whom God had endued with the knowledge of the nature, kind, and operation of certain herbs, roots, and waters, and the using and ministering of them to such as had been pained with customable diseases, as women's breasts being sore, a pin and the web in the eye, uncomes of hands, burnings, scaldings, sore mouths, the stone, strangury, saucelin, and morphew, and such other like diseases; and yet the said persons have not taken anything for their pains or cunning, but have ministered the same to poor people only for neighborhood and God's sake, and of pity and charity." The act, therefore, proceeds to ordain, "That at all time from henceforth it shall be lawful to every person being the king's subject, having knowledge and experience of the nature of herbs, roots, and waters, or of the operation of the same, by speculation or practice, within any part of the realm of England, or within any other the king's dominions, to practice, use, and minister in and to any outward sore, uncome, wound, apostemation, outward swelling or disease, any herb or herbs, ointments, baths, pultess, and emplaisters, according to their cunning, experience, and knowledge in any of the diseases, sores, and maladies before said, and all other like to the same, or drinks for the stone, strangury, or agues, without suit, vexation, trouble, penalty, or loss of their goods, the foresaid statute in the foresaid third year of the king's most gracious reign, or any other act, ordinance, or statute to the contrary heretofore made in anywise notwithstanding."

Anciently, the apothecaries were not distinguishable from the grocers (the surgeons being, in like manner, undistinguishable from the barbers); indeed, it rather appears that apothecaries and grocers were synonymous terms; and it was not till 1617, in the 13th year of James I., that these bodies were formed into two distinct corporations by a charter from the king, which, reciting a previous grant to the grocers in 1606, by which the two bodies were expressly united, declares that the apothecaries shall, thenceforward, be separate from and constitute a company distinct from the grocers. The privileges conferred by this charter upon the apothecaries were afterwards considerably enlarged by an act of parliament, 55 Geo. III. c. 194, to which we shall presently refer. But even after the charter of James, the London apothecaries appear to have been regarded merely as a trading company, occasionally prescribing the medicines which they sold, thus trespassing, as it was thought, on the province of the physician, until their right to do so was supported by a judgment of the house of lords, in the case of the college of physicians against Rose, reversing a previous decision of the court of king's bench. Rose, who was an A. and freeman of London, had attended one Seale, a butcher, and made up and administered what was not denied to be proper medicine to him. This, it was contended, on behalf of the physicians, was an infringement of their exclusive privileges, and the king's bench being of the same opinion, unanimously gave judgment for the plaintiffs; but the judgment was reversed by the house of lords. So generally established had this branch of the medical profession become, that, in 1815, the act of parliament, 55 Geo. III. c. 194, to which we have already referred, was passed to provide for the sufficiency of their education; thus, for the first time, as it may be said, placing the apothecaries, as a body, on the footing of a liberal profession. This statute, which completely regulates the position, privileges, and responsibilities of the apothecaries, after reciting (and for the most part confirming) the charter of James I., by which the apothecaries of London had been distinctively incorporated as a company, proceeds to enact that no person shall practice as an A., or act as an assistant to an A., in any part of England or Wales, unless he shall have been examined by a court of examiners (to be chosen

by the master and wardens of the said company, in such manner as the act directs), and have received therefrom a certificate of his being duly qualified to practice as such. And with respect to what constitutes such practice as an A., it has been judicially determined that courts of law will look to section 5 of the act, which defines certain of the duties and liabilities of the office, but which in no way deprives apothecaries of any of their previously acquired privileges. The certificate—for which a sum is to be paid for the benefit of the company's funds—is not to be granted to any person below the age of twenty-one, though he needs now no apprenticeship of five years to an A., or who cannot produce testimonials of sufficient medical education and good moral conduct; and any person practicing without such certificate, is disabled from recovering his charges, and for every such offense is, moreover, liable to a penalty of £20, which can be recovered in the county court. It is also provided that—inasmuch as it is the duty of every A. to prepare, with exactness, such medicines that may be directed for the sick by any physician lawfully licensed—any A. refusing to compound or sell, or negligently compounding or selling any medicines as directed by any prescription or order, signed by any physician, lawfully licensed, with his initials, shall incur such penalties and forfeitures as therein set forth. And further, that the master, wardens, and society of apothecaries for the time being, or any persons by them appointed, and being not fewer than two, and properly qualified, may at all reasonable times in the daytime enter the shops of any A. throughout England and Wales, and search and examine whether the medicines and drugs be wholesome, and meet for the health of the subjects of the realm, and destroy such as they find to be otherwise; and report to the master and wardens of the society the names of the offenders, who are made liable to a fine of £5 for the first, £10 for the second, and £20 for the third offense. The act contains, however, a proviso that nothing therein shall affect the business of a chemist and druggist in the buying, preparing, compounding, dispensing, and vending drugs, medicines, and medicinal compounds, wholesale and retail; nor interfere with the rights of the universities of Cambridge or Oxford, the college of physicians or of surgeons, or the society of apothecaries, respectively, except as altered by that act.

This act, which was passed on the 12th of July, 1815, provides for the exemption from its operation of such apothecaries as might have been in practice on or before the first day of Aug. of that year, and was amended by an act of 1874, chap. 34.

The apothecaries in Ireland are an exclusive corporation, whose privileges, equally with those of the apothecaries' company of London, are expressly saved by the medical act of 1858 (the 21 and 22 Vict. c. 90). Although occupying a position corresponding in many respects to that of the same body in England previous to 1858, the Irish apothecaries do not appear to have established their rights as medical practitioners to the extent to which the English apothecaries have succeeded.

The law relating to apothecaries in Ireland is contained in an act of the Irish parliament, the 31 Geo. III. c. 34, passed in 1791, which enacted that none should practice the art and mystery of an apothecary until after examination and certificate from the apothecaries hall in Dublin. A great deficiency had long existed in Ireland of establishments and shops for the sale of medicines and compounding of prescriptions. It thus became necessary to form a pharmaceutical society in Ireland, and provide for the examination and registration of persons having competent practical knowledge of pharmaceutical and general chemistry. In 1875, an act called the pharmacy act (Ireland), 1875, 38 and 39 Vict. c. 57, was passed, creating the pharmaceutical society of Ireland as a body corporate with a first council, and defining qualifications for their successors. By that act all future duly examined persons, and all the existing licentiates of apothecaries' hall, were entitled to be registered as pharmaceutical chemists. So much of the act 1791 as prohibited keeping of open shop by others than licentiates was repealed; but it is unlawful for any person to sell or keep open shop for retailing, dispensing, or compounding poisons within the act 33 and 34 Vict. c. 26, or medical prescriptions, unless registered as a pharmaceutical chemist, or a chemist and druggist, under this act of 1875, or to assume such names unless registered. Unqualified persons incur a penalty of £5; but licentiates of the apothecaries' hall, and others who have passed an examination in pharmacy, are excepted. Registration under the act 1875 does not entitle to practice medicine or surgery. See CHEMISTS AND DRUGGISTS.

In Scotland, there never was a class of practitioners corresponding to the English apothecaries.

#### APOTHECIA. See LICHENS.

**APOTHEOSIS**, deification, or the raising of a mortal to the rank of a god (Gr. *theos*). From the polytheistic point of view there is nothing monstrous in this idea; on the contrary, it is quite natural, and a necessary part of the system. Among heathens generally, and especially among the Romans, every departed spirit became a deity (see MANES); "and as it was common for children to worship (privately) the manes of their fathers, so was it natural for divine honors to be publicly paid to a deceased emperor, who was regarded as the parent of his country." (See SMITH'S *Dictionary of Greek and Roman Antiquities*.) At the *Consecratio*, as it was called, of a Roman emperor, the body was burnt on a funeral pile, and as the fire ascended, an eagle was let loose to mount into the sky, carrying, as was believed, the soul of the emperor from earth to heaven. Many

medals are found with the word *consecratio* surrounding an altar, with fire on it, and an eagle rising into the air.

**APPALACH'EE BAY**, a portion of the gulf of Mexico near the n. part of Florida, extending about 50 m. inland. It receives the waters of St. Mark's, and several smaller rivers, and has a narrow n.w. arm called Okalonee bay.

**APPALACH'EES**, a tribe of Indians, of the Choctaw family, in Florida, on A. bay. They were friendly with the Spaniards until white oppression provoked a revolt in 1687, when they were quickly subdued. Soon afterwards, the English and their Indian allies fell upon the A. and killed or carried off many of them. In 1704, St. Mark's was taken and the missionaries put to death. The A. disappeared as a tribe of any importance after 1722.

**APPALACHI'ANS**, the general appellation of the great mountain-system—called also the Alleghanies—which stretches from the interior of Maine to the borders of Alabama, its distance from the sea gradually ranging between about 100 m. in the n. and about 300 in the s. Speaking generally, this chain may be regarded as the parent of the Atlantic rivers of the United States on the one side, and on the other of the southern tributaries of the St. Lawrence, and of the eastern feeders of the Mississippi: it is not, however, the actual water-shed during its entire length, for it is crossed by the Connecticut, the Hudson, and the Delaware, just as the Himalayas are pierced by the Ganges, and the Andes by the Amazon. The chain, in fact, consists of several ranges generally parallel to each other, which, along with the intermediate valleys that occupy two thirds of the breadth, form a belt 100 m. wide—its multiform character, however, developing itself only to the w. and s. of the Hudson. To take the chief ridges by name, and to begin from the n.: the white hills of New Hampshire present some of the loftiest elevations, Moosehillock and Washington being respectively 4636 and 6634 ft. above the sea. Next in order, the Green mountains, which, true to the name, almost cover Vermont, attain, in Killington Peak, a height of 3924 ft.; then come the Highlands, on the e. of the Hudson, so striking an object to the voyagers on its waters; immediately beyond that river, again, we find the Catskill mountains, which, though of inconsiderable length, contain two eminences—Round Top and High Peak—respectively of 3804 and 3718 ft.; while, on a terrace of another member of the group, Mountain House, a favorite refuge from the heats of summer, is perched 2500 ft. above the level of the Hudson. Proceeding onwards, the Kittatinnies extend from the n. of New Jersey as far as Virginia; while nearer to the sea, the Blue Ridge, stretching from about the same parallel down to North Carolina, is crowned, within the limits of Virginia, by the peaks of Otter, 4000 ft. high. In North Carolina are the Black mountains, with the highest summit of the system, Black Dome, 6760 ft. in height. Lastly, there lie, more to the westward, the Alleghanies proper in Pennsylvania and Virginia, and the Cumberland mountains on the e. border of Kentucky and Tennessee.

Of all these elevations not one at all approaches the limit of perpetual snow. Yet France, while struggling with England in North America, regarded the A. as a wall that was physically to exclude her rival from the basins of the St. Lawrence and the Mississippi. Anglo-Saxon energy, however, has virtually leveled the supposed barrier from end to end. Through Maine, New Hampshire, and Vermont runs a railway from Portland to Canada; by canal or by railway, or even by both abreast, New York has reached the waters of the St. Lawrence on at least four principal points between Montreal in the e. and Buffalo in the w.; Pennsylvania has carried to Pittsburgh a railway of 248 m. from Harrisburgh, and a canal of 312 m. from Columbia; while, with the necessary exception of little Delaware alone, the remaining states along the coast have each its iron-way through the A.

The chain abounds in coal and iron, those gifts of nature to industrious man, which in all ages have done so much for civilization, and which, in our own age, have, with the aid of steam, more than doubled all that they had done before; and it is a curious instance of the adaptation of the two worlds to each other, that, while the Spaniard met, in the south, the gigantic counterparts of the central plateau of his own romantic land, the Englishman, in the north, stumbled, as it were, on those same elements of almost creative energy which, within two centuries, were to be so instrumental in placing the daughter next to the mother among the nations of the earth. As an evidence of the actual value of the coal and iron of the A., Pennsylvania—where, hitherto, they have been chiefly found—has since 1840 made more rapid strides in growth of population than any other state in the union, till between 1860 and 1870, when Illinois increased somewhat more rapidly. Nor are iron and coal the only valuable products of the A. To say nothing of the valleys—many of them as fertile as they are lovely—which separate the parallel ranges from each other, the mountains themselves yield limestone, marble, slate, building-stone, copper, zinc, chrome, etc.

*Geology.*—During the azoic and palæozoic periods of the earth's geological history, the district now occupied by the A. was a level plain. These mountains date their origin from a period subsequent to the carboniferous epoch. The coal measures are the newest upturned beds associated with the Appalachian range; and as the stratified rocks, with few exceptions, are laid down horizontally, these strata must owe their inclined position to the dislocating agency which elevated the mountains; they, consequently,

supply a date anterior to its activity. At the base of the A., on their eastern side, there are a series of red sandstone beds, unconformable to the upturned strata, and occupying the valleys in their original horizontality, thus evidently unaffected by the disrupting agency which must have been active prior to their deposition. These beds have been referred by geologists to different ages. That they are old red sandstone, as conjectured by Maclure and others, is now universally denied. Hitchcock's supposition that they were permian, is also considered as referring them to too remote a geological age. W. B. Rogers considered them first as members of the triassic period; but has since, from evidence adduced from the contained organic remains, shown reason for relating them to the beginning of the jurassic period. We thus obtain two grand limiting dates—the carboniferous and jurassic periods—within which the A. must have been formed. There are grounds for being even more specific, and referring the period of the dislocating agency to that immediately subsequent to the carboniferous, represented in the stratified rocks of other districts by the permian series; for the older upturned rock had not only been ruptured and plicated, but also denuded into the various shapes they now present, before the horizontal rocks were deposited.

The late prof. H. D. Rogers, after years of persevering and devoted study, enunciated a theory of mountain formation based on his examination of the A., which not only explains their structure, but admits of a more or less complete application to the mountain-systems of the world. The many proposed theories of mountain elevation are based upon assumptions which, unfortunately, are not true; but that is an unimportant matter to the majority of our speculating geologists, and one never seen by the inventors of the theories, who allow themselves to be led captive by a poetic imagination, instead of building their inductions on field observations. Thus, to suppose that mountains are elevated by a wedge-like intrusion of melted matter, is to give to a fluid functions incompatible with its dynamic properties. So also the supposition that the igneous rocks were intruded as solid wedges, separating and lifting the crust, is opposed to the fact that no apparent abrasion, but generally the closest adhesion, exists at the line of contact of the igneous and stratified rocks. Equally fatal objections can be adduced against the other theories. Prof. Rogers observing that the A. were formed of a series of enormous waves, and comparing this appearance with other elevated districts, especially in Belgium and Britain, enunciated a theory of their structure, of which the following is a condensed view:

Disturbed strata have a wave-like arrangement, their dip being in curved, and never in straight planes; and in extensive areas the varying angles of dip exhibit one or more wide regular curves. These undulations are in the form of long parallel waves, their parallelism being in the line of the general trend of the part of the mountain system to which they belong. When different grades of magnitude, as regards length, height, and amplitude, occur, the waves of the same grade are parallel, while the different grades are not necessarily so. The waves assume three different forms, which are characterized as—*symmetrical flexures*, equally steep on the two slopes; *normal flexures*, having an excess of incurvation on the one side compared with the other; and *folded flexures*, or those with a doubling under of their more incurved slopes, and among which the steepest slopes are generally directed to the same quarters. These three forms, representing different gradations in the flexure, are regular in their succession in disturbed regions, the order being the same as in the diagram—that is, when we start from the most disturbed side, we go from the folded waves to the normal ones, and from these to the symmetrical; and in the same order, the waves, as they recede from the folded side, become progressively wider apart and flatter. Resting on these facts, prof. Rogers advanced his view of the structure of elevated regions in the following words: "The wave-like structure of undulated belts of the earth's crust, is attributed to an actual pulsation in the fluid matter beneath the crust, propagated in the manner of great waves of translation from enormous ruptures occasioned by the tension of elastic matter. The forms of the waves, the close plication of the strata, and the permanent tracing of the flexures, are ascribed to the combination of an undulating and a tangential movement, accompanied by an injection of igneous veins and dikes into the rents occasioned by the bendings. This oscillation of the crust, producing an actual floating forward of the rocky part, has been, it is conceived, of the nature of that pulsation which attends all great earthquakes at the present day."

This theory having originated as an explanation of the phenomena of the A., is easy of application to these mountains. They are composed of a series of parallel waves, having a general direction similar to the coast-line of the Atlantic ocean. The line of maximum disturbance is on their eastern limits; consequently, the folded flexures, with the inversion of their steep sides, are chiefly confined to the great Appalachian valley, and the Atlantic slopes s. of it. The flexures of this type impart a prevailing s.e. dip to the whole outcrop; their number, and the excessive difficulty of detecting and continuously tracing them, frustrates every attempt at mapping them individually. The flexures of the second type, which curve more rapidly on the one side than on the other, prevail wherever the forces that disturbed the crust were neither excessively intense nor very feeble. It is the characteristic form everywhere between the great Appalachian valley and the Alleghany mountains. It distinguishes not only those larger waves which separate the coal-containing strata e. of the Susquehanna into special basins—but the

minor undulations which throw the coal measures of these basins into groups of lesser saddles and troughs. Undulations of the first or symmetrical type occur beyond the Alleghany mountains, where two groups of them may be distinguished: the one subdividing the bituminous coal-field, with its five very broad waves, into six successive basins; the other, composed of four equidistant and very straight undulations, traversing parts of Cambria, Indiana, Somerset, and Fayette counties.

The strata thus elevated, and forming the A., belong entirely to the oldest or palæozoic division of the fossiliferous rocks. Metamorphic rocks, consisting of felspathic, hornblendic, and micaceous gneiss, and mica-slate, exist on the eastern base of these mountains, but have not been noticed as forming part of the plicated strata of the A. Extensive formations of talcose and micaceous slates, indurated clay-slates, and chloritic and steatitic slates, exist in the more disturbed districts. These are highly metamorphosed members of the older fossiliferous, and must not be confounded with, though they so much resemble, the azoic metamorphic rocks.

The palæozoic rocks constitute a vast succession of fossiliferous strata, commencing with the lowest deposits resting on the metamorphic rocks, and terminating with the highest of the coal strata. Their aggregate thickness, as measured in Pennsylvania, amounts to 35,000 ft. While exhibiting a remarkable variety of mineral character, they may be classed under the three great divisions of sedimentary rocks—viz., sandstones, slates, and limestones. Intercalated with them, as subordinate layers, there occur deposits of coal, chert, and iron ore. They are all more or less fossiliferous.

*Coal Measures.*—The character of the rocks of the Appalachian district of North America indicates that during the carboniferous epoch an immense continent existed on the present site of the Atlantic, which supplied materials for the sandstone and slate. It seems to have had an extensive shallow marshy shore, of such a character as to be able to support the vegetation, which has become, in the course of ages, converted into coal. The coal-fields to the far w. of the A., in Michigan, Indiana, Illinois, and Missouri, have been connected with the Appalachian coal formation, which includes all the detached basins, both anthracitic and semi-bituminous, of the mountain chain of Pennsylvania, Maryland, and Virginia, and also the vast bituminous trough lying to the n.w. in Pennsylvania, Ohio, Virginia, Kentucky, Tennessee, and Alabama.

On the eastern slope of the A., the coal, from its proximity to the region of greatest disturbance, has lost nearly all its volatile constituents, and is converted into hard shining anthracite (q. v.). In the troughs to the westward of the great Appalachian valley, where the forces that disturbed the crust were not so intense, the coal has not parted with such a large proportion of volatile matter, but still is so much altered as to be characterized as semi-anthracite. Both the anthracite and semi-anthracite are extensively mined for economical purposes, but their extent as well as their value is of little importance compared with the enormous Appalachian bituminous coal-field. From northern Pennsylvania to middle Alabama, its length is about 875 m., and its greatest breadth between southern Pennsylvania and northern Ohio is about 180 m.; it covers an area of about 56,000 sq. m., and is almost the largest expanse of coal measures in the world. A single coal-seam in this field has been traced over an extent of country 225 m. long by 100 broad, showing a superficial area of 14,000 sq. miles. The actual depth of workable seams in the deepest part of this basin is estimated at 40 ft.; but when the amount of denudation of the upper measures over large districts is taken into account, the average depth of the entire field cannot be more than 25 ft. Taking this as the thickness, the amount of coal in this great coal-field would be 1,387,500,000,000 tons. When this is compared with the estimated quantity of coal in the British coal-fields, viz., 190,000,000,000 tons, some conception may be formed of the enormous extent of coal existing in this district of North America.

*Metals.*—Extensive beds of magnetic, hematitic, and fossiliferous iron ores occur in many of the formations of the A., from the lowest metamorphic gneiss to the highest coal-measures. Iron ore is extensively wrought in Pennsylvania and Ohio, large quantities of the anthracite being used in the smelting furnaces. Veins of lead occur in the metamorphic rocks, rarely stretching up into the red slate. In the palæozoic beds, veins of copper and nickel occur in sufficient quantity to be wrought.

**APPALACHICO'LA**, a river of the United States, rising in Georgia, and flowing through Florida into the gulf of Mexico, or rather into a bay that bears its own name. Reckoning from its remotest sources, the head-waters of the Chatahooche, the A. is about 400 m. long, being navigable for boats throughout nearly its entire course. It is, however, only at the junction of the Chatahooche with the Flint that the name of A. is applied to the stream; and up to this point, a stretch of about 76 m., there is a sufficient depth of water for steam navigation; while the tides also ascend for about two thirds of the distance.—A. is also a seaport at the mouth of the stream above mentioned. Here is shipped the produce of the river basin, consisting chiefly of large quantities of cotton.

**APPANOOSE**, a co. in s. Iowa on the Missouri border; 510 sq. m.; pop. '70, 16,456. It has a fertile surface of rolling prairie, with timber along the watercourses, and large beds of coal. The products are chiefly agricultural. Co. seat, Centerville.

**APPARATUS**, in the sciences, a collection of tools or instruments for experiment. *ing* or working. In physiology, a group or collection of organs associated in a single

function; as, the heart, veins, and arteries are the circulatory A.; the limbs are the A. of locomotion, etc.

**APPARENT.** This term is used to express a number of important distinctions, especially in astronomy. The *A. magnitude* of a heavenly body is the angle formed by two lines drawn from the ends of its diameter to the spectator's eye: this obviously depends upon the distance of the body, as well as upon its real magnitude. A planet seen from the surface of the earth seems lower than if seen from the center of the earth—the former is its *A. altitude*, the latter its real. *A. noon* is when the sun is on the meridian; true or mean noon is the time when the sun would be on the meridian if his motion in the heavens were uniform and parallel to the equator. See EQUATION OF TIME. The daily and annual motions of the sun in the heavens are both *A. motions*, caused by two real motions of the earth.

**APPARITIONS.** The belief that the spirits of the departed are occasionally presented to the sight of the living, has existed in all ages and countries, and usually declines only when a people have advanced considerably in the knowledge of physical conditions and laws. Not that A. then cease to be reported—for this is far from being the case—but that the more intelligent part of the community are then usually able to explain away the alleged occurrence in some way satisfactory to themselves, not involving the admission of a possible projection of a spirit upon the living sense.

Nothing is more certain than that there are conditions of the body when spectral appearances, such as occur to us in uneasy dreams, become sensible to the waking vision. One of these conditions is that of the patient under the disease of *delirium tremens*, who not only hears ideal enemies plotting against his life in adjacent rooms or behind hedges, but thinks he sees them preparing to do him mischief, and has been known to jump overboard of a vessel into the sea, in order to escape the apprehended danger. In such excitements it is, though arising from different causes, that an intending murderer thinks he hears the prince of fallen angels tempting him on to crime, or sees before him a "dagger of the mind" wherewith to end the life of his victim. There are also instances of spectral illusions traceable to a simply disordered state of the digestive organs. M. Nicolai, an eminent bookseller in Berlin, fell, in the early part of the year 1791, into a depression of spirits, and in that condition neglected a course of periodical bleeding which he had been accustomed to observe. The consequence was his becoming liable for some months to seeing trains of phantasms or spectral figures, which moved and acted before him, nay, even spoke to, and addressed him. He was fortunately able, not merely to coolly observe the phenomena, but to describe them in an ample paper which he presented to the philosophical society of Berlin. This case may be said to have formed the basis of a theory of A., advanced by Dr. Ferrier, Dr. Hibbert, and others, amounting merely to this, that they are all to be accounted for by peculiar conditions of the organism of the individual sensible of them.

There is certainly a large class of cases which fall readily under this explanation; but, if we are to accept the whole that have been, on more or less good authority, reported, it must be admitted that a theory of a more comprehensive nature is still required in order to satisfy the duly cautious inquirer.

Let us take, for instance, an apparition story which Dr. Hibbert owns to be one of the best authenticated on record. It was thus written down in 1662 by the bishop of Gloucester, from the recital of the young lady's father: "Sir Charles Lee, by his first lady, had only one daughter, of which she died in childbirth; and when she was dead, her sister, the Lady Everard, desired to have the education of the child; and she was by her very well educated, till she was marriageable, and a match was concluded for her with Sir William Perkins, but was then prevented in an extraordinary manner. Upon a Thursday night, she thinking she saw a light in her chamber after she was in bed, knocked for her maid, who presently came to her, and she asked why she left a candle burning in her chamber. The maid said she left none, and there was none but what she had brought with her at that time. Then she said it was the fire; but that, her maid told her, was quite out; and she said she believed it was only a dream; whereupon she said it might be so, and composed herself again to sleep. But about two of the clock she was awakened again, and saw the apparition of a little woman between her curtain and her pillow, who told her she was her mother, that she was happy, and that by twelve of the clock that day she should be with her. Whereupon she knocked again for her maid, called for her clothes, and when she was dressed, went into her closet, and came not out again till nine, and then brought out with her a letter, sealed, to her father: brought it to her aunt, the lady Everard, told her what had happened, and desired that as soon as she was dead, it might be sent to him. The lady thought she was suddenly fallen mad, and thereupon sent suddenly away to Chelmsford for a physician and surgeon, who both came immediately; but the physician could discern no indication of what the lady imagined, or of any indisposition of her body; notwithstanding the lady would needs have her let blood, which was done accordingly. And when the young woman had patiently let them do what they would with her, she desired that the chaplain might be called to read prayers; and when prayers were ended, she took her guitar and psalm-book, and sat down upon a chair without arms, and played and sung so melodiously and admirably, that her music-master, who was then there, admired at it. And near the stroke of twelve, she rose and sate herself down in a great chair with arms, and pres-

ently fetching a strong breathing or two, immediately expired, and was so suddenly cold, as was much wondered at by the physician and surgeon. She died at Waltham in Essex, three miles from Chelmsford, and the letter was sent to Sir Charles at his house in Warwickshire, but he was so afflicted with the death of his daughter, that he came not till she was buried; but when he came, he caused her to be taken up, and to be buried with her mother at Edmonton, as she desired in her letter."

Dr. Hibbert, in treating of this case, concludes that the young lady was consumptive and about to die, and in this diseased frame of body became the subject of an illusion; but these are assumptions directly contrary to what the record bears, and there is, after all, the singular circumstance to be accounted for, that the young lady's death occurred exactly at the time predicted. To a similar purport is the case of the wife of Dr. Donne, related by Izaak Walton. Donne left his wife pregnant in London, and went with Sir Robert Drury to Paris. Two days after arriving there, he stated to Drury that he had had a vision of his wife walking through his room, with her hair hanging over her shoulders, and a dead child in her arms. 'So impressed were they by the incident that they immediately sent a messenger to London to inquire regarding Mrs. Donne's health. The intelligence brought by the man was, that she had been brought to bed of a dead child at the hour her husband thought he had seen her in Paris. In this case, too, if the requisite disordered state of Dr. Donne were granted, the coincidence of the distant event in its particulars, and in point of time, would remain unaccounted for by Dr. Hibbert's theory.

That there is an abundance of such cases reported, will not be disputed. In what direction speculation regarding them is to move, if the insufficiency of Dr. Hibbert's theory be acknowledged, will probably depend on the general tendency of the movements of science. If psychological study were more in repute, and the phenomena of dreaming in particular were diligently examined, there might be a hope of a satisfactory theory of what are called A. ere the world was many years older.

APPARITOR, a name for officers and public servants who attended magistrates or judges, such as scribes, lictors, and heralds. In England A. is applied to the beadle of a university, who carries the mace, and to the messenger who serves the process of a spiritual court.

APPEAL, in the civil procedure of courts of justice, signifies the removal of a suit from one court or judge to another and higher court or judge, in order that the latter may examine the validity of the former's judgment, either affirming or reversing, altering or varying the judgment. A., however, is not a technical term in the procedure of the English and Irish common-law courts. For many years past, a reconstitution of the English courts of law and equity has been impending, and has now in the main been carried out. Meanwhile it seems convenient to abide by the names and divisions hitherto in use in appeals; the subject can readily be traced under either system of nomenclature.

1. In the courts of *equity* (or of chancery), where there is an A. from the judgment of the master of the rolls, and from the vice-chancellors, or rather, as those judges form part of the chancery division of the high court of justice, the A. lies from such division to the new court of appeal generally; the jurisdiction of the house of lords being retained in 1875. so far as regards all appeals from the various courts and divisions of the high court of justice. The construction of the latter court, as also of the new court of appeal, is given under the article Common Law, Courts of (q.v.).

2. In the courts of *bankruptcy*, the judgments of which may be appealed from now directly to the chancery division, and ultimately to the house of lords, under certain restrictions.

3. In the *probate division*, there is an A. to the court of A., with leave of the court. In the procedure of this tribunal there is also an A. from the county court, where such court has jurisdiction, to the probate division itself, whose judgment is final, unless with leave of the court.

4. In the court of *divorce* and *matrimonial causes*, the decision of the judge ordinary, sitting alone, may be appealed to the court of A. for the present. And in the case of a decree dissolving a marriage, there may be an A. to the court of A.

5. In the admiralty courts there is an A. to the court of A., as the jurisdiction in admiralty causes is merged in the division of the high court of justice called the probate, divorce, and admiralty division, and which stands on the same footing towards the supreme court as the other divisions.

6. There is also an A. to the privy-council (to be merged in the court of A.), from the courts of India and from the colonial courts generally; and such A. includes the sentences, not only of courts of primary jurisdiction, but also of courts of A. in the colonies, and all the dependencies of the crown;\* in applications to prolong the term of

\* As to colonial causes, we are informed by Blackstone that the jurisdiction of the privy-council was "both original and appellate. Whenever a question arises between two provinces out of the realm, as concerning the extent of their charters and the like, the king in his council exercises original jurisdiction therein, upon the principles of feudal sovereignty. And so likewise, when any person claims an island or a province, in the nature of a feudal principality, by grant from the king or his ancestors, the determination of that right belongs to the king (or queen) in council, as was the case of the earl of Derby, with regard to the Isle of Man, in the reign of queen Elizabeth, and the earl of Cardigan and others, as representatives of the duke of Montague, with relation to the island of St. Vincent, in 1764."

patents for new inventions; and in making orders in certain cases relative to copyright, pursuant to the provisions of the copyright acts.

Practically, however, as we are told by Mr. Stephen in his commentaries, all judicial authority of the privy-council was long exercised by a *committee* of privy-councillors, called the judicial committee of the privy-council; who heard the allegations and proofs, and made their report to her majesty in council, by whom the judgment in the final instance is given.

In the practice of the common-law courts of England—that is, the court of queen's bench, the court of common pleas, and the court of exchequer, or, as is put by lord Coke, any court whose proceedings are regulated by the common law—the procedure by way of A. was, as stated at the beginning of this article, technically not so called, but was also called *error*, the party complaining of the judgment being called the plaintiff in error, instead of appellant, and his opponent, the defendant in error, instead of respondent. Formerly, the proceedings commenced by suing out a writ of error first to a court of intermediate A., once the court of exchequer chamber, and afterwards by a further writ of error to the house of lords. But by the common-law procedure act of 1852 (15 and 16 Vict. c. 76, s. 148), writs of error are abolished, and now the word appeal is used in all cases indiscriminately.

Error also lies to the high court in criminal cases, when, *after judgment*, it is considered that the indictment is bad in substance, or that the judgment is erroneous, or in respect of any other substantial defect appearing on the face of the record. A court called the court for crown cases reserved, consisting of five judges, disposes of cases where the judge or court had some doubt at the trial as to a point of law. And there is also practically an appeal to a superior court from all magistrates' decisions on points of law.

As to redress by way of A. and error against the judgments in the courts of Ireland, the procedure is so similar to that hitherto employed with respect to the English courts, that we need not here enter into particulars on the subject. We may simply remark, generally, that the Irish chancellor, sitting alone, does not appear to exercise any appellate control over courts inferior to his own, such as that possessed by the chancellor in England; for, according to the Irish practice, the A., for instance, from the master of the rolls, and in the case of proceedings in bankruptcy, is not to the chancellor himself alone, but to the court of A. in chancery, in which the chancellor and a lord justice of A. are the appointed judges; and which court of A. likewise reviews the chancellor's own individual judgments. The judgments of this court of A. itself, however, may afterwards be reviewed on A. by the house of lords. In criminal procedure, the same act (11 and 12 Vict. c. 73) applies to Ireland as well as to England.

In the procedure of the Scotch courts, there are various appeals in the practice of the sheriff or county courts, and in the proceedings in bankruptcy; and the house of lords reviews the judgments of the court of session, the supreme civil court of the country, and which tribunal, indeed, it may be said, supplies the house with a large portion of its judicial business. This circumstance has frequently been remarked on as proving a litigious disposition on the part of the Scotch; but perhaps the greater number of Scotch appeals over English and Irish may be more fairly said to be occasioned by a natural feeling on the part of litigants and lawyers in Scotland, that there is a better chance of a nice and critical examination of the judgments appealed against by such judges as preside in the house of lords, whose legal and judicial minds have been formed under a different and larger system of jurisprudence than prevails in Scotland, than there would be to a tribunal composed entirely of Scotch lawyers. Indeed, although the judicial staff of the house of lords are chiefly English lawyers, the system of A. to their lordships from the Scotch courts works extremely well, and gives entire satisfaction to the Scotch people. Some of the most valuable elucidations of the peculiar principles of Scotch law are to be found in the judgments in Scotch appeals by the chancellors and other law lords who, since the union with Scotland, have administered the jurisdiction of the house in the last resort, but who were never in a Scotch court, and, until called upon to discharge such responsible functions, had nothing but English experience. In 1875 it was left uncertain whether Scotch and Irish appeals should continue to be to the house of lords, and settled in 1876 that they should.

There is no A. to the house of lords from Scotland in criminal cases, nor does the above-mentioned act—11 and 12 Vict. c. 78, creating a court of criminal A. for England and Ireland—extend to Scotland. But the high court of justiciary there, which is the supreme criminal tribunal, and is composed of seven judges of the court of session, presided over by the lord justice general, or lord president, as he is otherwise called, reviews the procedure of all the criminal courts of the country (excepting where such jurisdiction is expressly excluded by statute); and it is believed that no inconvenience is experienced in consequence of there being no other or further A. from the sentences of these courts.

**APPEAL** (*ante*). In the United States an A. is understood to mean the re-hearing by a higher court of a cause or trial which has been decided in due form of law; or the removal to a higher court or authority of a cause pending. In practice, it is the removal of a cause from a court of inferior, to one of superior, jurisdiction, for the pur-

pose of obtaining a review and re-trial. It is, in its origin, a civil-law proceeding and differs from a writ of error in this: that it subjects both the law and the facts to review and re-trial, while a writ of error is a common-law process which removes only matter of law for re-examination. On an A, the whole case is examined and tried, as if it had not been tried before; while on a writ of error the matters of law only are examined, and judgment is reversed if any errors have been committed. An A. generally annuls the judgment of the inferior court so far that no action can be taken upon it until after the final decision of the cause. Rules regulating A. are various in various states. In New York, the court of appeals is the last resort; in the union, the supreme court of the United States.

**APPENZELL** (from *Abbat's Cella*), a canton in the n.e. of Switzerland. Area, 163 sq. miles. Pop. '76, 60,786. It is divided into two districts—Innerrhoden and Ausserrhoden, the former of which is peopled by Roman Catholics, the latter by Protestants, and noted for its dense population. The surface is mountainous, especially in the s., where Mont Sentis attains an elevation of 8232 feet. The chief river is the Sittern, which flows through the center of the canton. A. holds the 13th place in the Swiss confederacy; the constitution of each half of the canton is a pure democracy. The inhabitants are chiefly employed in agriculture, cattle-keeping, cotton manufactures, and embroidery. They are fond of dancing, music, and athletic exercises, and have the reputation of being first-rate marksmen.

*Appenzell*, the capital of the canton of the same name, is situated on the left bank of the Sittern, in lat. 47° 29' n., and long. 9° 24' e. Pop. '70, 3686. The town is ill built, and has only a small trade in linens. The other towns are Trogen (with a pop. of 2912, and manufactures of linen and muslin), Herisau (pop. 9727), etc.

**APPELLEY**, CHARLES JAMES, the "Nimrod" of the *Quarterly Review*, is a writer who deserves mention, if not from the intrinsic importance of the subjects on which he exercised his pen, at least from the perfection he attained in the department to which he confined himself. He was the son of a Welsh country gentleman, and was b. in Denbighshire in 1777. His education at Rugby stimulated his love of field-sports more than his love of the classics. At the age of 24, he married, and went to reside at Bilton Hall, in Warwickshire, where he devoted his energies as exclusively to the chase as the great Nimrod himself could have done. He hunted everywhere in Great Britain. In 1821, he began to contribute to the *Sporting Magazine*. His clever, gossiping articles were so much relished, that in two years that periodical doubled its circulation. The proprietor, Mr. Pittman, was of course highly gratified. He remunerated Mr. A. handsomely, kept a stud of hunters for him, and paid the expenses of his sporting tours; but "Nimrod" seems to have been of rather expensive habits, and to have occasionally required an advance of money from his employer. When Mr. Pittman died, his relatives entered into a lawsuit with the "mighty hunter," for the recovery of this money. Nimrod, however, prudently transferred himself to France, where he chiefly resided during the rest of his life. He d. on the 19th of May, 1843. His best writings are *The Chase, the Turf, and the Road*, which appeared in the *Quarterly Review* (1827).

**APPERT**, BENJAMIN NICOLAS MARIE, a French philanthropist, was b. in Paris, Sept. 10, 1797. He began his course in 1816 by introducing into several schools a system of mutual instruction, and, in 1820, founded and conducted gratuitously a school for the prisoners at Montaign. Being suspected of having aided the escape of two prisoners, he was himself confined in the prison of La Force, where he made good use of his opportunities of becoming acquainted with the moral and physical circumstances of prisoners. After his liberation, he prosecuted his benevolent plans with renewed zeal, and undertook a journey through the whole of France, in 1825, to inspect schools, prisons, hospitals, etc. The results were given in his journal. After the July revolution, he was employed by Louis Philippe to superintend the measures taken for the relief of the indigent classes. In his travels, he visited Belgium, Prussia, Austria, Saxony, and Bavaria, and gave the results of his observations on the management of schools, hospitals, prisons, etc., in several works. He also wrote a work entitled *Dix Ans à la Cour du Roi Louis Philippe*, and, in his *Conférences contre le Système Cellulaire*, strongly opposed the system of solitary confinement. Though onesided in some of his views, A. is a sincere, warm-hearted, and practical philanthropist.

**APPERT**, FRANÇOIS, a French technologist, the inventor of a method of preserving meat, vegetables, and other articles of food without the use of salt or other chemical application. This method is fully described in his work *L'Art de Conserver toutes les Substances Animales et Végétales* (4th edition, Paris, 1831). See ANTISEPTICS.

**APPETITE**. See HUNGER and THIRST.

**APPIANI**, ANDREA, styled in his day "the painter of the graces," was b. at Milan, May 23, 1754. His poverty compelled him to gain a subsistence by decorative painting; but in the course of his travels, he studied the works of great masters, and formed for himself an original style, almost rivaling that of Correggio. At Rome, he devoted his attention to the frescoes of Raphael, and made such progress, that he soon excelled all living artists in fresco-painting. The best evidences of his genius are found in the cupola

of the church of *Sta. Maria di S. Celso* at Milan; and in the frescos with which he decorated the villa of the archduke Ferdinand in 1795. Napoleon I. appointed him court-painter. In return, he executed portraits of the French emperor and several of his generals. His most beautiful frescos are the paintings on the ceilings of the palace of Milan, which consist of allegorical illustrations of Napoleon's career; and Apollo with the muses in the villa Bonaparte. Almost all the palaces in Italy contain frescos by A. His finest oil-painting is Rinaldo in the garden of Armida. The fall of his patron, Napoleon I., left A. in indigent circumstances. He d. Nov. 8, 1817.

**APPIANUS**, a native of Alexandria, who flourished during the reigns of Trajan, Hadrian, and Antoninus Pius. He was author of a Roman history, in 24 books, of which only 11 are extant. It was not remarkable for anything except the plan on which it was written. Instead of proceeding to exhibit chronologically the growth of the empire, from its rude beginning on the Palatine hill, to the period when its power held the whole world in awe, which is at once the popular and the philosophical method, he divided his work into ethnographic sections, recording separately the history of each nation up to the time of its conquest by the Romans. First in order were the books devoted to the old Italian tribes, and afterwards followed the history of Sicily, Spain, Hannibal's wars, Libya, Carthage, and Numidia, Macedonia, Greece proper and its colonies, Syria, Parthia, the Mithridatic war, the civil wars, and the imperial wars in Illyria and Arabia. As a historian, A. is a mere compiler, and not very accurate in his compilation. His geographical knowledge, in particular, is singularly deficient, considering the age in which he lived. One specimen of his blunders will suffice: in his section on Spain, he states that it takes only half a day to sail from Spain to Britain. The edition of A. by Schweighäuser is highly esteemed, but the most complete is that in the *Bibliothèque Grecque* of Firmin Didot.

**APPIAN WAY** (Lat. *Via Appia*), well named by an ancient writer *regina viarum* (the queen of roads), was formed, in part at least, by Appius Claudius Cæcus, while he was censor (313 B.C.). It is the oldest and most celebrated of all the Roman roads. It led from the *Porta Capena* at Rome, in a southerly direction to Capua, passing through Three Taverns, Appii Forum, Terracina, etc. Subsequently, it was carried on to Beneventum, Tarentum, and thence to Brundisium. It had an admirable substructure or foundation, from which all the loose soil had been carefully removed. Above this were various strata cemented with lime; and, lastly, came the pavement, consisting of large hard hexagonal blocks of stone, composed principally of basaltic lava, and jointed together with great nicety, so as to appear one smooth mass. The remains of it are still visible, especially at Terracina. The cost must have been enormous, for the natural obstructions are great. Rocks had to be cut through, valleys filled up, ravines bridged, and swamps embanked.

**APPIUS CLAUDIUS CRASSUS**, a Roman decemvir (451-449 B.C.). While the other decemviri were engaged in repelling an incursion made by the Sabines, A. C. and his colleague Oppius remained in Rome, with two legions to maintain their authority. Meanwhile, A. C. had been smitten by the beauty of Virginia, daughter of a respected plebeian named Lucius Virginius, who was abroad with the army. By force and stratagem, representing that she was the born slave of Marcus Claudius, one of his clients, A. C. gained possession of the maid. His design was penetrated by Icilius, who was betrothed to Virginia, and who, aided by Numitorius, her uncle, threatened to raise an insurrection against the decemviri. Virginius, hurriedly recalled from the army by his friends, appeared and claimed his daughter; but, after another mock-trial, she was again adjudged to be the property of Marcus Claudius. To save his daughter from dishonor, the unhappy father seized a knife and slew her. The popular indignation excited by the case was headed by the senators Valerius and Horatius, who hated the decemvirate. The army returned to Rome with Virginius, who had carried the news to them, and the decemviri were deposed. A. C. died in prison by his own hand (as Livy states), or was strangled by order of the tribunes; his colleague, Oppius, committed suicide; and Marcus Claudius was banished. The *Claudia Gens* (see **GENS**) was one of the most numerous and important of the patrician tribes or clans of Rome; and besides the sons and grandsons of the decemvir, there were numerous persons of distinction who bore the name of Appius.

**APPLE**, *Pyrus malus*. (For the generic character, see **PYRUS**.) This well-known fruit has been very long cultivated, and by that means it has been very much improved. It was extensively cultivated by the Romans, by whom, probably, it was introduced into Britain. The wild A., or CRAB-tree, a native of Britain, and very generally found in temperate climates of the northern hemisphere, is a rather small and often somewhat stunted-looking tree, with austere, uneatable fruit, yet it is the parent of all, or almost all the varieties of apple so much prized for the dessert. The A.-tree, even in a cultivated state, is seldom more than 30 to 40 ft. high. It has a large round head; the leaves are broadly ovate, much longer than the petioles, woolly beneath, acute, crenate, and provided with glands; its flowers are always produced, 3 to 6 together, in sessile umbels, and are large, white, rose-colored externally, and fragrant. The fruit is roundish, or narrowest towards the apex, with a depression at each end, generally green, but also frequently yellow, light red, dark red, streaked, sometimes even almost black, with the rind

sometimes downy, sometimes glabrous, sometimes thickish, and sometimes very thin and transparent, varying in size from that of a walnut to that of a small child's head—the taste more or less aromatic, sweet, or subacid. It is produced on spurs, which spring from branchlets of two or more years' growth, and continue to bear for a series of years. The fruit of the A. is, with regard to its structure, styled by botanists a *pome* (q. v.). The eatable part is what is botanically termed the *mesocarp* (see FRUIT), which, in its first development, enlarges with the calyx, the summit of the fruit being crowned at last by the dried 5-parted limb of the calyx; the *endocarp* being, when ripe, cartilaginous, and containing in its cells seeds which do not correspond with them in size, but are so free as often to rattle when it is shaken.

The A. is now one of the most widely diffused of fruit-trees, and in the estimation of many, is the most valuable of all. It succeeds best in the colder parts of the temperate zone. It is, however, to be met with on the coasts of the Mediterranean Sea, in Arabia, Persia, the West Indies, etc., but there its fruit is as small and worthless as in high northern latitudes. The varieties in cultivation are extremely numerous. They have been classified with great care by recent German writers, by whom the classification and description of apples, pears, and similar fruits, has been treated as a sort of science, and dignified by the name of Pomology. Metzger, in his description of the pomaceous fruits of southern Germany, describes 89 different kinds of A., all of which are constant, besides sub-varieties. New varieties are continually produced; and as they are chiefly preserved and propagated by grafting—although some of them also grow by layers and cuttings—the old ones gradually die out. The *costard*, from which dealers in apples received the name of costardmongers, is no longer known. Many varieties are designated by the general names of *pippins*, *rennets*, *codlins*, and *calvilles*. Some kinds, not approved for the dessert, are in high esteem as baking-apples, and others still more acid or austere are preferred for the manufacture of Cider (q. v.).

The A. is grown in Britain either as a standard, an espalier, or a wall-tree, and is variously trained. It is usually grafted on A. or crab-stocks, but succeeds also on hawthorn-stocks, and is in this way sometimes introduced into hedges. A very dwarf variety, called the *paradise A.*, is often used as a stock on which to graft in order to produce dwarf trees; and trees thus dwarfed are often very productive when little larger than currant or gooseberry bushes. Some of the varieties of A. are more hardy than others, and are therefore to be preferred for cold or exposed situations. Some of the finest kinds succeed well only when the soil and climate are good. Some kinds are much earlier than others, both in flowering and ripening.

The wood of the A.-tree is hard, durable, and fine-grained. The crab is often planted both as an ornamental tree and for the sake of its wood. The bark contains a yellow dye.—As a fruit-tree, the A. requires a fertile soil and sheltered situation. The various uses of the fruit—for the dessert, for baking, preserving, making jelly, etc., as well as for making the fermented liquor called cider—are sufficiently well known. Vinegar is also made from it; and sometimes a kind of spirit, especially in Switzerland and Swabia. It contains *malic acid*, which is extracted for medicinal purposes. The fermented juice of the crab A. is called *verjuice*. It is used in cookery, and sometimes medicinally; also for the purifying of wax. Apples are an important article of commerce. Great quantities are imported into Britain, chiefly from France, Canada, and the northern parts of the United States. The A. keeps better than most kinds of fruit.

*Beaufins* or *Biffins* are apples slowly dried in bakers' ovens, and occasionally pressed till they become soft and flat. They are prepared in great quantities in Norfolk.

The SIBERIAN CRAB is perhaps the parent, by hybridization or otherwise, of some of the varieties of A. now in cultivation. Two species partake this designation, both natives of Siberia, and frequent in gardens in Britain, *pyrus baccata* of Linnæus, and *pyrus prunifolia* of Willdenow, which, however, scarcely differ, except that in the former the sepals (leaves of the calyx) are deciduous, in the latter they are persistent—a circumstance of very doubtful importance as a specific distinction. The fruit is sub-globose, yellowish, and rather austere, but is good for baking and preserves.

THE AMERICAN CRAB or SWEET-SCENTED CRAB (*p. coronaria*) is a native of North America, especially of the southern part of the Alleghanies. It is a small tree with broad leaves and white flowers, becoming purple before they drop off, and which have a powerful smell, resembling that of violets. The fruit is flatly orbicular, of a deep green color, and sweet-scented. It is very acid, but is made into cider and also into preserves. *P. angustifolia*, a native of Carolina, much resembles this, but has much narrower leaves and smaller fruit.

THE CHINESE CRAB (*p. spectabilis*) is a small tree, a native of China. It is very ornamental when in flower; the flowers being in sessile, many-flowered umbels, and of a bright rose-color. The fruit is irregularly round, about the size of a cherry, yellow, and fit to be eaten, like the medlar, only when in a state of incipient decay.

APPLE OF SODOM. See SOLANUM.

APPLEBERRY. See BILLARDIERA.

APPLEBY, the co. t. of Westmoreland, lies in lat. 54° 35' n., long. 2° 28' w. It is in the n. of the co., on the river Eden, which flows past Carlisle into the Solway firth. A. has two parishes, one on each side of the river, which is here crossed by an old stone

bridge of two arches. There is a cascade in the t., the keep of which, called Caesar's tower, is still in tolerable condition. The Lent and summer assizes are held at A. Until the passing of the reform bill, it returned two members to parliament. It was then disfranchised, though it still possesses a municipal corporation. Pop. '71, 1989.

**APPLETON**, a t. of Wis., in the United States, worthy of notice chiefly from its promising situation on the Grande Chute of the Fox river. The Grande Chute, from which the t. sometimes takes its name, affords immense water-power; and at the same time a series of dams renders the stream navigable for steamboats through its whole course—a navigation which, with the aid of a canal between the Fox on the n., and the Wisconsin to the s., is carried all the way from lake Michigan to the Mississippi. Pop. '70, 4518.

**APPLETON, DANIEL**, 1785–1849; b. Mass. He was in business as a trader in Haverhill and Boston, and lastly at New York, where he was the head of the important publishing house of "D. Appleton & Co.," building up an immense business, which is still continued by his sons.

**APPLETON, GEORGE SWETT**, 1821–78; son of Daniel, an American publisher. At the age of 19 he went abroad; he spent four years at the university of Leipsic, devoting himself to literary and historical researches, and the languages of France, Italy, and Germany. He began business alone in Philadelphia, but in 1849, with three brothers, John, William, and Sidney, succeeded to his father's large publishing business in New York. Among numerous publications which have given this house its high standing, the *American Cyclopædia* is conspicuous.

**APPLETON, JESSE, D.D.**, 1772–1819; b. N. H., a theologian, educated at Dartmouth, and in 1797 ordained pastor of a Congregational church in Hampton, N. H. From 1807 to 1819 he was president of Bowdoin college. He was often called to preach before missionary, peace, and Bible societies, and other public bodies. Franklin Pierce, president of the United States (1853–57), was his son-in-law. His sermons and other works have been published by another son-in-law.

**APPLETON, NATHAN, LL.D.**, 1779–1861; b. N. H.; a merchant and manufacturer, and writer on finance. He, with others, started the first power-loom for weaving cotton in the United States. He was one of the Merrimac company whose enterprise founded the city of Lowell. He served several terms in the Massachusetts legislature, and in 1830 was sent to congress, where he was one of the prominent advocates of a tariff for protection. He was again elected to congress in 1842. He published a treatise on currency and banking, a history of the introduction of the power-loom, and the early history of Lowell.

**APPLETON, SAMUEL**, 1766–1853; b. N. H.; an eminent philanthropist, brother of Nathan. He was one of a family of 12 children, and passed his boyhood on a farm, but managed to get sufficient education to become a teacher at the age of 17. In 1794, he and his brother Nathan went into the English trade, in Boston, and afterwards added ventures in cotton manufacture, in which they made a great fortune for those times. He spent much of his time for more than 20 years in other countries, and retired from active business in 1823, when he resolved to devote his entire income to charitable, benevolent, and scientific purposes, and at his death bequeathed \$200,000 more for similar purposes. Besides these large gifts, he was for many years accustomed to distribute liberal aid to the poor and unfortunate.

**APPLING**, a co. in s.e. Georgia, 1060 sq. m.; pop. '80, 5,275—1193 colored. It has a level, sandy soil, and is drained by branches of the Santillo. The productions are corn, oats, rice, sweet potatoes, and some cotton and molasses. Co. seat, Holmesville.

*Written.*

*Played.*

**APPOGIATURA**, an Italian musical term, designating a form of embellishment by insertion of notes of passage in a melody. The A. notes are printed in a smaller character than the leading notes of the melody, and should always be given with considerable expression. When they are extemporized by a performer or singer, they serve as an indication of good or of bad taste. The time of an A. is taken from the essential note to which it belongs, as in the following example:

For **APPOGIATO**, see **PORTAMENTO**.

**APPOINTMENT**. In the law of England there are frequently reserved in common law conveyances granted on a consideration, and in family settlements, certain *powers*, as they are called, such as powers of jointuring, selling, charging land with the payment of money; and the subsequent exercise of the power is called an A. This A.—which may be made either by deed or by will—is not considered as an independent conveyance, but is merely ancillary to the deed or instrument in which the power of A. is reserved, and from which the party in whose favor the A. is made for most purposes derives his title. The courts of equity give relief against a defective A., or defective execution of

a power, where there is what is called a "meritorious consideration" in the person applying for such relief. As to what amounts to such meritorious consideration, lord St. Leonards, in his work on powers, lays down that equity will relieve the following parties: 1. A purchaser, including in such term a mortgagee and lessee; 2. A creditor; 3. A wife; 4. A legitimate child; and 5. A charity. But in the case of a defective A. by a wife in favor of her husband, there is no relief in equity; nor is the equity extended to a natural child; nor to a grandchild; nor to a father or mother, or brother or sister, even of the whole blood, much less of the half-blood; nor to a nephew or cousin. Against the legal consequences of an A., the courts of equity give no aid.

In the Scotch law, the expressions *reserved power* and *faculty to burden* correspond to the English phrase "power of A.;" and the deed or instrument subsequently executed in virtue of the reserved power, is simply described according to the nature and quality of the conveyance so made; but the term A. is not a technical word in Scotland.

**APPOINTMENTS.** The "A." of a ship are, collectively, all her various articles of equipment and furniture. In like manner, the "A." of a soldier, especially a trooper, comprise many miscellaneous necessities which can come collectively under no other name, but which, in part, will be found noticed under later headings. See EQUIPMENT, KIT, KNAPSACK.

**APPOLD, JOHN GEORGE, 1799-1864;** an English civil engineer. His chief inventions are centrifugal pumps for drainage, a process for dressing furs, and an apparatus for paying out submarine telegraph wire, which was very useful in laying the Atlantic cable. He made also many curious automatic machines for opening doors, etc.

**APPOMATTOX**, a co. in s.e. Virginia; 260 sq.m.; pop. '80, 10,110—4536 colored. Its surface is rough, much of it covered with timber, but the soil is fertile and adapted to wheat, corn, oats, and tobacco. The Southside railroad runs through it. Co. seat, A. Court house, or Clover Hill.

**APPOMATTOX COURT HOUSE**, a village in A. co., Va., where the confederate gen. Lee surrendered to gen. Grant, April 9, 1865; the surrender which ended the war of the rebellion.

**APPONYI, György**, a Hungarian statesman, b. 1808. He was a member of the Presburg diet of 1843, and chancellor of Hungary in 1847, when he opposed the revolutionary movements then breaking out, and which caused his retirement. In 1859, he was made a member of the imperial council in Vienna, and was instrumental in bringing about the reconciliation between Austria and Hungary. He is a leading conservative, and is classed among the ablest of European statesmen.

**APPOQUINIMINK**, a hundred (t. or township) in Delaware; pop. '70, 4299.

**APPORTIONMENT** is a legal term derived from the 4 and 5 Will. IV. c. 23, called the A. act, which has given rise to much litigation in England and Scotland, and the principle of which may be stated to be this—that in the event of the termination of a life-interest by death, or of a more limited interest at a fixed period, the current rent or income shall be apportioned or paid over in such a way as to give the personal representatives of the party, or the party himself, as the case may be, a sum corresponding to the period that may have elapsed between the last date of payment and the death or other determination of the interest or estate. But the act has no application to annual sums payable by any policy of assurance, nor to any case in which a stipulation has been made that no A. shall take place.

This act was not understood to apply to Scotland till the year 1844, when it was decided by the court of session that it did so apply, and the judgment was afterwards affirmed by the house of lords. But, in consequence of the act being expressed exclusively in the technical phraseology of the law of England, it has given much trouble. And a later act of 33 and 34 Vict. c. 85, extends the principle to all rents, annuities, salaries, pensions, dividends, and other periodical payments, in the nature of income, so that all these now, like interest on money lent, are considered as accruing from day to day. When a person therefore dies, the income is counted up to the day of death, and is payable at the same time as the next quarterly or other payment would be if no death had happened.

In English law, A. also takes place where the tenant, under a lease, has been deprived of part of the land out of which the rent issues, by a person having a better title than that of the lessor, or proprietor, or where part of the rent has been surrendered by the tenant to the lessor, or where the lessor has disposed of the reversion as to part. But where the tenant has been wrongfully deprived by the act of the landlord himself, even of a part of the premises, there can be no A., but the whole rent will be suspended so long as such a state of things continues.

A. also obtains in the case of a conveyance of land to which the common of pasture is an appurtenance, the party getting the land being entitled to a proportionate use of the common.

**APPORTIONMENT BILLS**, in the United States, are laws of congress after each decennial census, to define the number of members of the house of representatives to which the several states are entitled. Every state has at least one member. Nine A. B.

have been passed. The first constitution adopted by the original 13 states fixed the number of members at 65, and the number of representative population required to be entitled to a member at 30,000. Representative population then meant all free white citizens and three fifths the number of slaves; two fifths of the slaves, all aliens, and Indians not taxed, were excluded from any share in choosing members of congress. The extinction of slavery has made all colored people, except the very few aliens among them, representative citizens. The following figures show the variations of apportionment made for each census:

Period.	States.	Members.	Pop. to a member.	Period.	States.	Members.	Pop. to a member.
1789.....	13	65	30,000	1830.....	24	240	47,700
1790.....	15	105	33,000	1840.....	26	233	70,680
1800.....	16	141	33,000	1850.....	32	234	93,433
1810.....	17	181	35,000	1860.....	34	243	137,281
1820.....	24	213	40,000	1870.....	37	293	131,425

The house had grown rapidly in number of members until 1830, when it was found that it would soon become unwieldy unless the number required to a member should be largely increased; so the ratio was nearly doubled (raised from 47,700 to 70,680). Since then the purpose has been to keep the house below 300 members, and the ratio is raised regularly, while the number of members is seldom increased unless by the addition of new states. In that way the house was increased by the admission of Oregon in 1859, Nebraska and Nevada in 1863, and Colorado (making the 38th state) in 1873. A. B. are passed in the states for the distribution of the state senators and assemblymen, after certain periods, generally of 10 years intermediate with the federal period. Thus New York apportioned after enumerations of 1845-'55-'65-'75.

**APPOSITION**, a term in grammar signifying the annexing of one substantive to another, in the same case or relation, in order to explain or limit the first; as, *my brother, the physician; Thomas the Rhymist*. Whole sentences or clauses admit of A.: thus, "Napoleon sought the way to India through Russia, a stroke of genius." Sometimes a connecting word is used where logical propriety would require A.; as, *the city of London, for the city London*.

**APPRAISERS and APPRAISEMENT**. An appraiser is a person employed to value property, but he must be licensed for the office. Formerly, under the 55 Geo. III. c. 184, this annual license cost only 10s.; but by the 8 and 9 Vict. c. 76, s. 1, on the preamble that it is expedient to increase this duty, the provision of the 55 Geo. III. is repealed, and a duty of £2 substituted for the 10s. Such a license must now be taken out yearly by every person, except a licensed auctioneer, who shall exercise the occupation of an appraiser, or who, for any gain, fee, or reward, shall make any appraisement or valuation chargeable by law with any stamp-duty (see Tilsley on the stamp-laws, 2d ed., p. 65).

By an old English statute, passed in the reign of Edward I., appraisers are enjoined to put a reasonable price upon goods; and if they appraise them too high, they are obliged to take them at their own valuation, and to be answerable accordingly to the creditor for his debt.

Appraisement, generally, is the act of valuation made by the appraiser; but in legal application in England, this term is used to signify a valuation of goods taken under a distress for rent by two appraisers, who are sworn by the sheriff, under-sheriff, or constable, to value the goods truly, according to the best of their skill; and after such appraisement, the goods may be sold at the best price that can be procured.

The duties on appraisements are for £5 and under, 3d.; from £5 to £10, 6d.; from £10 to £20, 1s.; from £20 to £30, 1s. 6d.; from £30 to £40, 2s.; from £40 to £50, 2s. 6d.; and where it shall exceed

£50, and not exceed £100,	£0 5 0
100, " " 200,	0 10 0
200, " " 500,	0 15 0
500,	1 0 0

The exemptions from such duties are appraisements or valuations made in pursuance of the order of any court of admiralty or vice-admiralty, or of any court of appeals from any sentence, adjudication, or judgment of any court of admiralty or vice-admiralty; and appraisements or valuations of any property made for the purpose of ascertaining the legacy-duty payable in respect thereof.

The corresponding proceeding in Scotland is known under the term *appreciation*, which has been defined as the valuing of *poinded* or distrained goods. And by the old Scotch law, these goods were valued twice by different valuers—once in the house or on the ground where the poinding took place, and a second time at the market-cross of the local jurisdiction or chief county town. But by the 54 Geo. III. c. 137, s. 4, one valuation in the place where the goods are, is declared in every case to be sufficient.

**APPRAISERS and APPRAISEMENT (ante)**. In the United States the law requires the appraisement of property of insolvents and decedents in certain cases; of property taken from public use or for corporations; and in most states, of property seized by

creditors. There are many uses for appraisement in private business, the parties mutually agreeing as to how and by whom it shall be done. In litigated causes, and where the public are concerned, courts appraise, or name persons to do so.

**APPREHEND.** To A., in criminal law, means to arrest or seize, in virtue of a warrant or other legal authority, an offender taken in the act, or who is suspected. Arrest or apprehension by officers *without warrant* may be executed by the following persons: 1. By a justice of the peace, who may himself A., or cause to be apprehended, by word only, any person committing a felony or breach of the peace in his presence; 2. The sheriff; 3. The coroner; 4. The constable; 5. By the larceny act (24 and 25 Vict. c. 96), and by the 24 and 25 Vict. c. 97, called the malicious injuries act, a person committing any offense under the same, except that of angling in the daytime, may immediately be apprehended without written warrant. Watchmen—either those appointed by the statute of Winchester (13 Edw. I. c. 4.), to keep watch and ward on all towns from sunset to sunrise, or such as were mere assistants to the constable—might, in virtue of their office, arrest all offenders, and particularly night-walkers, and commit them to custody till the morning; but not so now.

Any private person, and, *a fortiori*, a peace-officer, that is present when any felony is committed, is bound by the law to arrest the felon, on pain of fine and imprisonment, if he is negligently permitted to escape; and by 24 and 25 Vict. c. 95, they may apprehend any person found committing any offense against the provisions of that statute, or any indictable offence by night, that is, between nine in the evening and six in the morning of the next day. They may also, in the case of a person committing a felony in their presence, justify breaking open doors in pursuit of him. Upon probable suspicion, however, no one, being a private person, may arrest the felon or other person so suspected. And there is this distinction between the case of a peace-officer and that of a private person—that the former is protected, though it should turn out that no such crime as supposed has been in fact committed by any one, providing he had reasonable ground for suspecting the party arrested; but the latter acts more at his peril, and is not protected unless he can prove an actual commission of the crime by *some one*, as well as a reasonable ground for arresting the particular person. It is also to be observed that a private person cannot, on mere suspicion, justify breaking open doors, which a constable, though acting without a warrant, sometimes may do. Within the metropolitan police district, a constable may take into custody, without warrant, all persons whom he may find, between sunset and the hour of eight in the morning, loitering or lying about, and unable to give a satisfactory account of themselves; or persons charged with aggravated assaults; or persons offending against the metropolitan police acts, whose address cannot be ascertained. See 2 and 3 Vict. c. 47, ss. 36, 64, 65.

The Scotch law, with regard to the apprehension of criminals, is substantially the same as the English.

By the statutes passed in 45 Geo. III. c. 92, and the 11 and 12 Vict. c. 42, facilities are afforded for the apprehension of criminals in England, Ireland, or Scotland, under warrants issuing from the respective authorities of the three countries, no further formality being necessary in the case of English and Irish warrants to be executed in Scotland, and *vice versa*, than that they should be indorsed by a judge of the territory where they are to be enforced. And by the 6 and 7 Vict. c. 34, provisions are made for the apprehension, in the united kingdom of Great Britain and Ireland, of persons committing treason and felony in her majesty's dominions out of the united kingdom, and *vice versa*, for the apprehension in such dominions of persons offending in England, Ireland, or Scotland. By section 3, offenders may be committed to jail until they can be sent back to the place where the offense was committed; and information of the committal, in writing, under the hand of the committing magistrate, accompanied by a copy of the warrant, is directed to be given, in Great Britain, to one of her majesty's principal secretaries of state, and in Ireland to the chief secretary of the lord-lieutenant; and in any other part of her majesty's dominions, to the governor or acting governor. By section 10, the important enactment is made, that it shall not be lawful to indorse any warrant for the apprehension of an offender under the act, unless it shall appear, upon the face of such warrant itself, that the offense is such, that if committed within that part of her majesty's dominions where the warrant is indorsed, it would have amounted in law to treason, or some felony such as the justices of the peace in general or quarter sessions in England have not authority to try, under the existing acts—by which the jurisdiction of general and quarter sessions is defined—or unless the depositions taken appear sufficient to warrant committal for trial. The effect of this enactment is that the offenses for which criminals may be apprehended, under the 6 and 7 Vict. c. 34, are as follow: Any treason, murder, or capital felony; or any felony which, when committed by a person not previously convicted of felony, is punishable by transportation for life, or for any of the following offenses:

1. Misprision of treason. 2. Offenses against the queen's title, prerogative, person, or government, or against either house of parliament. 3. Offenses subject to the penalties of perjury. 4. Blasphemy, and offenses against religion. 5. Administering or taking unlawful oaths. 6. Perjury and subornation of perjury. 7. Making or suborning any other person to make a false oath, affirmation, or declaration, punishable as

perjury or as a misdemeanor. 8. Forgery. 9. Unlawfully and maliciously setting fire to crops of corn, grain, or pulse, or to any part of a wood, coppice, or plantation of trees, or to any heath, gorse, furze, or fern. 10. Bigamy, and offenses against the laws relating to marriage. 11. Abduction of women and girls. 12. Endeavoring to conceal the birth of a child. 13. Offenses against any provision of the laws relating to bankrupts and insolvents. 14. Composing, printing, or publishing blasphemous, seditious, or defamatory libels. 15. Bribery. 16. Unlawful combinations and conspiracies, except conspiracies or combinations to commit any offense which justices or recorder respectively have or has jurisdiction to try when committed by one person. 17. Stealing, or fraudulently taking, or injuring or destroying records or documents belonging to any court of law or equity, or relating to any proceeding therein. 18. Stealing or fraudulently destroying or concealing wills or testamentary papers, or any document or written instrument being or containing evidence of the title to any real estate, or any interest in lands, tenements, or hereditaments.

In 1870, a statute (amending statutes of 1843, etc., was passed, by which provisions are made for carrying into effect a convention entered into between the British and foreign governments (determinable at pleasure), for the apprehension of offenders in the two countries respectively in cases of murder, forgery, robbery, rape, larceny, embezzlement, obtaining money by false pretenses, burglary, all bankruptcy crimes; frauds by bankers, factors, trustees, directors; abduction, child-stealing, arson, piracy, sinking and destroying vessels at sea, etc. This act gets rid of the former practice of passing a separate act to regulate the extradition of criminals between Great Britain and each country, as nearly all civilized countries have now entered into this kind of confederacy. There is an exception made in favor of fugitive criminals whose surrender is demanded on the ground of offenses of a political character; and the condition of surrender always is, that, when taken back to his own country, he shall not be tried for political offenses.

The law encourages the apprehension of offenders by parties who simply act from a feeling of duty to assist justice. By the 7 Geo IV. c. 64, s. 28 (amended and extended by the 14 and 15 Vict. c. 55), it is provided that when any person shall appear to any court of oyer and terminer, jail delivery, superior criminal court of a county palatine, or any courts of sessions of the peace, to have been active in or towards the apprehension of any person charged with the various crimes contemplated by these statutes, every such court is authorized to order the sheriff of the county to pay to the person or persons who shall appear to the court to have been active in or towards the apprehension of any person charged with any of the said offenses, such sum of money as to the court shall seem reasonable and sufficient to compensate such person or persons for his, her, or their expenses, exertions, and loss of time, in or towards such apprehension; but this power is to be exercised subject to such regulations, as to the rate of allowance, as shall be made from time to time by a principal secretary of state. Provision is also made by the above statutes for compensation to the families of those who lose their lives in attempting to A. persons charged with criminal offenses; but by the latter of these (14 and 15 Vict. c. 55 s. 7) this is not to interfere with the power of the criminal court to order payment to any person who shall have shown extraordinary courage, diligence, or exertion in the apprehension.

It only remains to be added that any willful obstruction of a lawful arrest or apprehension is esteemed an offense of a very aggravated nature. The modern enactments on this subject will be found in the statute passed in 1861 to amend the law of England and Ireland as to offenses against the person, 24 and 25 Vict. c. 100, by which statute it is provided that where any person shall be convicted of any assault upon any police-officer or revenue-officer, in the due execution of his duty, or upon any person acting in aid of such officer, or of any assault upon any person, with intent to resist or prevent the lawful apprehension or detainer of the person so assaulting, or of any other person, for any offense for which he or they may be liable by law to be apprehended or detained; such assault shall be a misdemeanor, punishable with fine, or by imprisonment, with or without hard labor, for any term not exceeding 2 years. By the before-mentioned statute it is enacted that whosoever shall unlawfully and maliciously shoot at any person, or shall, by drawing a trigger, or in any other manner, attempt to discharge any kind of loaded arms at any person, or shall stab, cut, or wound any person, with intent, in any of such cases, to resist or prevent the lawful apprehension or detainer of any person, shall be guilty of felony, and be punishable with penal servitude for life, or not less than 3 years, or with imprisonment, with or without hard labor and solitary confinement, for not more than 2 years. And by the 14 and 15 Vict. c. 19, s. 12, passed for the prevention of offenses at night, any one assaulting a person entitled to A. or detain him, shall be guilty of a misdemeanor, and on conviction, imprisoned, with or without hard labor, for any term not exceeding 3 years.

The same subject is treated in Scotch law-books under the head of *Deforcement*, which Sir Archibald Alison, in his work on the criminal law of Scotland (vol. i. p. 491), says, "consists in the resistance to the officers of justice in the execution of their duty." It is essential to such deforcement that it should be such as to defeat the warrant or other process which authorizes the apprehension. Mere unsuccessful attempts with this view are charged under the name of *resisting and obstructing the officers of the law in the execution of their duty*. See WARRANT OF APPREHENSION.

**APPRENTICE** is a person described in law-books as a species of servant, and called A. from the French verb *apprendre*, to learn, because he is bound by indenture to serve a master for a certain term, receiving in return for his services instruction in, or learning his master's profession, art, or trade; the master, upon the other hand, contracting to instruct the A., and, according to the nature of the agreement, to provide food and clothing for the A., and to pay him small wages. Sometimes a premium is paid by the A., or on his behalf, to the master. By a provision of the 5 Eliz. c. 4, which remained in force until a recent period, it was in general required that every person exercising a trade in England should have previously served as A. to it for 7 years; but by later statutes that provision was abolished, with a saving of the customs and by-laws in London and other corporations; and the term of apprenticeship is now determined by the mutual convenience of the contracting parties. By the municipal act, 5 and 6 Will. IV. c. 76, s. 14 (which does not, however, extend to London), all such customs and by-laws as had the effect of prohibiting trades and occupations to persons who had not served as apprentices, were also done away. Apprentices, in general, are bound out by their friends, though with their own consent, testified by their executing the indentures, without which the transaction is not binding. To the same effect it is the rule of the Scotch law that although a pupil—that is, a boy under 14 or a girl under 12 years of age—may be a party to an indenture as an A., yet he must have the concurrence of a parent or guardian, who alone can be liable to the master for the A.'s non-performance of the engagement. An A., on the other hand, who has passed the years of pupilarity, may effectually enter into an indenture by which he will be personally bound. It has been decided in England that the express assent of an infant A. to the indentures is essential to the contract; and therefore indentures of apprenticeship which had been executed by a father and master, but not by the A. himself, were held invalid. But an infant may bind himself A., because it is for his benefit; for the same reason, however, he cannot himself dissolve the contract. When an A. is bound to two partners, on the death of one of them the apprenticeship is at an end.

There is a class who are bound out by the guardians of the poor, and are called *parish apprentices*, whose binding takes place under different circumstances. For the children of poor persons might formerly, even without becoming parties to the indentures, be apprenticed out by the overseers with the consent of two justices (and may now by the guardians, without such consent), till 21 years of age, to such persons as are thought fitting; and these persons were formerly also compellable to take them. But by 7 and 8 Vict. c. 101, s. 13, the reception of any poor child as an A. is no longer compulsory. A variety of statutes regulate the manner in which parish apprentices are to be bound, assigned, registered, and maintained; a subject which is besides now placed under the paramount control of the local government board, who make new rules, from time to time, as they may think fit; and provisions are made by which the justices of the peace are empowered to settle disputes between such apprentices and their masters, and to discharge the former from their indentures, upon reasonable cause shown. Similar powers belong also to the justices, in the case of apprentices in general. (*Stephen's Commentaries*, vol. ii. p. 240, fourth edition.) It has been decided in England that a corporation cannot make a by-law limiting the number of apprentices which each member shall take, because such a regulation is deemed contrary to the laws of the land.

A mere agreement does not constitute an apprenticeship; there must be regular indentures formally executed. By statute 33 and 34 Vict. c. 97, indentures of apprenticeship in which the full sum or sums of money received, given, paid, secured, or contracted for, are not truly inserted, are void. But the act does not apply to cases where the sum is inserted in the indentures, though it is a less sum than that which was originally agreed for, and the reduction made to diminish the amount of the stamp-duty.

In the performance of the contract, a reasonable and equitable view is taken of the relative position of the parties. The master is not bound to the literal and uniform instruction of the A. by himself personally, but under his own superintendence, and by his own directions, he may avail himself of the assistance of journeymen, or other persons serving in his place of business, and even of other apprentices—the object of the agreement being that the A. shall have the full benefit of all the master's arrangements in practicing his art, craft, or trade. The A., on the other hand, although in the position of a servant to some extent, is not bound to serve as such, but may rather be said to be placed under the parental control of the master; and perhaps the master may correct the A.'s faults and disobedience by moderate chastisement, if the A. is still under age; nor can he discharge the A. To that end, the master, under an unrepealed enactment of the 5 Eliz. c. 4, must complain to the justices, who decide whether the A. has merited his dismissal or not; the A., however, having a corresponding privilege in the case of his complaint against his master. But, by the Scotch law, a master can dismiss his A. in the case of his proving "incorrigible." By the custom of the city of London, a freeman may turn away his A. for *gaming*.

It was decided by the house of lords, on an appeal from Scotland in 1837, and reversing the decision of the court of session, that a barber's A., whose indentures bound him "not to absent himself from his master's business, holiday or week-day, late hours or early, without leave first asked and obtained," could not be lawfully required

to attend his master's shop on Sunday mornings for the purpose of shaving customers, because such employment was a violation of the old Scotch statutes still in operation, and which were enacted for enforcing the observance of the Sunday, particularly one passed in 1559, by which it is provided "that na handy lauboring or winking be used on the Sondag." The lord chancellor (lord Cottenham) observed in his judgment that the English law on this subject was very similar, referring in particular to the 29 Charles II. c. 7, by which it is enacted "that no tradesman, artificer, workman, laborer, or other person whatsoever shall do or exercise any worldly labor, business, or work, of their ordinary callings, upon the Lord's day, or any part thereof, works of necessity and charity only excepted."

An A.'s indenture is determinable by the consent of all the parties to it; and also by the death of the master. But the executor of the latter may bind the A., to another master if the contract so provide; and he must also discharge any covenant or agreement for the A.'s maintenance, so far as he has assets. By the custom of London, if the master of an A. die, the service must be continued with the widow, if she continue to carry on the trade. In other cases, it is incumbent on the executor to put the A. to another master of the same trade. The bankruptcy of the master operates as a discharge of the indenture of the A., who, if he has paid an A. fee to the bankrupt, is entitled to be paid by the court a reasonable sum out of the estate.

By the mutiny act, apprentices enlisting in the army, and concealing their apprenticeship when brought before a magistrate to be attested, may be indicted for obtaining money under *false pretenses*; and if, after the expiration of their apprenticeship, they do not surrender to a recruiting officer, they may be apprehended as deserters.

There is some curious historical matter on this subject, relating for the most part to a state of the law now obsolete or repealed, for which see Knight's *Political Dictionary*, under this head.

**APPRENTICE** (*ante*). In the United States the system of apprenticeship has largely gone out of use in recent years, and regular indentures and serving of time are now little heeded; but there are laws regulating the business in most of the states. The New York statutes—which may be taken as generally resembling those in many other states—provide that males under 18 and unmarried females under that age may, with consent of natural or legal guardians, or of their own motion, bind themselves as A., but for no longer than until they become of age (males at 21, and females at 18). Consent comes from father, mother, guardian, overseers of the poor, or officers legally qualified, such as the commissioners of charity and correction. Consent of the mother must be had in writing if she be living and not incapacitated. Regular indentures are provided, and specific agreements must be made by both parties, the main provisions of which are that the A. shall serve the term specified; if he run away he may be compelled to return; the master shall provide proper support and medical service; shall teach or cause to be taught the business intended; and give a certificate of full service of the term. Indentures are canceled or annulled only by death, or legal process. An absconding A. may be arrested, and on refusing to return may be sent to the house of correction or jail; or, if the A. willfully refuse to perform his portion of the contract, the agreement may be canceled, the A. forfeiting all claims. On the other hand, neglect, cruel treatment, or refusal to instruct on the part of the master, may be punished by damages, by canceling indentures, or by fine for the benefit of the A. or his parent or guardian. Managers of asylums or homes for indigent children usually have power to bind out. Indentures always require the master to provide a certain amount of education, and imply freedom in religious opinion and choice of church. There is a special section which declares that no person shall accept from any A. or journeyman any agreement, or cause him to be bound by oath, or in any manner, that after his term expires, he will not exercise his trade in any particular place or manner; nor shall any one take money or value from an A. for permitting him to use his trade in any place.

**APPRISING** is the old technical term in the Scotch law, and now obsolete, for the process of adjudication. See **ADJUDICATION**.

**APPROACHES**, in military language, are the sunken trenches or excavated roads which are constructed by besiegers. The siege camp being usually at a considerable distance from the fortress or city attacked, the soldiers would be exposed to imminent danger while hastening across a belt of open country to enter any breaches made by the large siege guns, were it not that concealed roads are first constructed along which they may approach. In some cases the A. are not actual trenches, but merely paths shielded by a piled-up wall of sand-bags, fascines, gabions, woolpacks, or cotton-bales. The most tremendous combination of A. ever known in the history of military enterprise was at the siege of Sebastopol in 1854-5; it comprised the digging of no less than 70 miles of sunken trench, and the employment of 60,000 fascines, 80,000 gabions, and 1,000,000 sand-bags, to protect the men working in the trenches and at batteries. See **SAP**, **SIEGE**.

**APPROBATE** and **REPROBATE**. This is a technical expression in the law of Scotland, which signifies one of those rules of justice which commend themselves by their reasonable logic, and which are to be found in all enlightened systems of jurisprudence. It simply means that no one can be permitted to A. and R.—that is, to accept and reject the same deed or instrument. Thus, if a will or settlement, purporting to

dispose of real and personal property, all of which it directs to be converted into money, and in that form either to be equally divided or apportioned among the testator's children, consisting of a son or sons, and daughters, should, owing to some flaw or material defect, be invalid for the conveyance of the real estate, which, accordingly, by the operation of the law of descent, becomes the exclusive property of the eldest son as his father's heir, the law does not permit the latter to enjoy such estate, and at the same time to take benefit under the will in other respects, for this would be simultaneously to accept and reject the same instrument: he must elect between the two alternatives, and either avail himself entirely of his rights at law, as heir, or claim his share of the whole estate according to the testator's manifest intention—he cannot do both. Other illustrations might be given, showing distinctions too nice perhaps for popular information. The analogous doctrine in the law of England is called election (q.v.). In one case decided by the house of lords in 1819, the lord chancellor Eldon treated the rule in the Scotch and English legal systems as identical, observing that it was equally settled in Scotland as in England that no person can accept and reject the same instrument; and he puts the case of a testator giving his estate to A., but also giving the estate to which A. would otherwise have been entitled, to B.; in that case his lordship stated that courts of equity hold it to be against conscience that A. should take the estate bequeathed to him, and at the same time refuse to effectuate the implied condition contained in the will of the testator. The court will not permit him to take that which cannot be his but by virtue of the disposition of the will, and at the same time to keep what, by the same will, is given, or intended to be given, to another person. It is contrary to the established principles of equity that he should enjoy the benefit while he rejects the condition of the gift.

It is chiefly in the case of wills and other testamentary dispositions that this legal doctrine most frequently arises in practice, although there can be no question that both in the English and Scotch systems of law it extends to all other writings, deeds, and instruments.

**APPROPRIATION CLAUSES, THE.** This was the name by which, while the discussion continued, reference was usually made to an important question which occupied a large share of the attention of the legislature and of the public between the years 1833 and 1838. The expectation that the state of Ireland would improve after the passing of the Catholic emancipation and reform acts, had turned out to be fallacious. Among other grave causes of complaint left untouched by these measures, was the collection of tithes by the Established church, and from that cause proceeded very many of the evils with which Ireland was then afflicted. To such an extent was the antipathy to tithes carried, that a clergyman who ventured to exact payment by legal measures in the exclusively Catholic counties, did so at the risk of his life. Several clergymen had actually been assassinated, and others were so unpopular that the utility of the Irish church in three-fourths of Ireland was almost destroyed. This was a state of matters which could not be permitted to last. Coercive measures had been tried, and had failed to produce any amelioration. The remedies which then suggested themselves were three: First, the commutation of tithes into a rent-charge upon land; second, the reduction of the number of sinecures in the Irish Protestant church; and third, the appropriation of the surplus revenues of that church to the advancement of the general education of the people.

The first of these measures the liberal cabinet of 1833 attempted, but—from leaving the commutation to take place at the option of the landlord—carried into effect in a manner so unsatisfactory, that no good whatever resulted. The second was carried out with more success. The Irish church temporalities act struck off two archbishoprics, ten bishoprics, and various sinecures, and applied the revenues thus acquired chiefly to supply the place of an impost called “vestry cess” (analogous to church-rates), which was abolished. This act, however, still left the church with an income greatly disproportioned to the number of her adherents. The cabinet was divided in regard to the third measure, a majority being in favor of the principle of appropriation, and a minority, consisting of the Irish secretary, Mr. Stanley (afterwards earl of Derby), Sir James Graham, lord Ripon, and another, being opposed to it. The minority had influence enough to prevent government from espousing the principle, and even to procure the abandonment of the 147th clause of the church temporalities bill, because the opposition asserted, though incorrectly, that it virtually embodied the principle. This was the first of the A. C.

In the following year, 1834, it had become fully apparent that the tithe act of 1833 had failed, and the state of Ireland rendered it more imperative than ever to settle the tithe question. Mr. Ward, throughout a steady supporter of the principle of appropriation, moved in the house of commons, on 27th May, 1834, “that it was right that the state should regulate the distribution of church property in such a manner as parliament might determine.” This raised the whole question of appropriation, and that greatly to the annoyance of ministers. The split in the cabinet was well known not to have been healed, and while Mr. Ward was speaking, news reached lord Althorp that the minority had resigned. This stopped the debate for the night. The ministers left in office found themselves relieved of a portion of their difficulties, but as they were aware that the king was strongly opposed to the appropriation principle, and that there was no prospect of

the house of lords assenting to it, they were most anxious to find some means to delay committing themselves in the matter. A commission was accordingly appointed to collect information; and on June 2d, lord Althorp met the commons, impressed on them how useless it was to discuss a mere abstract principle, and on Mr. Ward's refusing to withdraw his motion, moved and carried the previous question by a large majority.

The short-lived ministry of 1835, under Sir Robert Peel, was in office when the appropriation question next came before parliament. The liberals were in opposition; and lord John Russell, who had succeeded to the whig leadership in the commons, on lord Althorp's removal to the house of lords, was now prepared to commit his party to the appropriation principle. When Sir Robert Peel brought forward a tithe commutation bill to supplement the bungled measure of 1833, lord John Russell proposed two resolutions, which gave rise to one of the longest and most important of the numerous debates which have taken place on the question. On the one side the chief speakers were Ward, lord Howick, Sheil, and O'Connell; and on the other, Peel, Stanley, Sir James Graham, and Gladstone. Much of the interest which attended the discussion was caused by its involving the whole question of church establishments, and by a fear, on the part of the English conservatives, that the doctrines of utility and expediency, so freely referred to in connection with the church of Ireland, might one day be turned against the church of England. On 2d April, 1835, the house of commons pronounced, by a majority of 33, "that any surplus which might remain, after fully providing for the spiritual instruction of the members of the established church of Ireland, ought to be applied to the moral and religious education of all classes, without distinction of religious persuasion;" and a few days afterwards, a subsequent resolution was passed, "That no settlement of the tithe question would be satisfactory unless it embodied the preceding principle." In consequence of these resolutions, the conservatives resigned, and the liberals returned to power.

There was now in office a ministry pledged to the appropriation principle. In 1836, ministers brought forward a tithe commutation bill, containing clauses carrying out the principle fully and explicitly. The bill passed the commons, but the A. C. were struck out by the lords. The bill was thereupon abandoned. In 1837, a government tithe commutation bill again passed the commons with A. C., and again these clauses were struck out by the lords. On the motion of the ministers, the commons rejected the amended bill. After the general election of 1837, the Melbourne ministry found themselves with a very narrow majority in the commons. The liberal members had made the appropriation question a prominent topic at the election; but it was too apparent that England and Scotland were becoming weary of the interminable discussions upon Irish affairs. In the meantime, the state of Ireland was little better, and with an increasing party in the house of commons to back them, there was no prospect of the lords giving way upon the appropriation question. Still, it was necessary that something should be done, and the choice of the ministry lay between carrying a commutation bill without A. C., and resignation. The former course was chosen. The tithe measure was introduced, and ministers solaced themselves for their desertion of principle by the reflection that after all there might be no surplus to appropriate, and that it would therefore be useless to prolong a collision with the upper house on a matter of no practical importance. This conduct emboldened the opposition, and Sir Thomas Acland, on 14th May, 1838, moved the recall of the celebrated resolutions of 1835. The discussion which followed was most damaging to the credit of the ministers, but they were saved, by a majority of 19, from the humiliation of having the resolutions recalled. A last effort in support of the principle was made in July, 1838, by Mr. Ward, who then moved the insertion of A. C. into the government tithe bill. He was opposed by the whole ministerial force, and, more strangely still, by the Irish members. O'Connell, who in 1835 had spoken of the one magical word "appropriation," which was to bring peace to Ireland, declared now that nothing would satisfy the Irish people except the total abolition of tithes. Thus deserted and opposed, Mr. Ward's motion was lost by a large majority. The government tithe measure passed in Aug., 1838, and tithes were commuted into a rent-charge of three fourths of their amount. After that, they were collected with comparative facility, and the appropriation question, once the topic of discussion over the whole country, fell into oblivion, until the disendowment of the Episcopal church in Ireland, in 1869, revived it in a new shape.

**APPROVER**, or **PROVER**, in the law of England, is a person who had been an accomplice in the perpetration of a crime, but who is admitted to give evidence against the prisoner. It had not so simple and intelligible a meaning in the ancient practice of the criminal law, in which *approvement* was a kind of confession of a complicated nature. Where a person in a prosecution for treason or felony confessed the fact before pleading to the indictment, and, at the same time, accused others, his accomplices, of the same crime, in order to obtain his pardon, he was called an *A.* or *P.* But as the condition of the pardon he thus expected was the conviction of the accomplice he accused, if that failed, the *A.* received judgment of death upon his own confession. If, on the other hand, the accused accomplice was found guilty, the *A.* was entitled to his pardon *ex debito justitiæ*. But "this course of admitting approvements," says Blackstone, writing about a century ago, "hath long been disused; for the truth was, as Sir Matthew Hale

observes, that more mischief arose to good men by these kinds of approvements, upon false and malicious accusations of desperate villains, than benefit to the public by the discovery and conviction of real offenders; and, therefore, in the times when such appeals were most frequently admitted, great strictness and nicety were held therein; though, since their discontinuance, the doctrine of approvements is become a matter of more curiosity than use."

The modern practice is to admit accomplices to give evidence for the prosecution, or, as it is said, to become *queen's evidence*, upon an implied promise of pardon, on condition of their making a full and fair confession of the whole truth. The admission, however, of an accomplice to give evidence against his fellows, requires the previous sanction of the judges of jail delivery, and a motion is usually made at the trial to the judge for leave to admit the accomplice for that purpose. The testimony of an accomplice is in all cases, however, regarded with just suspicion; and unless his statement is corroborated in some material part by unimpeachable evidence, the jury are usually advised by the judge to acquit the prisoner; and if the accomplice, after having confessed the crime, and being admitted as *queen's evidence*, does not satisfy the condition on which he was so received by failing to give full information without equivocation, reservation, or fraud, he then forfeits all claim to protection, and may be tried, convicted, and punished on his own confession. Accordingly, upon a trial at York, towards the commencement of the present century, before the late Mr. Justice Buller, the accomplice denied in his evidence all that he had before confessed, upon which the prisoner was acquitted. But the judge ordered an indictment to be preferred against the accomplice for the same crime, and on his previous confession, and other circumstances, he was convicted and executed.

The term in the law of Scotland analogous to that of A. is *socius criminis*, and the principles on which such socius is admitted, and on which his evidence is left to the jury, are the same as in England. But the criminal courts in Scotland go further in protecting and assuring safety to the approver than the English practice does. Sir Archibald Alison, in his *Practice of the Criminal Law of Scotland*, vol. ii., p. 453, says: "It has long been an established principle in our law, that by the very act of calling the *socius*, and putting him in the box, the prosecutor debars himself from all title to molest him for the future with relation to the matter libeled. This is always explained to the witness by the presiding judge as soon as he appears in court, and consequently he gives his testimony under a feeling of absolute security as to the effect which it may have upon himself. If, therefore, on any future occasion the witness should be subjected to a prosecution on account of any of the matters contained in the libel on which he was examined, the proceedings would be at once quashed by the supreme court. This privilege is absolute, and altogether independent of the prevarication or unwillingness with which the witness may give his testimony. Justice, indeed, may often be defeated by a witness retracting his previous disclosures, or refusing to make any confession after he is put into the box; but it would be much more put in hazard if the witness was sensible that his future safety depended upon the extent to which he spoke out against his associate at the bar. The only remedy, therefore, in such a case, is committal of the witness for contempt or prevarication, or indicting him for perjury, if there are sufficient grounds for any of these proceedings. In this respect the security of the *socius*, and the safeguard against the contamination of the sources of evidence, is much stronger in this country than in England, where it is held that the circumstance of having been adduced by the crown is not a bar to trial, but only the foundation for a recommendation to the crown for mercy, and is entirely dependent on the witnesses making a full and fair disclosure." And Sir Archibald mentions a case where a soldier, who was adduced as an A. or *socius*, and who was under confinement as a military delinquent for the same offense, was nevertheless allowed to give evidence; and upon its being suggested as an objection to the soldier's being admitted as a witness, that he would still be open to be tried by a court-martial, the court declared that they had the power to protect him from such an ordeal, and that they would not fail to interfere on his behalf, if he were in any way endangered in consequence of his evidence.

It was chiefly on the evidence of an accomplice named William Hare, that Burke the notorious criminal was convicted before the high court of justiciary in 1828. See this case noticed previously in ANATOMY.

**APPROXIMATION**, a term commonly used in mathematical science to designate such calculations as are not rigorously correct, but approach the truth near enough for a given purpose. Thus in logarithmic and trigonometrical tables nearly all the numbers are mere approximations to the truth. The calculations of astronomy generally are of this nature. Even in pure mathematics there are parts in which approaches to the truth, by means of interminable series, are all we are able to gain. The solution of equations beyond the fourth degree can be got only by approximation.

**APPUI** (French), a stay or support. In military tactics, the *points d'A.* are such parts of the field of battle as are suited to give support or shelter. As the wings of an army (like the extreme sides of a chess-board) are the weakest points of resistance to attack, they especially require support or protection, and are placed, when it is possible, in

localities which serve to obstruct the attacking forces. Lakes, morasses, woods, streams, and steep declivities may thus serve as *points d'A*.

**APPULETUS**, or, less properly, **APULEIUS**, a satirical writer of the 2d c., was b. at Madaura, in Africa, where his father was a magistrate, and a man of large fortune. A. first studied at Carthage, which at that time enjoyed a high reputation as a school of literature. Afterwards he went to Athens, where he entered keenly upon the study of philosophy, displaying a special predilection for the Platonic school. The fortune bequeathed to him at his father's death enabled A. to travel extensively. He visited Italy, Asia etc., and was initiated into numerous religious mysteries. The knowledge which he thus acquired of the priestly fraternities, he made abundant use of afterwards in his *Golden Ass*. His first appearance in literature arose from a lawsuit. Having married a middle-aged lady, named Pudentilla, very wealthy, but not particularly handsome, he drew down upon his head the malice of her relations, who desired to inherit her riches, and who accused the youth of having employed magic to gain her affections. His defense (*Apologia*, still extant), spoken before Claudius Maximus, proconsul of Africa, was an eloquent and successful vindication of his conduct. After this event, his life appears to have been devoted zealously to literature and public oratory, in both of which he attained great eminence. He was so extremely popular, that the senate of Carthage, and other states, erected statues in his honor.

The *Golden Ass*, the work by which his reputation has survived, is a romance or novel, whose principal personage is one *Lucian*, supposed by some, though on insufficient evidence, to be the author himself. It is generally understood to have been intended as a satire on the vices of the age, especially those of the priesthood, and of quacks or jugglers affecting supernatural powers, though bishop Warburton, and other critics, fancy they can detect in it an indirect apology for paganism. Its merits are both great and conspicuous, as are also its faults. Wit, humor, satire, fancy, learning, and even poetic eloquence abound, but the style is disfigured by excessive archaisms, and there is a frequent affectation in the metaphors, etc., which proves A. to have been somewhat artificial in his rhetoric. The most exquisite thing in the whole work is the episode of Cupid and Psyche (imitated by La Fontaine). It is supposed to be an allegory of the progress of the soul to perfection. Besides the *Apologia* and *Golden Ass*, we have from the pen of A. an anthology in four books, a work on the Dæmon of Socrates, one on the doctrines of Plato, one on *The Universe*, etc. A considerable number of his works also are lost. The most recent and careful edition of the whole works of A. is that published at Leipsic in 1842, by G. F. Hildebrand. The *Golden Ass* was translated into English by T. Taylor (1822), and again by Sir G. Head (1851). An English version of the works of A. was published in London, 1853.

**APPURTENANCES**, things belonging to another thing as principal, and which pass as incident to the principal thing. Thus in the conveyance of a house and land, everything passes which is necessary to the full enjoyment thereof; and in such case the term includes the right of way, etc. In general it means anything necessary to the full possession and enjoyment of the principal thing. In case of a ship, the usual furniture and things necessary for using the vessel are A.; the boats, sails, anchors, etc.; but it has been held that ballast was not appurtenant.

**APRAXIN**, **STEFAN FEDOROVITCH**, 1702-58; a Russian general. In his youth he served against the Turks, gaining rapid promotion. In Elizabeth's court he was a strong opponent of Prussian influence, and in the seven years' war led an army against Frederick the great, invading Prussia, and capturing Memel. In the midst of success he retreated, and joined the conspiracy to raise Paul to the Russian throne over his father, who was the legitimate heir. He was tried by a court-martial, but died in prison before the end of the cause.

**APRAXIN**, **THEODOR MATVAYEVICH**, a distinguished Russian admiral, was b. in 1671. When hardly 12 years of age, he entered the service of Peter the great, who conceived a great attachment for him, which lasted during the whole life of the monarch. In 1699, he took part in the first maneuvers of the Russian fleet at Taganrog on the sea of Azof. After the year 1700, he became the most powerful and influential person at the court of the czar, who made him chief-admiral of the Russian navy, of which, in fact, A. may be considered the creator. While Peter was fighting the Swedes in the north, A. was building war-vessels, fortresses, and wharves in the south. In 1707, he was appointed president of the admiralty; in 1708, he defeated the Swedish general, Lülbecker, in Ingermanland, and saved the newly-built city of Petersburg from destruction; in 1710, he captured the important t. of Viborg, in Finland; and in 1711, commanded in the Black sea during the Turkish war. The following year he returned to the north; and in 1713, with a fleet of 200 vessels, he sailed along the coast of Finland, took Helsingfors and Borgo, and defeated the Swedish fleet. The result of his great successes was that at the peace of Nystadt, in 1721, Russia obtained some most valuable advantages, being confirmed in her possession of Finland, just conquered, and of Esthonia. In spite of his brilliant reputation, however, he twice suffered an apparent eclipse of imperial favor. In 1714-15, he was charged with embezzlement, tried, and condemned to pay a fine; and a few years later, was denounced by Peter himself as "an oppressor of the people," and again condemned to pay a fine; but his services were too useful to be dispensed with.

and in both instances the czar neutralized the effect of the condemnation, by conferring upon him additional richness and dignities. In 1722, he accompanied Peter in his Persian war, and was present at the siege of Derbend. His last naval expedition was in 1726, when he repaired with the Russian fleet to Revel, to defend that place against an expected attack by the English. He d. at Moscow, 10th Nov., 1728, in the 57th year of his age.

**APRICOT**, *Prunus armeniaca*, a species of the same genus with the plum (q.v.), is a native of Armenia, and of the countries eastward to China and Japan; a middle-sized tree of 15 to 20 or even 30 ft. high, with ovate, acuminate, and cordate, smooth, doubly-toothed leaves on long stalks; solitary, sessile, white flowers, which appear before the leaves, and fruit resembling the peach, roundish, downy, yellow, and ruddy on the side next the sun, with yellow flesh. The A. was brought into Europe in the time of Alexander the great, and since the days of the Romans has been diffused over all its western countries. It has been cultivated in England since the middle of the 16th century. It is only in the s. of England that it is ever trained as a standard, nor is it grown in the more northern parts, even as an espalier, but almost always as a wall-tree. More than 20 kinds are distinguished, amongst which some excel very much in size, fine color, sweetness, and abundance of juice. The *Moorpark* is generally esteemed the finest variety, and the *Breda* as best suited for standards in the s. of England, and in Scotland even for the wall, except in the most favorable situations.—The A. is generally budded on plum or wild cherry stocks. The fruit keeps only for a very short time, and is either eaten fresh, or made into a preserve or jelly. Apricots split up, having the stone taken out, and dried, are brought from Italy as an article of commerce, in particular from Trieste, Genoa, and Leghorn; in the s. of France, also, they are an article of export in a preserved and candied state. Dried apricots from Bokhara are sold in the towns of Russia, the kernels of which are perfectly sweet, like those of the sweet almond. The kernels are sweet in some kinds, and bitter in others—the bitterness being probably more natural, and the sweetness, as in the almond, the result of cultivation. Generally speaking, they may be used for the same purposes as almonds. From the bitter kernels, which contain prussic acid, the *eau de noyau* is distilled in France. The charred stones yield a black pigment similar to Indian ink. The wood of the tree is good only for the purposes of the turner.

The **BRIANÇON A.**, *Prunus brigantiaca*, very much resembles the common A. The fruit is glabrous. It is found in Dauphiné and Piedmont. At Briançon, an oil, called *huile de marmotte*, is expressed from the seeds.

The **SIBERIAN A.**, *P. sibirica*, is also very like the common A., but smaller in all its parts. The fruit is small. It is a native of Siberia, especially of the southern slopes of the mountains of Dahuria.

The A. plum is an excellent kind of plum, much cultivated in some parts of France, and which, preserved in sugar, dried, and packed in shallow boxes, forms a considerable article of trade.

**A'PRIES**, king of Egypt, the Pharaoh-Hophra of the time of Zedekiah and Nebuchadnezzar. He invaded Syria, but gained no substantial advantages. Herodotus says he was so vain and confident of his power that he would not believe that even a deity could overcome him. His fall was predicted by Jeremiah (xlv. 30), and it came through the revolt of his troops, who took Amasis for their leader, and made A. a prisoner, 569 B.C. Amasis saved his life for a time, but was compelled to give him over to his enemies, who strangled him.

**A'PRIL**. The Romans gave this month the name of *Aprilis*, from *aperire*, to open, because it was the season when the buds began to open; by the Anglo-Saxons it was called Ooster, or Easter-month; and by the Dutch, Grass-month. The custom of sending one upon a bootless errand on the first day of this month, is perhaps a travesty of the sending hither and thither of the Savior from Annas to Caiaphas, and from Pilate to Herod, because during the middle ages this scene in Christ's life was made the subject of a miracle-play (q.v.) at Easter, which occurs in the month of A. It is possible, however, that it may be a relic of some old heathen festival. The custom, whatever be its origin, of playing off little tricks on this day, whereby ridicule may be fixed upon unguarded individuals, appears to be universal throughout Europe. In France, one thus imposed upon is called *un poisson d'Avril* (an A. fish). In England, such a person is called an A. fool; in Scotland, a gowk. Gowk is the Scotch for the cuckoo, and also signifies a foolish person. The favorite jest in Britain is to send one upon an errand for something grossly nonsensical—as for pigeon's milk, or the history of Adam's grandfather; or to make appointments which are not to be kept; or to call to a passer-by that his latchet is unloosed, or that there is a spot of mud upon his face. When he falls into the snare, the term A. fool or gowk is applied with a shout of laughter. It is curious that the Hindoos practice precisely similar tricks on the 31st of March, when they hold what is called the Huli festival.

**A-PRIORI** reasoning or demonstration is that which rests on general notions or ideas, and is independent of experience. Reasoning from experience is called *a-posteriori* reasoning. A predilection for one or the other of these forms of reasoning forms one of the most important distinctions among schools of philosophy. Plato may be taken as

typical of the A-P. school, Locke and Bacon of the other. A-P. speculation is more in accordance with the genius of the Germans than with that of the practical British. A-P. philosophy claims for its conclusions the character of necessary truths, and denies that there can be A-P. proof of anything, that kind of reasoning furnishing only a confirmation or verification. The opposite school maintain that the general notions or principles on which A-P. reasoning rests, are themselves the results of experience, and that, therefore, all truth rests really on A-P. grounds.

**APRON.** This word is employed both in military and in shipping affairs. The A. of a cannon is a piece of sheet-lead which covers the touch-hole, tied by two pieces of white rope. In ship-building, the A. is a piece of curved timber fixed behind the lower part of the stem, and just above the foremost end of the keel; its chief use is to fortify the stem, and connect it more firmly with the keel. The name of A. is also given to the plank-flooring raised at the entrance of a dock, a little higher than the bottom, to form an abutment against which the gates may shut.

**APSE** (Lat. *apsis*), a semicircular recess usually placed at the east end of a choir or chancel of a romanesque, or what is commonly called in England an Anglo-Saxon or Anglo-Norman church. The origin of this peculiar termination to the choir is so curious, and has been so clearly established by recent German writers, that we shall endeavor to state it in a very few words. It is well known that the heathen structure from which the early Christians borrowed the form of their churches was not the temple, but the basilica or public hall which served at once for a market-place and a court of justice. The Basilica, for the most part, was a parallelogram, at one of the shorter sides of which, opposite to the entrance, there was a raised platform destined for the accommodation of the persons engaged in and connected with the distribution of justice. This portion of the building was the prototype of the rounded choir, to which the name of A. was given, and which is still to be seen in so many of the Rhenish churches. For the prætor's chair, which was placed in the center of this semicircular space, the altar was substituted; and the steps which led to the seat from which he dispensed justice, were destined henceforth to lead to the spot where the fountain of all justice should be worshiped. Many A.'s are to be met with in English churches, an enumeration of which will be found in Mr. Parker's excellent glossary of architecture. But as the structure is not only much more frequent, but continued to be used to a much later period on the continent, we shall describe it as it may still be seen in almost every little village along the banks of the Rhine. The lower part of the A. is there usually pierced by two or three round arched windows, often of irregular size and height, over which there is invariably an external gallery supported by pillars, in the form of which the rude idea of a Roman pillar is at once apparent; and the whole is joined to the end of the nave, which rises considerably above it, by a roof in the form of the segment of a cone. Where the churches are larger, there is a complete row of windows of the same rounded form, divided by pillars similar to those by which the gallery is supported, and under them frequently a line of arches of corresponding construction, whilst one or two small and irregular holes of the same form give a scanty light to the crypt beneath. Many of the smaller churches have no aisles; and the semicircular A. forms the termination of, or rather contains the chancel. The more complete specimens of the style, however, such as the minster at Bonn, afford—with the exception of the transepts and the towers, which are later additions—about the most perfect examples to be found on this side the Alps of the form of the Roman basilica, as first adapted to Christian uses. Several examples of the A. are to be seen in the earlier ecclesiastical structures of Scotland; as instances, we may mention the churches of Dalmeny and Kirkliston in Linlithgowshire, and of Leuchars in Fife.

**AP SIDES** (Gr. *apsis*, connection), the two extreme points in the orbit of a planet—one at the greatest, the other at the least distance from the sun. The term A. is also applied in the same manner to the two points in the orbit of a satellite—one nearest to, the other furthest from, its primary; corresponding, in the case of the moon, to the perigee and apogee. A right line connecting these extreme points is called the line of A. In all the planetary orbits, this line has no fixed position in space, but makes a forward motion in the plane of the orbit, except in the case of the planet Venus, where the motion is retrograding. This fact in the orbit of the earth gives rise to the anomalistic year (q.v.). This advancing motion of the line of A. is especially remarkable in the orbit of the moon, where it amounts to  $40^{\circ} 40' 32''.2$  annually, an entire revolution thus taking place in rather less than nine years.

**APSLEY**, a river of Australia, in the n. division of New South Wales. It is a tributary of the river Macleay (formerly sometimes called A.), which reaches the Pacific at Trial bay, 30 m. n. of Port Macquarie.—A. is also a strait between Melville and Bathurst islands, on the n. coast of Australia. Its length is 48 m., with a width varying from  $1\frac{1}{2}$  to 4; and the depth of its channel is from 8 to 24 fathoms.

**AP'TERAL**, applied to temples of the Greeks and Romans which had no lateral columns, though there may have been columns at the ends.

**APTEROUS INSECTS** are insects without wings. In the Linnæan system, the *aptera* form an order of insects; but more important distinctive characters being found to

belong to the insects included in it, it is no longer retained as an order or principal division in the most improved entomological systems.

**APTERYX** (from the Gr. *a*, priv., and *pteryx*, a wing), a genus of birds allied to the ostrich and emu, and perhaps more nearly to the extinct dodo. It has a very long and slender bill, of which it makes a remarkable use in supporting itself when it rests. It has three anterior toes, and a posterior one which is scarcely developed. The legs are of moderate length, the wings merely rudimentary. The feathers have no accessory plume. The diaphragm is more complete than in any other known bird. Only one species is known (*A. australis*), about the size of a goose, a native of New Zealand. It is a nocturnal bird, and preys on snails, insects, etc. It is much prized for its feathers. The natives call it *kivi-kivi*, from its cry.

**APTHE** are small vesicles formed of the superficial layer of a mucous membrane, elevated by fluid secreted by the latter. They are usually whitish in color, and the fluid may be serous or puriform. At the end of a few hours or days, the apthous vesicle bursts at its summit, and shrivels up, exposing an inflamed and painful patch of the mucous membrane. The most common site of A. is the mucous membrane of the lips and mouth, but they occasionally appear wherever mucous membrane approaches the skin. Infants are liable to an apthous eruption termed *thrush* (q.v.). A. in adults are generally the consequences of fevers and other diseases, or a symptom of disturbance of the digestive system. In some cases of pulmonary consumption, they form a painful addition to the patient's sufferings. In ordinary cases of A., a preparation of borax, or some astringent wash, generally effects a rapid cure.

**APULIA**, a part of ancient Iapygia (so named after Iapix, son of Dædalus), now includes the south-eastern part of Italy as far as the promontory of Leuca, and also the extreme peninsula of Calabria. Here, in ancient times, lived three distinct peoples—the Messapians or Salentini, the Peuceni, and the Daunians or Apulians. According to old Latin traditions, Daunus, king of the Apulians, when banished from Illyria, settled in these parts of Italy. Later traditions say that Diomedes, the Ætolian, with several other heroes returning from the Trojan war, came to Italy, and, in his war with the Messapians, was assisted by Daunus, but was afterwards deprived of his territory, and put to death. Roman poetry has preserved these old names; but in history, no mention is made of any king of A., though we find the names of its principal cities—Arpi, Luceria, and Canusium. The second Punic war was for some time carried on in A. In the present day, A. (now styled **PUGLIA**) is merely the name of a geographical district, and has no political meaning. The whole territory, including the Neapolitan provinces, Capitanata, Terra di Bari, Terra d'Otranto, etc., is but a shadow of its former self, in the time of the Greek colonies, under Roman dominion, or even under the Normans, who took possession of it in 1043 A.D. The towns are depopulated, industry has disappeared, and commerce, once so flourishing, has passed away. Agriculture is in a very low condition, and the few roads are infested by banditti. The people are generally ignorant and superstitious, but deserve praise for their hospitality to travelers.

**APURE**, a river of the United States of Colombia and Venezuela, which rises in the e. Andes, near lat. 7° n., and long. 73° w. After receiving the Portuguesa and the Guarico from the n., it joins the Orinoco in lat. 7° 40' n., and long. 63° 45' w. It waters the towns Nutrias and San Fernando.

**APURE**, a province in s. Venezuela, bordering on Colombia and Guiana; 22,250 sq. m.; pop. 32,485. Capital, San Fernando de A.

**APURIMAC**, a river of Peru, which, after a course of 500 m., assumes the name, first, of Tambo, and then of Ucayali, which finally joins the Tangaragua to form the Amazon. The A. proper rises to the n.w. of the great table-land of lake Titicaca, receiving from it, however, no portion of its waters. Among the tributaries of the Amazon, it is one of the most southerly; while among them, it approaches perhaps the nearest to the Pacific. The A., from its source in lat. 16° s., drains the eastern face of the Andes through about 5°, till it changes its name, as above, in 10° 45' s., meanwhile receiving several considerable affluents, more especially the Vilcamayo, from the opposite quarter. The A. and its feeders partake of the nature rather of mountain torrents than of navigable rivers; and even for traveling by land, their rocky and rugged banks are always difficult, and often impracticable. The valleys vary in climate and productiveness according to their elevation. The upper ones yield wheat and barley, and most of the fruits of Europe; while the lower, or at least the lowest ones, abound in sugar and cotton, plantains, and pine-apples. The basin of the A., as a whole, is said to be the finest part of Peru, and to contain the largest proportion of native population—the best specimens apparently of the aboriginal civilization.

**AQUA** (water), a compound of oxygen and hydrogen, symbol H<sub>2</sub>O. The prefix A. was much used by alchemists; *A. fortis*, strong water, is nitric acid; *A. regia*, royal water, a compound usually containing one part of nitric acid with two of hydrochloric, which dissolves gold; *A. vite*, water of life, strong drink, or alcohol. In modern pharmacy we have *A. distilla*, *fluvialis*, *pluvialis*, *fontana*, and *marina*, or distilled, river, rain, spring, and sea water.

**AQUA FORTIS**, literally, *strong water*, was the term used by the alchemists to denote nitric acid, and is still the commercial name of that acid.

**AQUA MARINE**, a name sometimes popularly given to the beryl (q.v.). Some green and blue varieties of topaz have also been styled A.

**AQUA REGINE**, literally, *queen's water*, is a mixture of concentrated sulphuric acid (oil of vitriol) and nitric acid, or of sulphuric acid and nitre. Either mixture evolves much fumes, and may be used as a disinfectant, as similar mixtures are sold under the name of *everlasting disinfectants*.

**AQUA REGIS**, or **REGIA**, literally, *royal water*, is the common name applied to a mixture of 1 part of nitric acid, and 2, 3, or 4 parts of hydrochloric acid. The general proportion is 1 to 2. The term *aqua regia* (royal water) was given to the mixture from the power it possesses of dissolving gold, which is the *king of the metals*.

**AQUARIANS**, a Christian sect in the 3d c. who used water instead of wine at the Lord's supper. The name was given in Africa, also, to those who in times of persecution forbore to use the wine in the communion when the scent of their breath would be likely to betray them.

**AQUARIUM**, a tank or vessel containing either salt or fresh water, and in which either marine or fresh-water plants and animals are kept in a living state. The name was formerly sometimes given to a tank or cistern placed in a hot-house, and intended for the cultivation of aquatic plants. The A., as now in use—originally called *vicarium* or *aquavivarium*, and intended chiefly for animals, became extremely common about 20 years ago. From 1854 to 1860, there was a mania for these scientific toys: they became not only an aid to study, but a source of rational amusement, depending in principle upon the relations discovered by science between animal and vegetable life, and particularly upon the consumption by plants, under the action of light, of the carbonic acid gas given forth by animals, and the consequent restoration to the air or water in which they live of the oxygen necessary for the maintenance of animal life. The A. must therefore contain both plants and animals, and in something like a proper proportion. Zoophytes, annelides, mollusca, crustacea, and fishes may thus, with due care, be kept in health, and their habits observed. The water must be frequently *aerated*, which can be accomplished by taking up portions of it and pouring them in again from a small height. The fresh-water A. is frequently provided with a fountain, which produces a continual change of water; but even where this is the case, the presence both of plants and animals is advantageous to the health of both. When sea-water cannot easily be procured for the marine A., a substitute may be made by mixing with rather less than 4 quarts of spring water  $3\frac{1}{2}$  ounces of common table-salt,  $\frac{1}{4}$  ounce of Epsom salts, 200 grains troy of chloride of magnesium, and 40 grains troy of chloride of potassium. With care, the water may be kept good for a long time. No dead animal or decaying plant must be permitted to remain in it. Salt water, artificially prepared, is not fit for the reception of animals at once; but a few plants must first be placed in it, for which purpose some of the green algae, species of *ulva* and *conferva*, are most suitable. The presence of a number of molluscous animals, such as the common periwinkle, is necessary for the consumption of the continually growing vegetable matter, and of the multitudinous spores (seeds), particularly of *conferva*, which would otherwise soon fill the water, rendering it greenish or brownish, and untransparent, and which may be seen beginning to vegetate everywhere on the pebbles or on the glass of the tank. In a fresh-water A., molluscous animals of similar habits, such as species of *lymnæa* or *planorbis*, are equally indispensable. For large aquaria, tanks of plate-glass are commonly used; smaller ones are made of bottle-glass or of crystal.

Of course, the plants and animals with which the A. is stocked are various, according to taste and opportunities, or the desire to make particular kinds the subjects of careful and continued observation. Blennies, gobies, and gray mullets are perhaps the kinds of fish most commonly seen in marine aquaria; gold-fishes, sticklebacks, and minnows are frequent enough in fresh-water ones. These have the advantage of being more easily kept in good health than many other kinds, and a further recommendation is found in their small size, and in the fine colors of the gold-fish. The nests of sticklebacks are a subject of unfailing interest. Crabs of various species, and actinæ or sea-anemones, are very generally among the larger inmates of the A. Serpulæ contribute much both to its interest and beauty, as they spread out their delicate and finely tinted branchiæ from the mouth of their shelly tube, and withdraw within it, quick as thought, upon the slightest disturbance. Balani or acorn-shells are very beautiful objects when they are seen opening their summit-valves, and rapidly stretching out and retracting their little nets. Even periwinkles and limpets are interesting, particularly when they are watched by the aid of a magnifying-glass, as they feed upon the spores of the *conferva* which have just begun to vegetate on the glass of the A., moving slowly along, with continual opening and shutting of the mouth, like cows at pasture, when the structure and motions of their mouths may be observed, and the singular beauty and brilliancy of colors never fails to command admiration. The use of a good magnifying lens adds greatly to the interest of the A., and zoophytes of exquisite forms and colors may be watched in the

actual processes of life. The feeding of fishes, crabs, sea-anemones, etc., is a source of amusement, and it is interesting even to note how the inmates of the A. occasionally feed on their fellow-prisoners.

The idea of the A. seems to have originated from Mr. Ward's invention of the *cases* which bear his name (see *WARDIAN CASES*), and in which delicate ferns and other plants grow so well even in towns; but the late Sir John Graham Dalzell began to keep living marine animals in his house in Edinburgh so early as 1790, and continued to do so till the year 1850. Mr. Warrington appears to have been the first to make experiments on its practicability, and the name of Mr. Gosse is intimately associated with its early development and introduction to popularity as a scientific plaything. A Mr. Price also conducted some very successful experiments as to the balance of animal and vegetable life in aquaria. The largest aquaria in the world are those at Brighton and Hamburg, and there is also one of large dimensions at the Crystal palace, Sydenham, as well as others in various parts of England, and in Scotland.

**AQUARIUS**, *The water-bearer*, the 11th sign of the zodiac, through which the sun moves in part of the months of Jan. and Feb. It is also the name of a zodiacal constellation, whose position in the heavens may be found by producing a line in a southerly direction through the stars in the head of Andromeda and the wing of Pegasus.

**AQUATIC** plants and animals are those that live either wholly or partly in water. The term is very vaguely used, those plants being often called A. which grow in ponds, ditches, etc., although not only their inflorescence, but great part of their foliage, is above the surface of the water, as well as those which more completely belong to that element; and a similar latitude of meaning prevails with regard to animals. Few phanerogamous (or flowering) plants exist entirely under water, although there are a few, like the common *zostera marina*, or grass-wrack, which do so, and produce even their flowers in that condition; others, of which the greater part of the plant is usually under water; produce their flowers upon, or considerably above, its surface, as those of the genera *salicornia*, *anacharis* (q.v.), etc. The leaves, as well as the flowers, of many float upon the water, of which the water-lilies furnish well-known and beautiful examples; whilst in *ranunculus aquatilis*, that exquisite ornament of our river margins, we have an instance of a kind not unfrequent, of great diversity between the lower leaves which remain submersed, and the upper leaves which float. Of cryptogamous plants, one great order, algae, is exclusively A., and these seem adapted to perform under water all the functions of their life. A. plants are, in general, of less compact structure than is usual in other plants, and are thus lighter and better adapted for rising in their growth towards the surface of the water; in order to which also some of the algae, as may be seen in more than one of the most common sea-weeds of our coasts, are provided with air-bladders of considerable magnitude. All this is the more necessary, as plants completely A. have generally little firmness of stem, and if their weight made them fall to the bottom, would lie in a mass, as they do when withdrawn from the water, in which, however, they gracefully float, their flexibility of stem enabling them to adapt themselves to waves or currents, which would destroy them if they were more rigid. So admirably are all things in nature harmonized.

Many animals, to a considerable extent A. in their habits, must not only breathe air, but are adapted for spending great part of their existence on dry land. Such are chiefly those that seek their food in the water. The peculiarities of structure by which they are fitted for wading, for swimming, for diving, and for remaining under water a longer time than other animals can, are very interesting and admirable. Even the fur of the beaver, the otter, the water-rat, and other animals of this description, is not liable to be drenched like that of other quadrupeds; and the plumage of water-fowls exhibits a similar peculiarity. The feet of many are webbed, so as to enable them to swim with great facility; and to this the general form, as in water-fowls, likewise exhibits a beautiful adaptation. The webbed feet in some, of which the habits are most thoroughly A., as seals, assume the character of a sort of paddle, admirably fitted for use in the water, but by means of which they can only move very awkwardly on land. The forms of whales and fishes are remarkably adapted for progression in water; whilst, instead of the limbs by which other vertebrate animals are enabled to move upon the land or to fly in the air, their great organ of locomotion is the tail, or rather the hinder part of the elongated body itself, with the tail as the blade of the great oar, which all the principal muscles of the body concur to move. Remarkable provision is made in A. animals of the higher vertebrate classes for the maintenance of the requisite animal heat, by the character of the fur or plumage; a purpose which the blubber of whales also most perfectly serves. In the colder-blooded animals, where no such provision is requisite, the structure of the heart is accommodated to the diminished necessity for oxygenation of the blood; and although reptiles in their perfect state must breathe air, many of them can remain long under water without inconvenience. Fishes, and the many other animals provided with branchiæ or gills, breathe in the water itself, deriving the necessary oxygen, which in their case is comparatively little, from the small particles of air with which it is mingled. They cannot subsist in water which has been deprived of air by boiling. Some A. insects carry down with them into the water particles of air entangled in hairs with which their bodies are abundantly furnished.

**AQUATIN'TA**, a mode of etching on copper, by which imitations of drawings in Indian ink, bistre, and sepia are produced. On a plate of copper a ground is prepared of black resin, on which the design is traced; a complicated series of manipulations with varnish and dilute acid is then gone through, until the desired result is attained. The process of A. has fallen into comparative disuse.

**AQUA TOFANA**, a poisonous liquid which was much talked of in the s. of Italy about the end of the 17th century. Its invention is still a matter of dubiety, but it is ascribed to a Sicilian woman named Tofana, who lived first at Palermo, but was obliged, from the attention of the authorities having been attracted to her proceedings, to take refuge in Naples. She sold the preparation in small phials, inscribed "Manna of St. Nicholas of Bari," there being a current superstition that from the tomb of that saint there flowed an oil of miraculous efficacy in many diseases. The poison was especially sought after by young wives that wished to get rid of their husbands. The number of husbands dying suddenly in Rome about the year 1659, raised suspicion, and a society of young married women was discovered, presided over by an old woman named Spara, who had learned the art of poisoning from Tofana. Spara and four other members of the society were publicly executed. Tofana continued to live to a great age in a cloister, in which she had taken refuge, but was at last (1709) dragged from it, and put to the torture, when she confessed having been instrumental to 600 deaths. According to one account she was strangled; but others affirm that she was still living in prison in 1730.

The A. T. is usually described as a clear, colorless, tasteless, and inodorous fluid; 5 or 6 drops were sufficient to produce death, which resulted slowly and without pain, inflammation, or fever; under a constant thirst, a weariness of life, and an aversion to food, the strength of the person gradually wasted away. It is even stated that the poison could be made to produce its effects in a determined time, long or short, according to the wish of the administrator—a notion generally prevalent in those ages respecting secret poisoning. The most wonderful stories are told of the mode of preparing this poison; for example, the spittle of a person driven nearly mad by continued tickling was held to be an essential ingredient. Later investigations into the real nature of the A. T. lead to the belief that it was principally a solution of arsenic.

**AQUA VITÆ** (Lat., water of life) is a common term applied to ardent spirits. During the alchemical epoch, brandy or distilled spirits was much used as a medicine, was considered a cure for all disorders, and even got the credit of prolonging life; and as Latin was the tongue employed in the conveyance of knowledge in those days, this restorer of health and prolonger of life was naturally christened A. V.

**AQUEDUCT** (Lat. *aquæ ductus*), an artificial course or channel by which water is conveyed along an inclined plain. When an A. is carried across a valley, it is usually raised on arches, and where elevated ground or hills intervene, a passage is cut, or, if necessary, a tunnel bored for it. Aqueducts were not unknown to the Greeks; but there are no remains of those which they constructed, and the brief notices of them by Pausanias, Herodotus, and others, do not enable us to form any distinct notion of their character. The aqueducts of the Romans were amongst the most magnificent of their works, and the noble supply of water which modern Rome derives from the three now in use, of which two are ancient, gives the stranger a very vivid conception of the vast scale on which the ancient city must have been provided with one of the most important appliances of civilization and refinement, when nine were employed to pour water into its baths and fountains.

The following are the names of the Roman aqueducts, chronologically arranged:

1. The *Aqua Appia*, begun by and named after the censor Appius Claudius about 313 B.C. It ran a course of between 6 and 7 m., its source being in the neighborhood of Palestrina. With the exception of a small portion near the Porta Capena, it was subterranean. No remains of it exist.
2. *Anio Vetus*, constructed about 273 B.C. by M. Curius Dentatus. It also was chiefly underground. Remains may be traced both at Tivoli and near the Porta Maggiore. From the point at which it quitted the river Anio, about 20 m. above Tivoli, to Rome, is about 43 miles.
3. *Aqua Marcia*, named after the prætor Quintus Marcius Rex, 145 B.C., had its source between Tivoli and Subiaco, and was consequently about 60 m. long. The noble arches which stretch across the Campagna for some 6 m. on the road to Frascati, are the portion of this A. which was above ground.
4. *Aqua Tepula* (126 B.C.) had its source near Tusculum, and its channel was carried over the arches of the last-mentioned A.
5. *Aqua Julia*, constructed by Agrippa, and named after Augustus 34 B.C. Like the Tepulan, it was carried along the Marcian arches, and its source was also near Tusculum. Remains of the three last-mentioned aqueducts still exist.
6. *Aqua Virgo*, also constructed by Agrippa, and said to have been named in consequence of the spring which supplied it having been pointed out by a girl to some of Agrippa's soldiers when in search of water. The Aqua Vergine, as it is now called, is still entire, having been restored by the popes Nicholas V. and Pius IV. 1568. The source of the Aqua Virgo is near the Anio, in the neighborhood of Torre Salona, on the Via Collatina, and about 14 m. from Rome. The original object of this A. was to sup-

ply the baths of Agrippa; its water now flows in the Fontana Trevi, that of the Piazza Navona, the Piazza Farnese, and the Barcaccia of the Piazza di Spagna. The water of the Aqua Virgo is the best in Rome.

7. *Aqua Alsietina*, constructed by Augustus, and afterwards restored by Trajan, and latterly by the popes. This A., now called the Aqua Paola, is situated on the right bank of the Tiber, and supplies the fountains in front of St. Peter's and the Fontana Paola on the Montorio. Its original object was to supply the Naumachia of Augustus, which was a sheet of water for the representation of sea-fights.

8. *Aqua Claudia*, commenced by Caligula and completed by Claudius, 51 A.D. A line of magnificent arches which formerly belonged to this A. still stretches across the Campagna, and forms one of the grandest of Roman ruins. It was used as a quarry by Sextus V. for the construction of the Aqua Felici, which now supplies the fountain of Termini, and various others in different parts of the city.

9. *Anio Novus*, which was the most copious of all the Roman fountains, though inferior to the Marcia in the solidity of its structure; it was also the longest of the aqueducts, pursuing a course of no less than 62 miles. By the two last-mentioned aqueducts, the former supply of water was doubled. In addition to the aqueducts already mentioned, there was the Aqua Trajana, which may, however, be regarded as a branch of the Anio Novus, and several others of later construction, such as the Antoniana, Alexandrina, and Jovia, none of which were to be compared with the older ones in extent and magnificence.

Nor was it for the uses of the capital alone that aqueducts were constructed. The A. of Trajan, at Civita Vecchia, which conveys the water a distance of 23 m., and that in the vicinity of Marzana, near Verona, with others that might be mentioned, still attest the existence of aqueducts in the smaller towns of Italy in Roman times. Even during the unpromising period which succeeded, the habit of their construction was not abandoned, that of Spoleto having been built by the Lombard duke Theodolapius in 604. The extraordinary A. by which the fountain at Siena is supplied, is said to have occupied two centuries in building; and the modern A. of Leghorn, which is not unworthy of the Roman models after which it was designed, is surpassed in magnificence by that of Pisa, with its thousand arches. In the more distant provinces which fell under the Roman power, aqueducts were likewise constructed—at Nicomedia, Ephesus, Smyrna, Alexandria, Syracuse, and in many of the towns in Gaul and in Spain. At Merida there are the remains of two aqueducts, of one of which there are 37 piers still standing with three tiers of arches. But the most magnificent structure of this class in Spain, is the A. of Segovia, in Old Castile, for which Spanish writers claim an antiquity beyond that of the Roman dominion; but which, there is reason to believe, belongs to the time of Trajan. At Evora, in Portugal, there is likewise an A. in good preservation, with a *castellum* or reservoir at its termination in the city, consisting of two stories, the lower one being decorated with pillars. But of all the provincial aqueducts, that at Nîmes, in Provence, is at once the most remarkable and the best preserved. The following description of it, which we transcribe from Mr. Murray's excellent hand-book for France, will convey to the reader a very vivid conception not only of this A. in particular, but of the very interesting class of works to which it belongs. "It consists of three rows of arches, raised one above the other, each smaller than the one below it; the lowest of 6 arches, the center tier of 11, and the uppermost of 35; the whole in a simple if not a stern style of architecture, destitute of ornament. It is by its magnitude, and the skillful fitting of its enormous blocks, that it makes an impression on the mind. It is the more striking from the utter solitude in which it stands—a rocky valley, partly covered with brushwood and greensward, with scarce a human habitation in sight, only a few goats browsing. After the lapse of 16 c., this colossal monument still spans the valley, joining hill to hill, in a nearly perfect state, only the upper part, at the northern extremity, being broken away. The highest range of arches carries a small canal, about 4½ ft. high and 4 ft. wide, just large enough for a man to creep through, still retaining a thick lining of Roman cement. It is covered with stone slabs, along which it is possible to walk from one end to the other, and to overlook the valley of the Gardon. The height of the Pont du Gard is 188 ft., and the length of the highest arcade 873 feet. Its use was to convey to the town of Nîmes the water of two springs, 25 m. distant. . . . The conveyance of this small stream was the sole object and use of this gigantic structure, an end which would now be attained by a few iron water-pipes." Neither the date nor the builder of the Pont du Gard is known with certainty, but it is ascribed to Agrippa, the nephew of Augustus; a conjecture which is rendered probable by the fact of his having restored the Appian, Marican, and Anienian, and constructed the Julian A. at Rome. The importance which the Romans attached to their aqueducts may be gathered from the fact, that special officers, invested with considerable authority, and, like all the higher officials, attended by lictors and public slaves, were appointed for their superintendence. Under the orders of these "guardians of the waters," we are told that, in the time of Nerva and Trajan, about 700 architects and others were employed in attending to the A. These officials were divided into various classes, and known by different names, according as their duties related to the care of the course of the A. the castella or reservoirs at its termini, the pavement of the channel, the cement with which it was covered, and the like.

The construction of aqueducts in recent times is comparatively rare, water being now generally conveyed in pipes; but two instances are worthy of notice—the *Lisbon A.*, and the *Croton A.* at New York. The former, completed in 1738, is about 3 leagues in length; near the city, it is carried over a deep valley for a length of 2400 ft. by a number of bold arches, the largest of which has a height of 250 ft., and a span of 115. The *Croton A.*, which conveys the waters of the Croton river for a distance of 38 m. to the city of New York, is one of the greatest undertakings of modern times. It was commenced in 1837, and finished in 1842, and is calculated to discharge upwards of 60,000,000 gallons in 24 hours. As the magnificence of aqueducts depends upon the height and number of arches requisite to carry them across valleys, it may give some idea of that under consideration when it is stated that Harlem river is crossed by 15 arches, 7 of which are of 50 ft. span, and 8 of 80 ft., the greatest height being 150 ft. from the foundation to the top of the mason-work.

**AQUEDUCT** (*ante*). In the United States, New York, Boston, Brooklyn, Chicago, and very many other cities and villages have As. for supplying water. The most expensive and costly is the *Croton A.* for supplying New York, completed in 1842 at a cost of about \$12,500,000. This A. is a little over 40 m. long, running through 16 tunnels, which have a total length of a mile and a quarter, over some short viaducts, and over the Harlem river on a stone bridge, 1460 ft. long and 116 ft. above high water, with 8 arches of 80 ft. and 7 of 50 ft. span. From the dam in the Croton river to the Harlem river, the A. is of stone, brick, and cement, arched over and under, in shape something like an egg, slightly depressed at either end. The height is 8½ ft., and the width an inch less than 7½ ft. It is capable of delivering 115,000,000 gallons per day. The *Boston A.* is 14½ m. long, and is chiefly a brick structure. Washington is supplied by an A., 18 m. long, of brick and rubble stone in cement, circular in shape, 9 ft. in diameter, subterranean for the most of its course. Besides these, much greater works are contemplated, such as bringing the water of the upper Hudson, 160 m. distant, or possibly of lake George, more than 200 m., to New York city.

**AQUEOUS HUMOR** is the fluid which occupies the space in the eye between the back of the cornea and the front of the lens, which, in foetal life, is divided into an *anterior* and *posterior* chamber by the *membra pupillaris* (q.v.), and in adult life by the iris. It consists of water, with, according to Berzelius, about a fiftieth of its weight made up of chloride of sodium and extractive matters held in solution.

Anatomists are not agreed as to the spring of this watery secretion, and are inclined to doubt the existence of a special secreting membrane, which used to be taken for granted. However, a layer of delicate epithelial cells, which exists at the back of the cornea (q.v.), is probably concerned in its formation. It is rapidly resecreted if allowed to escape by any wound in the cornea, and in some cases is formed in such quantity as to cause dropsy of the eye (*hydrophthalmia*).

**AQUEOUS ROCKS.** In geology, every layer which forms a portion of the solid crust of the earth is called a rock, it matters not whether its particles are incoherent, like soil or sand, or compacted together, like limestone and sandstone—to all alike, irrespective of popular usage, the geologist applies the term *rock*. In this wide sense, the rocks of the earth's crust are either igneous (q.v.) or sedimentary. These sedimentary rocks have an aqueous origin, with the exception of a very limited number, like drift-sand, which are brought into their present position by the action of the wind. Unlike the igneous rocks, whose particles have assumed their present form in the position they occupy, the materials of the A. R. have evidently been brought from a distance. They owe their origin to some older rock, whose decomposition or destruction has afforded the materials. The parent rock can often be identified. Its distance is indicated by the condition of the materials, whether they are rounded and water-worn, or angular and shingly.

The agents now at work, and which have been active in past geological ages, rubbing down and transporting the materials from which these rocks are formed, are the following: 1. *The sea*, destroying the rocks and cliffs, and beaches which form its boundary, and carrying off the eroded materials to form new rocks below the level of the sea. 2. *Rivers*, including the action of their smallest tributary rills, and even of the drops of rain, for these abrade and carry off the almost imperceptible particles from the surface where they fall; and when united they form the rill with its suspended sediment, and these again unite to form the river, which in its course not only retains what it has got, but scoops up more from its own bed, and carries all to the sea or lake, to deposit it there as a new stratum. It is difficult to estimate the influence of this agency. Sir Charles Lyell calculates that the Nile annually deposits in the Mediterranean 3,702,758,400 cubic feet of solid matter. 3. *Glaciers and icebergs*. These enormous moving masses of ice are not only loaded with rock-fragments, which are deposited as the ice melts, but are ever abrading the rocks over which they pass, and thus supply materials to form new layers. 4. Several stratified rocks have an evidently *organic origin*, such as chalk, and some limestones chiefly composed of animal remains, and coal consisting of vegetable carbon; but even these have been influenced in their formation by water so much as to justify us in classifying them with A. R. 5. The same remark applies to rocks which

have been *precipitated from a fluid* with which the materials existed in chemical combination, as has been the case with beds of salt, gypsum, and calcareous tufa.

As the result of these various actions, we have a series of rocks which, from their composition, may be classed as arenaceous, argillaceous, calcareous, carbonaceous, saline, and silicious. We must refer to these terms for the descriptions of the various rocks included under them.

The arrangement of the A. R. depending on their different ages, is of more importance in modern geology than that depending on their internal constitution. When a section of the earth's crust is examined, it is found to be composed of a series of layers which have been produced in succession. Comparing this with sections in other districts, it is noticed that there is a regularity in the several parts; for beds of the same structure are found in different localities, and these occupy the same relative position to the adjacent beds. A number of observations have shown that the crust of the earth is composed of a *regular series* of earthy deposits formed one after another, during successive periods of time. This general induction forms the basis of the following classification. For the description of the included strata we must again refer to the names of the different divisions:

I. TERTIARY OR KAINOZOIC EPOCH—1. Superficial deposits of recent period; 2. pleistocene period; 3. Pliocene or upper tertiary period; 4. Miocene or middle tertiary period; 5. Eocene or lower tertiary period.

II. SECONDARY OR MESOZOIC EPOCH—6. Cretaceous period; 7. Oolitic period; 8. Triassic period.

III. PRIMARY OR PALÆOZOIC EPOCH—9. Permian period; 10. Carboniferous period; 11. Devonian or old red sandstone period; 12. Silurian period; 13. Cambrian period.

**AQUIFOLIA'CEÆ**, a natural order of dicotyledonous or exogenous plants, of which the common holly (q.v.) is the best known example, and the only species that is a native of Europe. The order, however, contains more than one hundred species, the greater part of which are natives of America, and many of them belong to the tropical and sub-tropical parts of it. The species are all evergreen trees or shrubs, with simple, leathery leaves, and without stipules. The flowers are small and axillary, with 4 to 6 sepals, and a 4 to 6-parted corolla, into which the stamens are inserted, alternating with its segments. The ovary is fleshy and superior, with two or more cells, a solitary anatropal pendulous ovule in each cell, the cells generally becoming bony as distinct *stones* in the fruit, which is fleshy. The order is allied to *rhumnaceæ*, *celastraceæ*, and *ebenaceæ*. The most interesting species belong to the genus *ilex*, or holly (q.v.).

**AQUILA**. See EAGLE.

**AQUILA**, the capital of the Italian province of the same name, situated on the Pescara, near the loftiest of the Apennines, with a pop. of 14,000, ranks as a fortified t. of the fourth class, though its citadel is its only strong point. A. was built by the emperor Frederic II. from the ruins of the ancient *Amiternum*, a t. of the Sabines, and the birth-place of Sallust the historian. In 1703, it was almost destroyed by an earthquake, in which 2000 persons perished. A. is a bishop's see, has civil and criminal courts, and a lyceum, and is considered one of the best built towns in the kingdom. In 1841, much political disturbance took place here, and several of the inhabitants were imprisoned and executed in consequence. Altogether, public feeling in this t. and province is far more liberal than in most other parts of the kingdom.

**AQUILA**, CASPAR (the Latin name of Kaspar Adler), 1488-1560; a German theologian. He studied law in Augsburg, Germany, and in Italy, and was appointed pastor of Jenga. He embraced Luther's doctrines, for which he was kept in prison during the winter of 1519-20, but he was set free through the influence of Isabella, queen of Denmark. At Wittenberg he met Luther, whom he assisted in the translation of the Old Testament, having been appointed professor of Hebrew at W. In 1538, he became bishop of Saalfeld, but his vehement opposition to the interim of Charles V. in 1548, compelled him to fly for asylum to the countess of Schwarzburg. In 1550, he was given the deanery of Schmalkalden, and two years later was restored as bishop of Saalfeld, filling the office until his death. He left a number of controversial works and many sermons.

**AQUILA**, PONTICUS, a celebrated translator of the Old Testament into Greek, b. at Sinope. He flourished about the year 130 A.D., is said to have been a relation of the emperor Hadrian, and to have been first a pagan, then a Christian, and finally a Jew; submitting in his last conversion to the peculiar religious ceremony of circumcision. His translation of the Old Testament—which appears to have been undertaken for the benefit of his Hellenized countrymen—was so *literal*, that the Jews preferred it to the Septuagint, as did also the Judaizing sect of Christians, called Ebionites. Only a portion of the work remains, which has been edited by Montfaucon and others.

**AQUILARIA'CEÆ**, a natural order of dicotyledonous or exogenous plants, containing only about ten known species, all of which are trees with smooth branches and tough bark, natives of the tropical parts of Asia. The leaves are entire; the perianth leathery, turbinate, or tubular, its limb divided into four or five segments; the stamens usually ten; the filaments inserted into the orifice of the perianth; the ovary two-celled, with

two ovules; the stigma large; the fruit a 2-valved capsule, or a drupe. The order is chiefly interesting as producing the fragrant wood called aloes wood (q.v.).

**AQUILEGIA.** See COLUMBINE.

**AQUILE'JA**, or **AGLAR** (earlier, *Velia* or *Aquila*), is a small t. in Austria, at the head of the Adriatic, 22 m. w.n.w. of Trieste. Pop. about 2000. It is now sunk in utter insignificance, possessing no trade or public buildings of any note, except its cathedral; but in the time of the Roman emperors, it was one of the most important places n. of the metropolis. Its commerce was flourishing, for though 8 m. distant from the sea, vessels could reach it by canals connecting it with the rivers in its vicinity. It was both the central point of the transit-trade between the north and south of Europe, and the key of Italy against the barbarians. Founded by a Roman colony in 181 B.C., it became a favorite residence of Augustus; and in 168 A.D. was so strongly fortified by Marcus Aurelius, as to be considered the first bulwark of the empire on the n. It was called *Roma secunda*, the second Rome. Here the emperor Maximin perished; and in the vicinity Constantius lost his life in a battle against his brother Constans. When the t. was destroyed by Attila (452), it had 100,000 inhabitants. It never recovered, although it received some ecclesiastical honors, but has continued slowly dwindling down into deeper obscurity and wretchedness. There are numerous remains of its former splendor. Councils were held at A. in 381, 558, 698, and 1184 A.D.

**AQUINAS**, **THOMAS**, or **THOMAS OF AQUINO**, one of the most influential of the scholastic theologians, was of the family of the counts of Aquino, in the kingdom of Naples, and was b. in the castle of Rocca Secca in 1224. He received the rudiments of his education from the Benedictine monks at Monte-Casino, and completed his studies at the university of Naples. A strong inclination to philosophical speculation determined the young nobleman, against the will of his family, to enter (1243) the order of Dominicans. In order to frustrate the attempts of his friends to remove him from the convent, he was sent away from Naples, with the view of going to France; but his brothers took him by force from his conductors, and carried him to the paternal castle. Here he was guarded as a prisoner for two years, when, by the help of the Dominicans, he contrived to escape, and went through France to the Dominican convent at Cologne, in order to enjoy the instructions of the famous Albertus Magnus (q.v.). According to another account, he owed his release from confinement to the interference of the emperor and the pope. At Cologne he pursued his studies in such silence, that his companions gave him the name of the "dumb ox." But Albert, his master, is reported to have predicted, "that this ox would one day fill the world with his bellowing." Thoroughly imbued with the scholastic, dialectic, and Aristotelian philosophy, he came forward, after a few years, as a public teacher in Paris. His masterly application of this philosophy to the systematizing of theology, soon procured him a distinguished reputation. It was not, however, till 1257 that A. obtained the degree of doctor, as the university of the Sorbonne was hostile to the mendicant monks. He vindicated his order in his work, *Contra Impugnantes Dei Cultum et Religionem*; and, in a disputation in presence of the pope, procured the condemnation of the books of his adversaries. He continued the lecture with great applause in Paris, till Urban IV., in 1261, called him to Italy to teach philosophy in Rome, Bologna, and Pisa. Finally he came to reside in the convent at Naples, where he declined the offer of the dignity of archbishop, in order to devote himself entirely to study and lecturing. Being summoned by Gregory X. to attend the general council at Lyon, he was surprised by death on the way, 1274, at Fossanuova, in Naples. According to a report, he was poisoned at the instigation of Charles I. of Sicily, who dreaded the evidence that A. would give of him at Lyon.

Even during his life A. enjoyed the highest consideration in the church. His voice carried decisive weight with it; and his scholars called him the "universal," the "angelic doctor," and the "second Augustine." A general chapter of Dominicans in Paris made it obligatory on the members of the order, under pain of punishment, to defend his doctrines. It was chiefly the narratives of miracles said to have been wrought by A. that induced John XXII., in 1323, to give him a place among the saints. His remains were deposited in the convent of his order at Toulouse. Like most of the other scholastic theologians, he had no knowledge of Greek or Hebrew, and was almost equally ignorant of history; but his writings display a great expenditure of diligence and dialectic art, set off with the irresistible eloquence of zeal. His chief works are—a *Commentary on the Four Books of Sentences of Peter Lombard*, the *Summa Theologiae*, *Quaestiones Disputatae et Quodlibetales*, and *Opuscula Theologica*. He gave a new and scientific foundation to the doctrine of the church's treasury of works of supererogation, to that of withholding the cup from the laity in the communion, and to transubstantiation. He also treated Christian morals according to an arrangement of his own, and with a comprehensiveness that procured him the title of the "father of moral philosophy." The definiteness, clearness, and completeness of his method of handling the theology of the church, gave his works a superiority over the text-books of the earlier writers on systematic theology. His *Summa Theologiae* is the first attempt at a complete theological system. Accordingly, Pius V., to whom we owe the publication of the completest collection of A.'s works (18 vols., Rome, 1570; a newer but less trustworthy ed., 23 vols.,

Paris, 1636-41), ranks him with the greatest teachers of the church. In his philosophical writings, the ablest of which is his *Summa Fidei Catholice contra Gentiles*, he throws new light over the most abstract truths. The circumstances of A. being a Dominican, and boasted of by his order as their great ornament, excited the jealousy of the Franciscans against him. In the beginning of the 14th c., Duns Scotus (q.v.), a Franciscan, came forward as the declared opponent of the doctrines of A., and founded the philosophico-theological school of the Scotists, to whom the Thomists, mostly Dominicans, stood opposed. The Thomists leaned in philosophy to nominalism (q.v.), although they held the abstract form to be the essence of things; they followed the doctrines of Augustine as to grace, and disputed the immaculate conception of the Virgin. The Scotists, again, inclined to realism (q.v.), and to the views of the Semipelagians, and upheld the immaculate conception.

**AQUITA NIA**, the Latin name of a part of Gaul, originally including the country between the Pyrenees and the Garonne, peopled by Iberian tribes. Augustus, when he divided Gaul into four provinces, added to A. the country lying between the rivers Garonne and Loire. Afterwards, A. passed into the hands—first, of the West Goths, and then of the Franks; and during the Merovingian dynasty, became an independent duchy. Though subjugated by Charlemagne, the duchy again claimed independence under the weak monarchs of the Carolingian dynasty. In 1137, it was united to the crown of France by the marriage of Louis VII. with Eleanor, heiress of A. In 1152, A. became an English possession through the marriage of Henry II. with Eleanor, whom Louis had divorced, and a long series of disputes took place between England and France respecting A., which was at length ultimately united to the crown of France by Charles VII. in 1451.

**ARABESQUE** (Fr.), means merely *after the Arabian manner*; and, so far as etymology is concerned, might therefore be general in its application. In practice, however, it is used to characterize a peculiar kind of fantastic decoration commonly employed in conjunction with architecture, and which the Spanish Moors are supposed to have introduced into modern Europe. But the species of enrichment to which this term is now applied, was extensively employed both by the Greeks and Romans, the latter in particular being masters of the style. The Egyptians, from whom the Moors probably derived their original notions of this and other forms of art, also employed it in enriching their monumental decorations. But the A. of the Moors differed from that of the Egyptians in entirely excluding the figures of animals, the representation of which was forbidden by the Mohammedan religion, and confining itself entirely to the foliage, flowers, fruit, and tendrils of plants and trees, curiously and elaborately intertwined. This limitation of the field of A. was again departed from when the decorations were discovered on the walls of the baths of Titus, in the time of Leo X.; and more recently those in the houses at Herculaneum and Pompeii came to form the models of imitation, and the modern A. consists usually of combinations of plants, birds, and animals of all kinds, including the human figure, and embracing not only every natural variety, but stepping without hesitation beyond the bounds of nature. The freedom with which it admits the fantastic is, indeed, the leading peculiarity of A.; and as it is found in some form amongst every people who have attempted to give a visible representation of their fancies, it is spoken of by F. Schlegel as "the oldest and original form of fancy." The arabesques with which Raphael adorned the galleries of the Vatican, and which he is said to have imitated from those which he had been instrumental in discovering in the baths of Titus, are at once the most famous and the most beautiful which the modern world has produced. Arabesques are usually painted, though the term is also applied to sculptural representations of similar subjects in low relief.

**ARABGIR'**, or **ARABKIR** (anc. *Anabrace*), a t. of Asiatic Turkey, in the vilayet of Sivas, in a mountainous and rocky district, not far from the Euphrates, and 150 m. s.s.w. from Trebizond. It contains a pop. of about 30,000, nearly one fourth being Armenians, the other three fourths Turks. It is to the enterprise and industry of the Armenians that the t. owes its prosperity. It is specially noted for the manufacture of goods from English cotton yarn. The neighboring country is inhabited by Turcomans.

**ARA'BIA**—called by the inhabitants, Jezirat-al-Arab (the peninsula of A.); by the Turks and Persians, Arabistân—is the great south-western peninsula of Asia, and is situated 12° 40' to 34° n. lat., and 32° 30' to 60° e. long. Its length from n. to s. is about 1500 m.; its breadth, about 800; its area, 1,230,000 sq. m.; and its pop. is roughly estimated at 4,000,000. It is bounded on the n. by Asiatic Turkey; on the e., by the Persian gulf and the gulf of Oman; on the s., by the gulf of Oman and the Indian ocean; and on the w., by the Red sea. It is connected with Africa on the n.w. by the isthmus of Suez. Through the center of the land, between Mecca and Medina, runs the tropic of Cancer. The name A. has been derived by some from *Araba* (which means a level waste), a district in the province of Tehama; by others, from *Eber*, a word signifying a nomad ("wanderer"), as the primitive Arabs were such. This would connect it with the word Hebrew, which has a similar origin. Others, again, are inclined to derive it from the Hebrew verb *Arab*, to go down—that is, the region in which the sun appeared to set to the Semitic dwellers on the Euphrates. There is also a Hebrew word, *Arâbah*, which means "a barren place," and which is occasionally employed in Scripture to denote the

border-land between Syria and Arabia. Ptolemy is supposed to be the author of the famous threefold division into *Arabia Petraea*, *Arabia Felix*, and *Arabia Deserta*—the first of which included the whole of the n. w. portion; the second, the w. and s. w. coasts; and the third, the whole of the dimly known interior. This division, however, is not recognized by the natives themselves, neither is it very accurate as at present understood, for *Petraea* was not intended to mean rocky or stony. Ptolemy formed the adjective from the flourishing city of Petra (the capital of the kingdom of the Nabathæans), whose proper name was Thamud—that is, the rock with a single stream. The word *Felix*, also, arose from an incorrect translation of Yemen, which does not signify “happy,” but the land lying to the right of Mecca—as *Al-Shan* (Syria) means the land lying to the left of the same. The divisions of the Arab geographers are as follows—1. *Baker-el-Tour Sinai* (Desert of Mount Sinai); 2. The *Hedjaz* (Land of Pilgrimage); 3. *Tehama* and *Yemen*, along the Red sea; 4. *Hadramaut*, the region along the southern coast; 5. *Oman*, the kingdom of Muscat; 6. *Bahrein*, on the Persian gulf; 7. *Nedjed*, the central highlands of Arabia.

Our knowledge of the interior of A. is still very imperfect in detail, but its general characteristics are decidedly African. The largest portion of it lies in that great desert zone which stretches from the shores of the Atlantic to those of the northern Pacific. The interior, so far as it has yet been explored by Europeans, seem to be a great plateau, in some places reaching a height of 8000 feet. The western border crest of this plateau may be regarded as part of a mountain-chain, beginning in the n. with Lebanon, and stretching s. to the straits of Bab-el-Mandeb. From Bab-el-Mandeb another chain runs n. e., parallel to the coast, to Oman. From the mountain-range on the w. the plateau slopes to the n. e., and forms, in general, a vast tract of shifting sands, interspersed here and there about the center with various ranges of hills, which, like the shores of the peninsula, are generally barren and uninteresting.

A. has, on the whole, an African climate. Though surrounded on three sides by the sea, its chains of hills exclude in a great measure the modifying influence of currents of air from the ocean. In several parts of A. hardly a refreshing shower falls in the course of the year, and vegetation is almost unknown; in other sultry districts, the date-palm is almost the only proof of vegetable life. Over large sterile tracts hangs a sky of almost eternal serenity. The short rainy season which occurs on the w. coast, during our summer months, fills periodically the *wadis* (hollow places) with water, while slight frosts mark the winters in the center and north-east. During the hot season, the simoom (q. v.) blows, but only in the northern part of the land. The terraced districts are more favorable to culture, and produce wheat, barley, millet, palms, tobacco, indigo, cotton, sugar, tamarinds, excellent coffee, and many aromatic and spice-plants, as balsam, aloe, myrrh, frankincense, etc. A. is destitute of forests, but has vast stretches of desert grass fragrant with aromatic herbs, and furnishing admirable pasturage for the splendid breed of horses. Coffee, one of the most important exports, is an indigenous product both of A. and Africa.

In the animal kingdom, an African character prevails generally. Sheep, goats, and oxen satisfy the immediate domestic and personal necessities of the inhabitants, to whom the camel and horse are trusty companions in their far wanderings. Gazelles and ostriches frequent the oases of the deserts, where the lion, panther, hyena, and jackal hunt their prey. Monkeys, pheasants, and doves are found in the fertile districts, where flights of locusts often make sad devastation. Fish and turtle abound on the coast. The noble breed of Arabian horses has been cultivated for several thousand years; but the most characteristic of all animals in the peninsula is the camel, which has been both poetically and justly styled “the ship of the desert.” It may be regarded as an Arabian animal, for it seems to be proved that it is not a native of Africa, but has migrated from the peninsula with its master. The camel is not found among the figures of animals in the ancient Egyptian paintings on walls, nor does it appear to have been known to the Carthaginians. The breed of Oman is celebrated for its beauty and swiftness. Among the minerals of A. may be mentioned iron, copper, lead, coal, basalt, and asphaltum, and the precious stones emerald, carnelian, agate, and onyx. Pearls are found in the Persian gulf.

But the most interesting features of the peninsula are found in its ancient and peculiar population. The Arab is of medium stature, muscular make, and brown complexion. Earnestness and lofty pride look out of his glowing eyes; by nature he is quick, sharp-witted, lively, and passionately fond of poetry. Courage, temperance, hospitality, and good faith are his leading virtues; but these are often marred by a spirit of sanguinary revenge and rapacity. His wife keeps the house and educates the children. The Arab cannot conceive a higher felicity than the birth of a camel or a foal, or that his verses should be honored with the applause of his tribe.

Arabian life is either *nomadic* or *settled*. The wandering tribes, or Bedouins, are well known to entertain very loose notions of the rights of property. The located tribes, styled Hadesi and Fellahs, are despised by the Bedouin, who scorns to be tied down to the soil, even where such bondage might make him wealthy. As Ritter in his *Com. parative Geography* observes—Arabia “is the anti-industrial central point in the world,” for on every side, branching out to the e. or w., we find industry making progress, while here centuries pass away without any improvement save what has been introduced, almost compulsorily, by foreigners. The trade carried on by exports of coffee, dates,

figs, spices, and drugs, though still considerable, is said to be only a shadow of the old commerce which existed before the circumnavigation of Africa, or when Aden was in its prime and the Red sea was the great commercial route. A. has few manufactures, but carries on a transit-trade in foreign fabrics, besides importing these to some extent for its own necessities. Few nations have approached so near as the Arabs to the condition of standing still in a moral and social point of view. Considering how little progress has been made, it is remarkable that a greater degeneracy has not taken place. Even in the desert the children are taught to read, write, and calculate; and in the towns, education to a certain degree is general. The division of the people into so many tribes is a barrier to everything like a great national improvement; indeed, the word national can hardly be properly applied to the Arabs. It would require a series of extraordinary events to develop afresh that terrible unity which Mohammed gave A. for a time. The government is patriarchal, and the chief men of the various tribes have the title of emir, sheik, or imaum. Their function appears limited to leading the troops in the time of war, to levying tribute, and to the administration of justice. A spirit of liberty in the people moderates the authority of their chieftains; but instances of extreme despotism have not been unfrequent both in early and modern times.

To number all the distinct states of A. would be impossible in the present state of our knowledge; but the seven great divisions are those which we have enumerated. Of these the most important at present is Nedjed, a state which, while under Wahabite fanaticism it rose rapidly into leading power, and seemed for a time to wane, yet since 1849 has asserted its pre-eminence in central Arabia, and brought even Oman under its influence. See WAHABIS. Yemen possesses two very important commercial towns, Mocha and Loheia, situated on the coast of the Red sea; Oman has made considerable advances in civilization. It forms to some extent an exception to the general lack of manufacturing activity exhibited by the Arabians, having manufactures of silk and cotton turbans, sashes, canvas, arms, gunpowder, etc. The imaum of Muscat formerly claimed authority over the whole of Oman, the islands in the Persian gulf, a portion of the Persian coast, and a vast extent of territory on the e. coast of Africa, including some valuable islands. See MUSCAT and ZANZIBAR. Rostak is another large t. inland from Muscat. The district or division of Hedjaz contains the holy cities of Mecca and Medina, with their seaports, Jiddah (q.v.) and Yembo.

The history of Arabia, before the time of Mohammed, is involved in mystery, and has little interest, on account of its want of connection with the world's general progress. The aborigines of A. were probably Cushites, most of whom, on account of the hostile immigration of certain Semitic races, descended from Joktan, grandson of Shem, passed over into Abyssinia. A few, however, remained, who inhabited the western coasts. Subsequently, another Semitic race, descended from Abraham, settled in the land. The oldest Arabian tribes are now extinct, and only a traditional memory even of their names exists; but the Semitic chiefs, Joktan or Kalitan, and Ishmael, are generally considered to be the fathers of the present inhabitants. The descendants of the former are the pure Arabs; those of the latter are held to be only Arabicized. The princes of A. belong wholly to the first. A great-grandson of Joktan, Himzar or Homeir, inaugurated a dynasty—the Himyarides or Homeritæ—which ruled in Yemen for upwards of 2000 years. This was a prosperous time. The Arabs of Yemen, and partly those of the desert, dwelt in towns and cultivated the soil; carried on commerce with the East Indies, Persia, Syria, and Abyssinia, in the last of which countries they planted numerous colonies. The rest of the people, however, lived nomadically, as now. Bravely, for thousands of years, they maintained their freedom, their faith, and their peculiar customs against the assaults of the great military empires. Neither the Babylonian and Assyrian nor the Egyptian and Persian kings could reduce the Arabs to a state of subjugation. Alexander had determined to try his power against A., when death interrupted his plans. Three centuries after Alexander's death, the Romans had extended their empire to the borders of A., and Trajan, in 107 A.D., penetrated far into the interior; but though the northern chieftains were brought into a formal subjection to the empire, A. was not made a Roman province. The old Himyarides in Yemen stoutly maintained their independence, and an expedition against them in the time of Augustus completely failed. With the decay of the Roman empire, strife and lawlessness increased. The Arab races continued in a scattered, disorganized condition, and many hundreds of years passed away in intestine wars, during which the central highland region was the scene of those feuds of the Arab clans so copiously sung by the native poets. Christianity found an early entrance into A. The Jews, in considerable numbers, migrated into A. after the destruction of Jerusalem, and made many proselytes, especially in Yemen. This diversity of creeds in the peninsula was favorable to the introduction of the doctrine of Mohammed, which forms the grand epoch in Arabian history, and brings it into close connection with the general history of civilization. Now, for the first time, the people of A. became united, and powerful enough to erect new empires in the three quarters of the world. The dominion of the Arabs, from the time of Mohammed to the fall of the caliphate of Bagdad in 1258, or even to the expulsion of the Moors from Spain in 1492, is an important period in the history of civilization. See the articles MOORS, CALIPHS. But the movements which had such great effects on the destinies of other nations, produced but little change in the interior of A.; and, after

the brilliant career of conquest was ended, the peninsula was left in an exhausted condition. Then followed the subjugation of Yemen by the Turks in the sixteenth century; their expulsion in the seventeenth century; the dominion of the Portuguese over Muscat, 1508-1659; the conquests of Oman and the temporary victories gained by the Persians at the close of the 16th c.; and, lastly, the appearance of the Wahabis (q.v.), 1770, whose moral influence is still felt. The latter took an important part in the political affairs of A., but their progress was interrupted by Mehemet Ali, the pasha of Egypt, who subjugated the coast-country of Hedjaz, with some parts of the coast of Yemen, and in 1818 gained a decisive advantage through the victory of Ibrahim Pasha. The subsequent events of the year 1840, in Syria, compelled Mehemet, however, to concentrate his forces, and to resign all claims upon the territories lying beyond the Red sea. See WAHABIS.

**ARABIAN ARCHITECTURE.** So inseparable is the connection between architecture and religion, that it may be stated as a general rule that no sooner is a new religion engendered than it finds expression in new architectural forms. Of this we have an interesting instance in the simultaneous rise of Mohammedanism, and of the style of architecture commonly called Arabian or Moorish, but to which the name of Mohammedan might far more appropriately be given, seeing that it has everywhere followed the religion of the crescent, and that the Arabians previously had no architecture peculiar to themselves. It is further remarkable that the style of which we speak seems to have arisen, as it were, undesignedly, or, at all events, without any conscious effort on the part of the people amongst whom it first appeared. The followers of the prophet contemplated nothing peculiar in their ecclesiastical structures; and at first their mosques were built by Christian architects from Constantinople. As a natural consequence, they resembled Byzantine churches, modified in the countries of which the Moors successively possessed themselves by the features of the existing churches. Gradually the new and fanciful ornamentation known as arabesque (q.v.) was added to the recognized features of Greek and Roman edifices. The exclusion of animal figures, which their abhorrence of the very appearance of idolatry necessitated, confined the Mohammedan artists to the imitation of vegetable productions, varied by geometrical patterns and inscriptions, of which the letters were woven into forms which suited them for architectural uses. But the most original feature in their edifices, and that by which they have continued to be marked from all others, is the horse shoe arch. The pointed arch, on the other hand, and the various forms of the trefoil and quatrefoil arches, though there can be little doubt that we are indebted for them to the rich invention of the Moorish architects, have become so entirely Christian as to be no longer associated in our minds with the religion of the prophet. It is said that the pointed arch is to be found in Mohammedan buildings so early as 780 A.D. (Parker's *Glossary of Architecture*), whereas the earliest examples of its use in Christian architecture belong to the 12th c. Moorish architecture probably reached its highest point of development in the Alhambra, with the characteristics of which the English public have been made familiar by means of the court which bears its name in the palace at Sydenham.

**ARABIAN GULF.** See RED SEA.

**ARABIAN LANGUAGE AND LITERATURE.** Regarding the oldest literary culture of the Arabians, we possess but slight information. That their poetry at least must have had a very early development, may be inferred from the natural disposition of the inhabitants, who were characterized for their high spirit, courage, love of adventure, and delight in the glory of war. As far back as Solomon's time, the queen of Sheba (probably *Arabia Felix*) was noted for her sententious sayings. The nomadic tribes, living under the patriarchal rule of their sheiks, possessed everything that was favorable to the growth of a simple and natural poetry. They had quick and vivid feelings, and a rich, glowing fancy, which, operating upon the perils, the hardships, and strange confederate life they led in those barren sand-deserts, and amongst naked rocks, could hardly fail to call forth a wild and vigorous minstrelsy. Before the time of Mohammed, the Arabians had celebrated poets who sang the feuds of tribes, and the praises of heroes and fair women. During the great fairs at Mecca and Okadh, poetic contests were held before the people as at the Grecian games; and the poems to which the prize was awarded were rewritten in golden characters, and suspended in the Kaaba at Mecca, the venerable national temple which the Mohammedans affirm to have been built by Abraham, or Ishmael. They are termed the *Moallakât*—i.e., "the suspended"—from the honor conferred on them, and are remarkable for their pathos, soaring conceptions, richness of imagery and phraseology, free and unconstrained spirit, and the glow of their love and hate. Among the famous poets of this early period are Nabegha, Asha, Shanfara—whose works were translated and published by De Sacy in his *Chrestomathie Arabe*—and, lastly, Kaab-ben-Zohair, who lived to celebrate the praises of the prophet Mohammed.

But the most brilliant period of Arabic culture is that which Mohammed himself inaugurated in the Koran. His new doctrines of faith and life, collected under this title by the first calif, Abubekr, were revised and published by Othman, the third calif. The naturally adventurous spirit of the Arabs found a suitable excitement in the half-religious, half military system of Mohammed, and, after his death, their fanaticism prepared them

for their subsequent career. Like an overwhelming torrent, they passed over the neighboring states, and in the short space of 80 years from the death of their prophet, had extended their dominion from Egypt to India, and from Lisbon to Samarcand. During this time nothing can be said of their culture and refinement. A fanatical desire of conquest prevailed. Gradually, however, by their intercourse with civilized nations, the Arabian conquerors were themselves subjected to the humanizing influence of letters, and, after 749 A.D., or during the reign of the Abassides, literature, arts, and sciences appeared, and were generously fostered under the splendid sway, first of Almanson (754-775), and afterwards of the celebrated Harun-al-Raschid (786-808). Learned men were now invited from many countries, and remunerated for their labors with princely munificence; the works of the best Greek, Syriac, and old Persian writers were translated into Arabic, and spread abroad in numerous copies. The calif Al-Mamun, who reigned from 813 to 833, offered to the Greek emperor five tons of gold and a perpetual treaty of peace, on condition that the philosopher Leo should be allowed for a time to give instruction to the former. There are few instances of such a price offered for lessons in philosophy. Under the sway of the same Al-Mamun, excellent schools were founded in Bagdad, Basra, Bokhara, and Kufa; while large libraries were collected at Alexandria, Bagdad, and Cairo. In Spain, the high school of Cordova rivaled the literary fame of Bagdad, and, generally, in the 10th c., the Arabs appeared everywhere as the preservers and distributors of knowledge. Pupils from France, and other European countries, then began to repair to Spain in great numbers, to study mathematics and medicine under the Arabs. There were 14 academies, with many preparatory and upper schools in Spain, and 5 very considerable public libraries; that of the calif Hakem containing, as is said, more than 600,000 volumes. This state of culture, when compared with that prevalent before Mohammed, shows a rapidity of progress in knowledge almost as remarkable as the career of Arabian conquest.

In geography, history, philosophy, medicine, physics, and mathematics, the Arabians rendered important services to science; and the Arabic words still employed in science—such as algebra, alcohol, azimuth, zenith, nadir, with many names of stars, etc.—remain as indications of their influence on the early intellectual culture of Europe. But geography owes most to them during the middle ages. In Africa and Asia, the boundaries of geographical science were extended, and the old Arab treatises on geography and works of travels in several countries by Abulfeda, Edrisi, Leo Africanus, Ibn Batuta, Ibn Foslan, Ibn Jobair, Albiruni the astronomer, and others, are still interesting and valuable.

History was also studiously cultivated. The oldest Arabic historian of whom we know is Mohammed-al-Kelbi (d. in 819). About the same period, however, flourished several other historians. After the dawn of the 10th c., history became a favorite study of the Arabs. The first who attempted a universal survey of the subject were Masudi, Tabari, Hamza of Ispahan, and Eutychius, the Christian patriarch of Alexandria. Masudi's work is entitled *Meadows of Gold and Mines of Gems*. These were followed by Abulfaraj and George Elmakin (both Christians), Abulfeda, and others. Nuvairi wrote a *History of Sicily under the Government of the Arabs*. Various sections of Arabic histories relating to the crusades have been translated into French. On the dominion of the Arabs in Spain, several works were written by Abul-Kasem of Cordova (d. in 1139), Temini, and others. For extended notices we may refer the student of Arabic literature to the translations by Quatremere and others; but especially to the *Encyclopädischen Uebersicht der Wissenschaften des Orients*, by Von Hammer (2 vols. Leip. 1804).

Arabian theology and jurisprudence are intimately connected, and both founded on the Koran; but are by no means so simple and uniform as is generally supposed. Speculation first began to prevail during the Ommaiade dynasty, and the Aristotelian philosophy to be studied by the Arabs. As a consequence, the vague statements of the Koran were soon variously interpreted, and a host of sects gradually arose. Of these 4 only are regarded as orthodox, leaving not less than 72 heretical, whose discordant tenets are stated in the work of Sharistani (edited by Cureton, London, 1842). The four orthodox sects are: the Hanefites, who do not reject tradition, but subordinate it to rationalism; the Shafites, who entirely refuse the aids of reason and philosophy in their treatment of theology; the Kambalites and the Malechites, who allow speculation on points where there is no tradition. The collection of traditions known as the *Sunna* gives an account of the sayings and doings of Mohammed, and, though pedantic in its details, is in substance more valuable than the Koran. The interpretation of the Koran constitutes the principal part of education in theological jurisprudence. The most celebrated of the commentators are Samakhshari and Baidhawi. The conquest of Algiers has rendered the study of Arabic or Mohammedan law indispensable to the French. The result is, that several most important works on that subject have appeared of late from the Paris press, such as *Précis de Jurisprudence Musulmane, selon le Rite Malécite par Khalil-Ibn-Isahak* (translated by Perron, Paris, 1848), and *Législation Musulmane Sunnite, Rite Hanéfi* (Paris, 1848).

Arabian philosophy, which was of Grecian origin, held the same relation to the Koran as the scholasticism of the middle ages did to the Christian Scriptures—that is, it was regarded as the servant of faith. The chief study of the Arabs was the writings of Aristotle, who became known in Spain, and subsequently in all western Europe,

through translations from Arabic into Latin; though the Arabs themselves only knew the Greek philosopher in translations made during the time of the Abbassides. Especial attention was paid to logic and metaphysics. The most distinguished of their philosophical writers are: Alkendi of Basra, who flourished about the beginning of the 9th c.; Alfarabi, who wrote a work on First Principles in 954; Avicenna (d. 1036), who combined the study of logic and metaphysics with that of medicine, and made considerable progress in chemistry, nosology, and medical botany; Ibn-Yahya, who acquired a high reputation as an original thinker; Alghazali (d. 1111), who wrote a book entitled *The Destruction of all Idolatrous Philosophical Systems*; Abubekr-ibn-Tofail (d. 1190), who taught in his philosophical novel *Hai-ebn-Yokdan* (edited by Pococke, Oxford, 1671) the development of men from animals; and his pupil, Averrhoes, greatly esteemed as an expositor of Aristotle. For an account of these men and their systems, see *Sur les Ecoles Philosophiques chez les Arabes*, etc., by Schmölders (Paris, 1842), and Ritter's *Ueber unsere Kenntniss der Arab. Philosophie* (Gött. 1844); also Renan's *Averroès et l'Averroïsme* (1850).

Many of these illustrious Arabian philosophers were also physicians. The great skill which the Arabs acquired in their knowledge of the uses and properties of medicinal herbs is traced by Humboldt to their geographical position. The southern part of Arabia "is characterized by the highly developed vital force pervading vegetation, by which an abundance of aromatic and balsamic juices is yielded to man from various beneficial and deleterious substances. The attention of the people must early have been directed to the natural products of their native soil, and those brought as articles of commerce from the accessible coasts of Malabar, Ceylon, and eastern Africa. Hence arose the wish to distinguish carefully from one another these precious articles of commerce, which were so important to medicine, manufacture, etc. . . . The science of medicine, when considered with reference to its scientific development, is essentially a creation of the Arabs, to whom the oldest, and, at the same time, one of the richest sources of knowledge—that of the Indian physicians—had been early opened. Chemical pharmacy (see ALCHEMY) was created by the Arabs, whilst to them are also due the first official prescriptions regarding the preparation and admixture of different remedial agents—the dispensing recipes of the present day. These were subsequently diffused over the south of Europe by the school of Salerno" (Humboldt's *Cosmos*, vol. ii. p. 581, Bohn's translation). Pharmacy and *materia medica* naturally led to botany and chemistry. For three centuries, from the 8th to the 11th—a rich scientific culture prevailed. Schools of philosophy and medicine sprung up at Jondisahur, Bagdad, Ispahan, Firuzabad, Bokhara, Kufa, Basra, Alexandria, Cordova, etc. In all departments of medical science a great advance was made, except in anatomy. The reason of this exception lies in the fact that the Koran forbids the dissection of bodies. The most famous writers on medicine are Aharun, Alkendi, Avicenna (q. v.), who wrote the *Canon of Medicine*, for a long time the only handbook on the subject; Ali-ben-Abbas, Ishak-ben-Soleiman, Abulkasem, Averrhoes (q. v.), who wrote a complete system of medicine; Ali-ben-Isa, etc.

In mathematics, the Arabs made great advances by the introduction of the numerals and mode of notation now in use, of the sine instead of the chord (in trigonometry), and of a more extended application of algebra. Astronomy was zealously studied in the famous schools and observatories of Bagdad and Cordova. Alzahan wrote upon optics; Nassireddin translated the Elements of Euclid; Jeber-ben-Afla furnished a commentary on the trigonometry of Ptolemy, etc. The *Almagest* or System of Astronomy by Ptolemy, was translated into Arabic by Alhazi and Sergius as early as 812. In the 10th c., Albaten observed the advance of the line of the apsides in the earth's orbit; Mohammed-ben-Jeber-al-Batani, the obliquity of the ecliptic; Alpetragius wrote a theory of the planets; and Abul-Hassan-Ali on astronomical instruments.

Besides these advances in the solid branches of knowledge, the genius of the Arabs continually flowered into poetry. Numerous poets sprang up in all lands where the children of the desert had carried their irresistible faith. Their verse, however, was not like the rude, simple minstrelsy of a purely patriarchal people; it gradually allied itself to the prevailing culture, and took, especially in the golden epoch of Arabian civilization, a highly artistic form. Motenebbi, Abul-Ala, and others acquired a great reputation for their delicate idylls; Busiri, for his eulogy of Mohammed; Hamadani, as the first to introduce novels in verse (of which he wrote 400 under the title of *Makâmât*), a style of literature which was brought to perfection by Hariri; Azzeddin, for his ingenious allegorical poem, "The Birds and the Flowers." Besides these, a singularly wild and fantastic prose literature made its appearance, in which the craving for the wonderful and gorgeous, so characteristic of the restless, adventure-loving Arabs, was richly gratified. Romances and legendary tales abounded. The most famous of these are: *The Arabian Nights' Entertainments* (q. v.), *The Exploits of Antar*, *The Exploits of the Champions*, and *The Exploits of the Hero*. In fact, with the exception of the drama, there was no sort of poetry which the Arabs did not attempt. The effect of this universality and richness in Arabic literature was, that it exercised a powerful influence on modern European poetry. The tales of fays, charms, sorceries, and the whole gorgeous machinery of enchantment passed into the poetry of the west. During the middle ages of European history, several of the most popular and wide-spread books were of Arabic origin; such as, *The Seven Wise Masters*, and *The Fables of Bidpai*, though the Arabians themselves borrowed largely from the Persian stories and the Greek fables.

All this culture of the early ages of Mohammedanism presents a strong contrast to the ignorance which now prevails among the Arabs. The brutal fanaticism of the Turks nipped the blooming promise of the east; sunk in stupid indolence, the peoples await in apathetic resignation their deliverance and return to higher modes of life. Literature furnishes now nothing worthy of notice. Learning spends itself principally in commentaries and scholia, in scholastic discussions on the subject-matter of dogmatics and jurisprudence, and in tedious grammatical disquisitions concerning the old Arabic speech, generally acute and subtle, but always unprofitable and unenlivening. The swift and mobile genius of the east has departed, and pedantic dullness has usurped its place. There are "Dryasdusts" even in the desert. A few modern writers have attempted, with more or less success, to imitate European forms of thought and sentiment. Of these may be mentioned Michael Sabbagh of Syria (*La Colombe Messagère*, Arabic and French, Paris, 1805); the Sheik, Refaa of Cairo (*The Broken Lyre*, Paris, 1827; *Manners and Customs of the Europeans*, Cairo, 1834; *Travels in France*, Cairo, 1835); and Nasif-Effendi, of Beirut, who wrote the critical observations in De Sacy's edition of Hariri (*Epistola Critica*, Leipsic, 1848).

The Arabic also possesses a Christian and Jewish literature which, however, is chiefly ecclesiastical. Its principal ornaments are Eutychius, Elmakin, and Abulfaraj. Translations of the Old Testament were made not from the Hebrew, but from the Septuagint, or from Latin versions. In the middle ages, the Spanish Jews employed Arabic for their learned compositions; and several of the most important works of Moses Maimonides, etc., were originally written in that tongue.

The Arabic language, it has been remarked, is at once both *rich* and *poor*. It is necessarily destitute of innumerable words describing those ideas and objects which only civilization can develop or produce; but, on the other hand, the rich and nimble fancy of the Arabians has multiplied, to an almost incredible extent, the synonyms of their desert-tongue, so that in some cases several hundreds of expressions are found for the same thing. The Arabic belongs to the so-called Semitic family of languages, among which it is distinguished for its antiquity and soft flexible grace. It is divided into two dialects—a northern and southern. The former, through the instrumentality of the Koran, became the predominant language of literature and commerce throughout the whole extent of the A. dominions; the latter, called the Himyarite, although in all probability the source of the Ethiopic language and writing, is known as yet only by a few inscriptions, etc. The earliest Arabic grammarian is Abul-Aswad-al-Duli, who flourished under the fourth calif, Ali. The first who reduced the prosody and metre of the Arabian poets to a system, was Khalil-ben-Ahmed-al-Ferahidi of Basra. Al-Jauhari, who died in 1009 A.D., drew up a dictionary of the pure Arabic speech, which he entitled *Al-Sihah* ("Purity"), and which is held in high estimation to this day. Mohammed-ben-Yakub-al-Firuzabadi, who d. in 1414, was the author of an Arabic Thesaurus, entitled *Al-Kamus* ("The Ocean"), which is the best lexicon in the language, and has consequently been translated into Persian and Turkish. Jordshani has explained, in alphabetical order, the meaning of the technical terms used in Arabic art and science. His work was published by Flügel (Leip. 1845), under the title of *Definitiones*. Meidani made a large collection of Arabic "saws," apothegms, etc., which was published by Freytag, Bonn, 1838. Through the conquests of the Arabs in Sicily and Spain, their language became known in Europe; but notwithstanding the numerous traces of its influence in various European tongues, it became forgotten after the expulsion of the Moors from Spain. The first European scholars who earnestly took up the subject were the Dutch, in the 17th c.; after them, the Germans, French, and English. It is now, however, beginning to be considered a necessary part of a learned theological education. The modern Arabic of the inhabitants is substantially the same as that of the Koran, but the lapse of time has gradually introduced changes in the grammatical forms of the language, similar to those which have occurred in other languages. The purest Arabic is said to be spoken in Yemen, or *Arabia Felix*. With the exception of the Roman characters, the Arabic have been more widely diffused than those of any other tongue on the face of the earth. (See Möller's *Oriental Paleography*, Eisleben, 1844, etc.)

*Arabic Writing*.—Like all Semitic writing, this proceeds from right to left. It is borrowed from the old Syriac, and was probably introduced into Arabia by Christian missionaries about the time of Mohammed. In its oldest form it is called Kufic, from the town of Kufa, on the Euphrates, where the transcription of the Koran was busily carried on. Its characters are rude and coarse, and it has particular symbols for only 16 of the 28 Arabic consonants. This writing, nevertheless, continued to be employed for 300 years, and for coins and inscriptions even later; but in the 10th c. it was displaced for common purposes by a current handwriting, the *Neskhi*, introduced by Ebn Mokla. This is the character still in use. In it, the consonants which resemble each other are distinguished by points, and the vowels by strokes over and under the line.

**ARABIAN NIGHTS' ENTERTAINMENTS**, a collection of Oriental tales, first made known to Europe by Antony Galland, a French orientalist, under the title of *The Thousand and One Nights, Arabian Stories, Translated into French*. They were published at Paris, in 12 vols. 12mo, from 1704 till 1717, and were received by many as the production of the genius of the translator himself, rather than the collection of an unknown

*Arabian author*, as Galland had stated in his dedication. Oriental scholars did not hesitate at first to declare against their authenticity, and denounce them as forgeries. Having taken only an obscure place in the literature of the east, and their style unfitting them from being classed among models of eloquence or taste—having no object of a religious, moral, or philosophical kind in view, while the manners and customs delineated in them were different from all received ideas of those of the Moslem nations—their success took the critics by surprise. The work became highly esteemed by the public; it filled Europe with its fame; it had abundance of readers, and no lack of editors. Few books have been translated into so many different languages, and given delight to so large a number of readers. It may be said that, in these Oriental tales, there has sprung up a new branch of literature, for their influence on the literature of the present day is easily discernible. Here are found, depicted with much simplicity and great effect, the scenes of the town-life of the Moslem. The prowess of the Arab knight, his passion for adventure, his dexterity, his love and his revenge, the craft of his wives, the hypocrisy of his priests, and the corruptibility of his judges, are all dramatically delineated—far more vividly represented, in fact, than is possible in a book of travels; while gilded palaces, charming women, lovely gardens, and exquisite repasts captivate the senses of the reader, and transport him to the land of wonder and enjoyment. Besides entertaining the mind with the kaleidoscopic wonders of a teeming and luxurious fancy, which is their most obvious merit, they present a treasure of instruction upon life in general, and oriental life in particular. And this is undeniable, notwithstanding the fact, that the aspects of society they depict are far from standing high in the social scale, either as to civilization or morality. In them no story is to be found that will rank in morality with the story of Joseph and his brethren, simply because the Moslem faith will not admit of that, any more than the decline of Arab civilization at the time the tales must have been originally promulgated. Indeed, the first translator, having a conviction of a demoralizing tendency of this kind, avoided giving several objectionable parts of some of the stories. The thread of the narrative in these entertainments is generally simple and clear, often leading into the departments of fable, and occasionally into the regions of the supernatural and the domains of popular superstition. The tales, even when long, are not tiresome; for they consist of shorter stories branching off from the main one, or rather incased within it, the smaller within the larger, and perhaps a smaller within that, like the little boxes used by conjurors.

For many years all doubt as to the authenticity of the *Thousand and One Nights* has been dispelled. Several MS. copies have been found, and no less than four editions of the Arabic text have been published. A more thorough acquaintance with mediæval and modern Arab life has proven the genuineness of the stories, and the truthfulness of their general representation of the mind of the Moslem. In them there are evident signs of a declension from a refined and superior civilization; the marvelous and supernatural is predominant; despotism in all its forms is manifest; and a prevalent falsity and insincerity of character visible, not only in the narrative, but in the tone of common conversation, replete as it is with oaths and asseverations.

The origin of the work—where and by whom written—is still involved in mystery. According to some, the tales are susceptible of a threefold division. The most beautiful, and in fancy the richest, appear to have come from India, the cradle of story and fable; the tender and often sentimental love tales seem of Persian origin; while the masterly pictures of life, and the witty anecdotes, claim to be the product of Arabia. Throughout, however, everything is conformable to the character and customs of the town population of Arabia, and to the Mohammedan faith. The baron de Sacy, in 1829, thus stated his opinion on these points. Speaking of the work he says: "It appears to me that it was originally written in Syria, and in the vulgar dialect; that it was never completed by its author; that, subsequently, imitators endeavored to perfect the work, either by the insertion of novels already known, but which formed no part of the original collection, or by composing some themselves, with more or less talent, whence arise the great variations observable among the different MSS. of the collection; that the inserted tales were added at different periods, and perhaps in different countries, but chiefly in Egypt; and, lastly the only thing which can be affirmed, with much appearance of probability, in regard to the time when the work was composed, is—that it is not very old, as its language proves, but still that, when it was brought out, the use of tobacco and coffee was unknown, since no mention of either is made in the work."

Galland's French edition was speedily translated into all the languages of Europe; edition following edition with great rapidity, some of them with enlargements and others with modifications. Latterly, a Dr. Scott gave a superior English edition, "carefully revised, and occasionally corrected from the Arabic." At length a new English translation from the Arabic, with copious notes and highly artistic embellishments, appeared in 1839. It was the work of Edward William Lane, a gentleman whose long residence in Egypt enabled him to acquire so thorough a knowledge of the language, manners, and customs of the Egyptian Arabs, as has furnished not only a superior version, but a series of notes embodying a portraiture of Egypto-Arabian life at once faithful and vivid.

The popularity of this wonderful book has given rise to hundreds of imitations. Among the best of the French are—*Les Mille et Un Jours*, *Mille et Une Quart d'Heures*,

and the *Contes d'un Endormeur*; perhaps the best of the English imitations is the *Tales of the Genii*, by Sir Charles Morell; while the best of the German appears to be one got up from the Perso-Arabic, the *Furaj bád el Shidda* (Joy after Sorrow), a popular work, and repeatedly published.

**ARABIAN NUMERALS** or CIPHERS—the characters 0, 1, 2, 3, 4, 5, 6, 7, 8, 9. Properly, they should be styled Hindu or Indian numerals, for the Arabs borrowed them, along with the decimal system of notation, from the Hindus. According to one account, Gerbert (afterwards Sylvester II.) learned the use of them from the Moors in Spain in the 10th c.; others think it more probable that Leonardo of Pisa (see ALGEBRA) first introduced them from the east into Italy about 1202. Yet the use of them was long in making its way, and was not general before the invention of printing. Accounts continued to be kept in Roman numerals up to the 16th century. See NUMERALS and NUMERATION.

**ARABIAN SEA**, anciently *Mare Erythræum*, or the *Red Sea*, that bay of the Indian ocean which lies between India on the east and Arabia on the west. Its northern boundary is Beloochistan; while its natural and convenient limit on the south is a line drawn from cape Comorin in Hindustan to cape Guardafui in Africa, and thence continued along the coast to the strait of Bab-el-Mandeb. In e. long. it extends from 43° 32' at cape Bab-el-Mandeb, to 77° 30' at cape Comorin; and in n. lat. from 8° 5' at cape Comorin, to about 26° at the s.w. point of Beloochistan. Including its two great arms, the Red sea proper and the Persian gulf, it stretches far both north and west. By the former it is, since the opening of the Suez canal in 1869, connected with the Mediterranean sea. In this last aspect the A. S. long occupied a most prominent place in the commerce of the world—a place which, after having lost it for more than 300 years through the doubling of the cape of Good Hope in 1497, it has lately in a great measure regained, through the enterprise of English capitalists, the Egyptian government, and the perseverance of M. Lesseps.

In the history of navigation, also, the A. S. proper is specially entitled to notice. It was along its northern shores that Nearchus, the admiral of Alexander of Macedon, conducted the first well-authenticated voyage, on a large scale, of exploration and discovery; and across it the trade-winds, blowing alternately from n.e. and s.w., were wont to wait the Greeks of Egypt, without either chart or compass, about the commencement of the Christian era. See SUEZ CANAL.

**ARABICI**, or **ARABIANS**, a sect in Arabia in the 3d c. who held that the soul dies with the body and will be raised again with it. Eusebius says that Origen convinced them of their error, and they renounced it at the "Council of Arabia," A.D. 246.

**ARABINE** is the essential principle of gum-arabic (q.v.), and is obtained pure by adding alcohol to a solution of gum-arabic in water, when the A. is precipitated in white flocculi.

**ARACAN**, or **ARRACAN**, the most northern division of British Burmah, is bounded on the n. by Chittagong, on the e. by Ava, on the s. by Pegu, and on the w. by the bay of Bengal. It extends in n. lat. from 18° to 21° 33', and in e. long. from 92° 10' to 94° 50'. Its extreme length is 290 m.; and its breadth from 90 m. at the n., gradually diminishes towards the s., so as to yield an average of little more than 45. The area is 14,526 sq. miles. A range of mountains, nearly parallel with the line of coast, the highest point 7000 ft. above the sea-level, separates A. from Pegu and upper Burmah. The soil of the northern portion of A. is alluvial; but the country is hilly, difficult of access, and covered with forest. The province is divided into four districts—Akyab, Sandoway, Ramree, and North Aracan. The British conquest of the province has been highly beneficial in every way. In 1825–26, the population was only about 100,000; in 1881 it was 173,000, showing an increase of 73 per cent in 5 or 6 years; in 1889 it had increased to 248,000; before 1854 it was upwards of 321,000; and in the returns of 1872, it was stated to be 483,363, or 33 mouths to the sq. miles. With these results the face of the country and the state of trade fully correspond. Rice and salt constitute the chief articles of exportation; the others are tobacco, sugar, wood, oil, betel nuts, buffalo hides and horns, elephants' teeth, dried fish, and edible birds' nests. The imports consist of British woollens, muslins, cutlery, and glass.

There have been various indications of a volcanic nature in A. In the islands of Ramree and Cheduba there exist springs of muddy water which emit bubbles of gas. Two severe earthquakes have taken place respectively in 1763 and 1833, the latter having thrown up, in several places, muddy water of a sulphurous smell, and also, on one particular spot, vapor and flame to the height of several hundred feet. Of the mineral resources very little is known. Iron-ore has been found, but not in such quantity and quality as to come into profitable competition with British iron. Coal also exists, which is understood to be good, but, from whatever cause, it has not been extensively worked. There are no lakes in the province, nor are there any rivers of much importance, though the Aeng, which appears to be the most available among them, is said to be navigable during spring-tides to 45 m. from its mouth.

**ARACAN**, or **ARRACAN**, a city of British Burmah, and, till lately, the capital of the province of the same name. It is situated about 50 m. from the sea, in lat. 20° 42' n.,

and long. 93° 24' e. Lying in a swampy valley which, on almost every side, is confined by hills, A. is subject to febrile disease in all its forms. Previous to the first Burmese war—the occasion which brought it under British dominion—it is said to have contained 18,000 houses; while in 1835, after an interval of less than 10 years, its population is represented as having been only 8000 or 10,000—the decrease being, in a considerable degree, the consequence of its having ceased to be the seat of government. A. is now, in fact, interesting only from its old associations. The most striking memorial of antiquity is its dilapidated fort, consisting of three concentric walls such as only a powerful state could have constructed. Beyond the limits, too, of this citadel, the town, as a whole, appears to have been surrounded by a circumvallation of 9 m. in length, composed partly of steep and rugged eminences and partly of artificial works. These defenses, which are believed to be several centuries old, the British carried by assault on 1st April, 1825.

**ARACA'RI**, or **ARICARI**, *Pteroglossus*, a genus of birds closely allied to the toucans (see **TOUCAN**), and differing from them chiefly in the somewhat smaller bill, which is not so thick as the head. They are generally also of smaller size, and the prevailing color of their plumage is green, often varied with brilliant red and yellow. Like the toucans, they are natives of the warm parts of South America.

**ARACA'TI**, a t. and port in Brazil, on the river Jaguaribe, 10 m. from its mouth. It is well built, has five or six churches and a town hall. The exports are hides and cotton. Pop. about 5000.

**ARA'CEE**. See **ARUM**.

**ARACHIS**, a genus of plants of the natural order *leguminosæ*, sub-order *papilionaceæ*, natives of the warm parts of America, of which, until recently, the only known species was the *A. hypogæa*, sometimes called the underground kidney-bean, and more frequently the ground-nut. It also receives the names of earth-nut, American earth-nut, and mandubi. It is an annual plant, with hairy pinnate leaves, which have four leaflets. The flowers are yellow, the standard veined with red. After flowering, the flower-stalks elongate and bend towards the earth, into which the pods penetrate, ripening underground. The pods have a lining of a sort of network, and generally contain two, three, or four seeds, which are about the size of a hazel-nut, of a sweet taste, with a little of the flavor which belongs to most kinds of pulse. This plant is now cultivated in all the warm regions of the globe, and its usefulness is such that its cultivation is likely to extend. It was introduced from Peru into Spain, and thence into France. It succeeds in favorable situations even in the middle of France, where it is sown after all danger of frost is thought to be over, and yields from eighty to a hundred fold. Its cultivation is so general in the western parts of Africa, and even in the interior, that doubts have been therefore entertained of its American origin, of which, however, the most eminent botanists seem to be quite satisfied. The seeds are sometimes eaten raw, but more generally boiled or roasted. In New Spain, and in some parts of Africa, they form one of the principal articles of food; but the importance of the plant is chiefly owing to the fixed oil contained in them, which is used for the same purposes as olive or almond oil, and is quite equal to olive oil either for lamps or for the table. This oil is also much used in Spain in the manufacture of soap and of chocolate. A bushel of the seeds yields one gallon of oil, when expressed cold; if heat is applied, the quantity is greater, but the quality inferior. It has become a considerable article of commerce. The *A. hypogæa* delights in a light and sandy, but at the same time fertile, soil. The seeds are dug up as roots or tubers usually are. The root has qualities resembling those of licorice, for which it is sometimes used. The herbage is good food for cattle. Several new species of this genus have been discovered in Brazil.

**ARACH'NIDA**, or **ARACENIDES** (from the Gr. *arachne*, a spider), a class of articulated animals, commonly regarded as intermediate between insects and crustacea. They were included by Linnaeus amongst insects, and placed in the order *aptera*. Like the crustacea, they have the head and thorax united into one piece, but they differ from them and from insects in having simple eyes, and in the absence of proper antennæ, instead of which many of them are provided with a sort of antennal claws called *chelicerae*. These and other organs connected with a complex mouth, disappear, however, in some of the lower kinds, which have merely a sort of proboscis for suction. Some of them breathe by means of pulmonary cavities; others, by tracheæ, like insects; and upon this difference is founded the primary division of the class into two orders—*pulmonaria* and *trachearia*. Spiders and scorpions belong to the first of these orders, and mites, ticks, etc. (*acari*), to the second. Some of the A. inhabit water, but their mode of respiration is that of terrestrial animals; and they seem to carry air with them by means of the hair which covers their bodies. The sexes are distinct. They are oviparous. They have two or more eyes, very frequently eight; and the relative position of these affords marks for distinction of genera. They have generally eight legs, but some have only six. With the exception of the acari, they are solitary in their mode of life, and most of them prey upon insects, of which, however, in general, they only suck the blood. Some of the lower kinds are parasitic upon insects, and a few live on decaying animal and vegetable substances. See **ACARUS**, **MITE**, **SCORPION**, **SPIDER**, and **TICK**.

**ARACHNOID MEMBRANE**, one of the three coverings of the brain and spinal cord, is a thin, glistening, serous membrane, which, by its parietal layer, adheres inseparably to the dura-mater on its outer side, and more loosely to the pia-mater, which is between it and the brain substance. Between the pia-mater and the A. M. in some situations there are considerable intervals (sub-arachnoid spaces); they are filled with a fluid named cerebro-spinal, the presence of which is necessary to the proper action of the nervous centers. See CEREbro-SPINAL FLUID—PIA-MATER.

**ARAD**, a t. in the district of A. in upper Hungary. It is situated on the right bank of the Marosh, an affluent of the Theiss, and is also styled Old A., to distinguish it from New A., which is built on the opposite side of the river. A. has a pop. (1869) of 32,725, including many Jews, who are very wealthy. It carries on a large trade in corn, tobacco, etc., and was at one time the greatest cattle-market in Hungary, and is even yet only inferior to Pesth and Debreczin. During the 17th c., it was often captured, and at last destroyed by the Turks. Its new fortifications, erected in 1763, made A. an important position in the revolutionary war of 1849, when it was occupied for a considerable time by the Austrian general Berger, who capitulated here in July, 1849. From this place Kossuth issued his proclamation of Aug. 11, 1849, in which he expressed in impassioned terms his despair of the Hungarian cause for the present. After the catastrophe of Világos, on the 17th Aug., A. was surrendered to the Russians through the treachery of Görgey.

New A., a t. in the Banat of Temesvar, contains (1869) 4960 inhabitants, including many Germans, who are the principal persons in the place. The district or province of A. has an area of 1700 sq. m., and contains (1869) 304,713 inhabitants. The eastern district is occupied by a branch-chain of the Carpathian mountains, which contain marble quarries, and mines of copper and iron; the w. is level, and produces wheat, maize, and several varieties of wine, as well as abundance of fruits. The inhabitants are chiefly Wallachians.

**AR'ADUS** (now **RUAD**), a rocky island of about 600 acres, off the mouth of the river Eleutherus, 2 m. from shore and 35 or 40 m. n. from Tripoli. Strabo says that the city of A. was founded by fugitives from Sidon. It was independent, ruled over the adjacent coast, and assisted the Macedonians in the siege of Tyre. Later, the town became subject to Persia, to Antiochus Epiphanes, and to Rome. In 638, the caliph Omar's commander destroyed A., and it was not rebuilt. The ruins show that it was once a very strong place. At present A. has a pop. of 2000 to 3000, chiefly fishermen and their families. There are extensive remains of Phœnician walls; and the remarkable submarine springs, which supplied the early city with water, have been found.

**AREOMETER**. See AREOMETER.

**A'RAFAT**, MOUNT, or *Jebel-er-'rahme* (mountain of mercy), is a granite hill about 15 m. s.e. of Mecca, which is believed by the Mohammedans to be the spot where Adam, conducted by the angel Gabriel, met again his wife Eve, after a punitive separation of 200 years, on account of their disobedience in Paradise. It is not above 200 ft. high, but its circuit is a mile and a half. Its importance since the time of Mohammed arises from its being the scene of a yearly procession of the faithful who visit Mecca. Burckhardt, who witnessed the procession of 1814, states that not less than 70,000 people were present, and that at least forty different languages were spoken. The principal part of the religious ceremony of this pilgrimage is a sermon, the hearing of which entitles all to the name and privileges of a hadji.

**ARAGO**, DOMINIQUE, a celebrated French astronomer and natural philosopher, was b. Feb. 26, 1786, at Estagel, near Perpignan, in the department of the eastern Pyrenees. At the early age of 17, he entered the polytechnic school at Paris, where the spirit, promptitude, and vivid intelligence he exhibited in his answers to the questions of Legendre, excited the admiration of every one. In 1804, he became secretary to the observatory at Paris. Two years afterwards, he was engaged, with Biot and others, by the French government, to carry out the measurement of an arc of the meridian, which had been commenced by Delambre and Méchain. A. and Biot had to extend it from Barcelona to the Balearic isles. The two *savants* established themselves on the summit of Mt. Galatza, one of the highest of the Catalonian branch of the eastern Pyrenees. Here they lived for many months, communicating by signals with their Spanish collaborators, across the Mediterranean in the little isle of Ivica, though many a night the furious tempests destroyed their hut along with the labors of weeks. Visitors they had none, except two Carthusian monks, who were wont to come up and spend a portion of the evening in converse with them. Before A. had completed his calculations, Biot had returned to France, and war had broken out betwixt the two nations. A. was now held to be a spy; his signals were interrupted; and with great difficulty he succeeded in making his escape to Majorca, where he voluntarily imprisoned himself in the citadel of Belver, near Palma. At last he obtained his liberty on condition of proceeding to Algiers, which he did; but was captured, on his return to France, by a Spanish cruiser, and sent to the hulks at Palamos. He was, however, liberated after a time, and sailed once more for France; but almost as he was entering the port of Marseille, a tempest arose which drove the vessel across the Mediterranean all the way to Algiers. The former dey, to whose

demands he had owed his liberation from the hulks, was dead; his successor, a ferocious tyrant, placed him on his list of slaves, and intended to employ him as interpreter. After some time, he was released at the request of the French consul, and, narrowly escaping another capture by an English frigate, finally found his way to Marseille in July, 1809. As a reward for his suffering in the cause of science, the academy of sciences suspended its standing rules in his favor; and though only 23 years of age, he was elected member in the place of Lalande, who had just died, and was appointed professor of analytical mathematics in the polytechnic school. Afterwards, his attention was devoted more to astronomy, magnetism, galvanism, and the polarization of light. In 1811, he read a paper to the academy, which may be considered the foundation of "chromatic polarization." In 1812, he commenced his extraordinary course of lectures on astronomy, etc., which fascinated all Paris—the *savants*, by their scientific rigor and solidity; the many, by their brilliancy of style. In 1816, along with Guy Lussac, A. established the *Annales de Chimie et de Physique*, and confirmed the truth of the undulatory theory of light. In the same year he visited England for the first time, and made the acquaintance of various persons distinguished in science, especially Dr. Thomas Young. In 1818 appeared his *Recueil d'Observations géodésiques, astronomiques et physiques*. In 1820, he turned his facile and inventive genius into a new channel, and made several important discoveries in electro-magnetism. Oersted had shown that a magnetic needle was deflected by a voltaic current passing along a wire. A. pursued the investigation, and found that not only a magnetic needle, but even non-magnetic substances, such as rods of iron or steel, became subject to deflection also, exhibiting, during the action of the voltaic current, a positive magnetic power, which, however, ceased with the cessation of the current. Some time after, he demonstrated that a bar of copper, and other non-magnetic metals, when moved circularly, exert a noticeable influence on the magnetic needle. For this discovery of the development of magnetism by rotation, he obtained, in 1825, the Copley medal of the royal society of London; and in 1834, when he again visited Great Britain, especial honors were paid to him by the friends of science in Edinburgh and Glasgow. Four years previous to this second visit to Great Britain, he had received the honor he most coveted—that of being made perpetual secretary of the academy. It was while holding this office that he wrote his famous *éloges* of deceased members, the beauty of which has given him so high a place among French prose-writers. As a politician, also, his career was remarkable. He was a keen republican, and took a prominent part in the July revolution (1830). In the following year he was elected by Perpignan as member of the chamber of deputies, where he occupied a position on the extreme left. In the February revolution of 1848, he was chosen a member of the provisional government, and appointed minister of war and marine. In this position he resisted the proposed measures of the socialist party, regarding the constitution of the United States as the beau-ideal of democracy. His popularity in his own province was the means of preventing the discontented population of the east Pyrenees from proceeding to lawless and violent measures. On the question of the presidency, A. opposed Louis Napoleon, declared himself against the policy of the new ministry, and refused to take the oath of allegiance after the *coup d'état* of 1852. The emperor, in a letter, paid a high eulogium on his talents and virtues, and made a special exception in his case. A. died Oct. 3, 1853. In his general character A. was sociable, energetic, and fond of fame. He was the intimate friend of Alexander von Humboldt.

ARAGO, EMMANUEL, author and French politician; b. Paris, Aug. 6, 1812. In youth he produced a volume of poems and some plays, but at the age of 25 left literature for the bar, where he soon became eminent in political cases. He became an ardent republican, and defended such political recusants as Martin Bernard and Barbes. On the 24th of Feb., 1848, when the abdication of the king was announced in the chamber, A. rose, and, proclaiming that by that act royalty was extinct, demanded the deposition of the Orleans family, and protested against a regency. Under the provisional government, A. was sent to Lyons as commissary general, and prevented a serious insurrection by applying half a million francs to relieve immediate distress. He was afterwards a member of the general assembly for the department of Eastern Pyrenees, and was envoy to Prussia, where he interested himself for the oppressed Poles, procuring the liberation of gen. Microlawski. He resigned as soon as Napoleon was elected, and became one of the future emperor's most active opponents, vigorously protesting against the expedition to Rome. After the *coup d'état*, Dec. 2, 1851, he quitted political life, returning to his law practice. In 1870, he was a member of the provisional government, and soon afterwards succeeded Cremieux as minister of justice. In Feb., 1871, he was nominated for minister of the interior, and minister of war *ad interim* in place of Gambetta.

ARAGO, JACQUES ÉTIENNE VICTOR, brother of the great *savant*, was born in 1790. In 1817, he accompanied the expedition, under Freycinet, in a voyage round the world. Afterwards, we find him engaged, first at Bordeaux, and then at Toulouse, in several branches of light literature, industriously writing, in company with other scribes, a multitude of vaudevilles, besides publishing several poems and romances. In the year 1835, he undertook the management of the theater at Rouen; but having become afflicted with blindness, he was compelled to resign this post in 1837. To his early voyage round the world we owe two very pleasant books of travel: *Promenade autour du Monde* (Paris,

1838), *Souvenir d'un aveugle Voyage autour du Monde* (Paris, 1838). In 1849, though deprived of sight, he formed a company of speculators; placed himself at the head of it, and departed for California, to search for gold on a large scale. His companions mutinied and left him, deserted and disappointed, at Valparaiso. On his return, he published his painful experiences, under the title, *Voyage d'un aveugle en Californie et dans les Régions aurifères* (Paris, 1851). He d. Jan. 1, 1855.—A., ETIENNE, another brother of the astronomer, was b. 1802, and is well known in France as a popular *feuilletonist* in the *Siccle*, and other journals. He held an appointment under the provisional government, as director-general of the post-office, in which he displayed great vigor, promptitude, and sense, and achieved several postal reforms; was elected member of the national assembly; was compromised by the insurrection in June, and sentenced to exile for life. In 1859, he returned to France; and at the time of the Franco-Prussian war was mayor of Paris—an office which he resigned in Nov. 1870.—A. JEAN, another of the brothers A., b. 1789, d. 1836, was general of the republican army in Mexico, and wrote, in Spanish, a history of Mexico.

**ARAGON**, once a kingdom, then a province in the n.e. of Spain, lies between  $40^{\circ} 2'$  and  $42^{\circ} 54'$  n. lat., and long.  $2^{\circ} 10'$  w. and  $0^{\circ} 45'$  e. Greatest length from n. to s., 190 m.; breadth, 130. Area, 17,900 sq.m. Pop. '70, 928,718. It is bounded, n., by the Pyrenees, separating it from France; w., by Navarre, and Old and New Castile; s., by Valencia, and part of New Castile; and e., by Catalonia, and part of Valencia. The river Ebro, which descends from the northern heights of Old Castile, flows through the middle of A. in a south-easterly direction, receiving numerous tributaries both from the lofty regions of the Pyrenees and from the Sierras in the south; of the former, the principal are the Noguera, which forms the boundary-line between Aragon and Catalonia, the Essera, and the Gallega; of the latter, the principal are the Guadalope, the San Martin, and the Salon. The province is naturally divided into the level country, along the Ebro, and the northern mountainous district of upper Aragon. The central plain is sterile, poorly supplied with water, and intersected by deep ravines (*barancos*). Agriculture is here confined to the raising of maize, vines, and olives; but on the sides of the Ebro, where water abounds, rice and other grains are abundantly produced; and in the valleys of upper A., which are at once the most beautiful and fertile of all the Pyrenean valleys, we find a splendid vegetation, and a soil that enables the inhabitants, in spite of the wretchedness of their agriculture, to grow considerable quantities of wheat, rye, maize, barley, etc. The climate of the province is various; comparatively cool in the mountain-districts, but often very sultry on the plains. Spurs of the Pyrenees strike down into the province a long way. It is between these ridges that the rich valleys lie, some of them upwards of 20 m. long. The slopes of the hills are clothed with forests of oak, beech, and pine, and the felled timber is floated down the rivers into the Ebro, and thence down to Tortosa at its mouth. The minerals of the province are copper, lead, iron, salt, alum, saltpetre, coal, and amber. The manufactures are inconsiderable. A., peopled by a brave, active, enduring, but obstinate race, has frequently been the arena of sanguinary warfare. It early became a Roman province; and, on the fall of the empire, passed into the hands of the West Goths, but was conquered by the Moors in the beginning of the 8th century. The rulers of A., after it had been recovered from the Moors, and united with Catalonia (1137), became powerful; obtained possession of the Balearic isles in 1213, of Sicily in 1282, of Sardinia in 1326, and of Naples in 1440. By the marriage of Ferdinand with Isabella, heiress of Castile, in 1469, the two states of A. and Castile were united, and formed the foundation of the great Spanish monarchy. After Ferdinand's death in 1516, the union of the states was made permanent. In the war with the French, 1808-9, Saragossa, the capital of A., was remarkable for its heroic defense under Palafox; and in recent Spanish wars the people of A. have displayed the same courage which marked their conduct on that memorable occasion. Upper A. was on the side of the queen; but lower A. generally adhered to the party of Don Carlos. The province is now divided into three departments—Saragossa, Teruel, and Huesca. The chief towns are Saragossa, Calatayud, Huesca, and Teruel. See SARAGOSSA, etc.

**ARAGONA**, a t. of Sicily, 8 m. n.e. from Girgenti. It is a poor t., and stands in the midst of bare green downs; but the hills above it are clothed with pines, cypresses, olives, almonds, and carobs. The only object of interest is the old castle of the princes of A., a huge building, in the renaissance style, which has fallen much into decay. Pop. 7947.

**ARAGUA**, a province of Venezuela, in a fertile region on the river A. It is a small division, only about 3700 sq.m.; pop., estimated, 81,500. Chief t., Victoria.

**ARAGUAY**, a large river of Brazil, rising in s. lat.  $18^{\circ} 10'$ , and w. long.  $51^{\circ} 30'$ . Like most of the considerable rivers of the country, it flows towards the n. After a course of about 1000 m. to San Joao, it there joins the Tocantins, which again, after a northerly course of 300 m. more, mingles its estuary with that of the Amazon round the isle of Marajo. Like most of the rivers in this part of Brazil, the A. is of difficult navigation, being frequently interrupted by rapids.

**ARAGUAY'A**, or ARAGUITA. See ARAGUAY, *ante*.

ARAKTCHEIEF, ALEXEI ANDREEVITCH, Count, 1769-1834; a Russian general. Of low origin, he rose rapidly to high rank under the favoritism of Paul, who made him governor of St. Petersburg and commander of his personal guards. After Paul's assassination, A. was kept near the person of Alexander, the succeeding emperor, and in the late years of that emperor's reign, A. became practically the ruler. He was energetic, but cruel, and always untrustworthy. It is recorded that he left in his will a prize for the best history of Alexander's reign, to be written a century after the death of the emperor, and it is supposed that this part of the testament was canceled by Alexander.

ARAL, LAKE, next to the Caspian sea, from which it is separated by the plateau of Ust-Urt, is the largest lake in the steppes of Asia. It lies wholly within the limits of Russian Central Asia, between 43° 43' and 46° 44' n. lat., and 58° 18' and 61° 46' e. long. It is fed by the river Sir (the ancient Jaxartes) on the n.e. side, and the Amu (or ancient Oxus) on the s.e. It is shallow, and has no outlet. Its level is 117 ft. above that of the Caspian, and 33 ft. above that of the Black sea. Like other lakes which are drained only by evaporation, it is brackish. Owing to the shallowness of its waters, navigation is difficult; but Russian steamers have been launched upon it, and took part in the operations against Khiva in June, 1873. The history of the sea of Aral is very remarkable. Sir Henry Rawlinson and col. Yule have recently collected references made to it in Greek, Latin, Arabic, and Persian writers, and have established the fact that the area it now occupies has been dry land twice within historical times—the Jaxartes and the Oxus then running s. of the sea of Aral to the Caspian. This was the case during the Greco-Roman period, and again during the 13th and 14th centuries after Christ. The Russian government has undertaken the restoration of the Oxus to its old bed.—See *Proceedings of Royal Geographical Society*, vol. xi., vol. xvi., and vol. i. (new series, 1879); also *The Shores of Lake Aral*, by major Wood (Lond., 1876).

ARALIA, a genus of plants, the type of the natural order *araliaceæ*. This order is dicotyledonous or exogenous, and consists of trees, shrubs, and herbaceous plants, resembling the *umbellifera* (q.v.) both in their general habit and in their botanical characters, but differing essentially in the fruit, which is not *didymous* or formed of two separable carpels as in the *umbellifera*. The fruit of the *araliaceæ* consists of several one-seeded cells, and is often succulent. The order contains about 160 known species, natives of tropical, temperate, and cold climates, generally possessing stimulant and aromatic properties. Poisonous qualities are not developed as in the *umbellifera*. The herbage of many species affords good food for cattle, and some are used for human food. The genus *ARALIA* contains a considerable number of species—trees, shrubs, and herbaceous plants. It has a succulent fruit, with 5 or 10 cells, crowned with the styles. *A. nudicaulis* is a native of the United States of America, a species of humble growth, having a solitary radical leaf with a trifid stalk and ovate serrated segments; the scape is shorter than the leaf. The root is said to be equal in value to sarsaparilla as an alterative and tonic. *A. racemosa*, *A. spinosa*, and *A. hispida*, also natives of North America, produce an aromatic gum resin. *A. spinosa* is a stimulant diaphoretic. The berries, infused in wine or spirits, are employed in America as a cure for rheumatism. It is sometimes called toothache-tree; it also bears the name of angelica-tree. It is a native of moist woods in Virginia and Carolina, growing to a height of 10 or 12 ft., with a single stem, spreading head, doubly and trebly pinnate leaves and ovate leaflets, and is very ornamental in a lawn. *A. polaris*, found in the southern island of New Zealand, and in the greatest abundance and luxuriance in Lord Auckland's islands, is described by Dr. Hooker as a "very magnificent plant," a herbaceous perennial, 4 to 5 ft. high, with large orbicular masses of green foliage and waxy flowers, presenting a very striking appearance. *A. edulis*, now called *dimorphanthus edulis*, is employed in China as a sudorific. Its shoots are very delicate and pleasant when boiled; and the roots, which have an agreeable aromatic flavor, are used by the Japanese as carrots or parsnips are in Europe. *Aralias* abound in the warm valleys of the Himalaya. The natives collect the leaves of many as fodder for cattle, for which purpose they are of great value in a country where grass for pasture is scarce; but the use of this food gives a peculiar taste to the butter. Chinese rice paper has been ascertained to be cut from cylinders of the pith of an *A. Ginseng* (q.v.), the root of a species of panax, is one of the most important products of the order *araliaceæ*. The astringent roots of *gunnera scabra*, or panke, are used in tanning, but its fleshy leaf-stalks are eaten like those of rhubarb. It has been seen on the sandstone cliffs of Chiloe with leaves nearly 8 ft. in diameter, each plant with four or five of these enormous leaves. It has been introduced into Britain, and is found to succeed well in the climate of Edinburgh. The only representatives of this order in the British flora are the ivy (q.v.), and a small plant called the tuberous moschatel (*adoxa moschatellina*).

A'RAM, EUGENE, was b. in 1704 at Ramsgill, in Yorkshire. His father was a gardener, and could afford to keep A. at school only for a short time; but even while assisting his father, he contrived to gratify his passion for learning. At an early period of his life he married, and became a schoolmaster, first in Netherdale, and afterwards at Knaresborough, where he continued to reside till 1745. In the town of Knaresborough lived one Daniel Clarke, a shoemaker, and an intimate acquaintance of A.'s. On one

occasion Clarke happened to purchase a quantity of valuable goods, which he easily obtained on credit; but, to the surprise of everybody, he soon after disappeared, and no trace of him could be discovered. Suspicion lighted upon A., not as Clarke's murderer, but as his confederate in swindling the public. His garden was searched, and in it was found a portion of the goods which Clarke had purchased. A. was arrested and tried, but acquitted for want of evidence. He now left his wife at Knaresborough, and went to London, and other parts of England, in his capacity of schoolmaster; and, in spite of his nomadic mode of life, contrived to acquire a knowledge of botany, heraldry, Chaldee, Arabic, Welsh, and Irish, and was planning a great etymological work, to be entitled *A Comparative Lexicon of the English, Latin, Greek, Hebrew, and Celtic Languages*, when he was suddenly dragged away from his ushership of Lynn academy, in Norfolk, and committed to prison on a charge of murder.

The circumstances of the remaining portion of the story are pretty well known. In 1759, a skeleton was dug up near Knaresborough, which the inhabitants suspected to be that of Clarke, for they had now come to the conclusion that the unfortunate man had met with foul play, especially as A.'s wife had, on several occasions, made strange statements to the effect that her husband and a man named Houseman knew more of Clarke's disappearance than they chose to admit. Houseman was now confronted with a bone of the skeleton which had been discovered. He very emphatically denied that it was Clarke's. People naturally wondered how he *could* be so positive, the bones of skeletons being, to the uneducated eye, so similar in appearance. They became convinced that if the skeleton was not Clarke's, Houseman must know where the latter was. At last he confessed that he had been a spectator of the murder of Clarke by A. and one Terry. He named the place where the body had been hidden. It was searched, the buried skeleton was dug up, and A. was tried at York, for the murder of Clarke, on the 3d Aug., 1759. What has given so extraordinary an *éclat* to this trial, is the fact that A. conducted his own defense. He attacked, with great acumen, plausibility, and curious erudition, the doctrine of circumstantial evidence; but to no effect, for a verdict of guilty was returned, and he was condemned to be executed three days afterwards. In the interval, he confessed his guilt to the clergymen who attended him. While in the condemned cell he wrote a defense of suicide; but failed in a practical illustration of the doctrine, which he forthwith attempted.

**ARAMEA** (from the Hebrew word *Aram*, signifying the highland in opposition to the lowland of Canaan) includes the whole of the country situated to the n.e. of Palestine. Its boundaries, though not rigorously defined, were as follows: N., by Mt. Taurus; e., by the Tigris; s., by Arabia; and w., by Arabia, Phœnicia, and Lebanon. It embraced the countries known to the Greeks by the various names of Syria, Babylonia, and Mesopotamia. The *Aramaic language*, a branch of the Semitic, was common to the whole country, and was divided into two principal dialects—the west Aramaic or Syriac, and the east Aramaic, or, as it is improperly termed, the Chaldee. The former was that spoken almost universally in Palestine in the time of Christ. Ever since the Babylonian captivity, the pure Hebrew, in which the whole of the Old Testament, with the exception of a few chapters in Daniel and Ezra, had been written, had gradually given place to the Aramaic. The Aramaic version of the Bible was that used in Christ's time, who quotes from it, and not from the original Hebrew; as, for instance, the beginning of the 22d Psalm, which he repeats on the cross. The Talmud, especially the Babylonian, has a large admixture of Aramaic elements. The Aramaic dialect is, in general, the hardest, poorest, and least elaborate of all the Semitic languages, and has now almost entirely died out, and given place to the Arabic and Persian. Indeed, it is only found living among some tribes in remote districts of the mountains of Kurdistan, and in two or three villages in Syria; yet it is considered highly probable that it is the root of the whole cluster of Semitic tongues.

**ARANDA**, PEDRO PABLO ABARCA DE BOLEA, Count of, b. in 1718 of a distinguished Aragonese family, at first embraced a military career; but having evinced a remarkable spirit of observation, he was appointed by Charles III. ambassador to the court of Augustus III., king of Poland; which post he filled for seven years. After his return, he was appointed captain-general of Valencia, and in 1766 recalled to Madrid on account of its disturbed state, and the presidency of the council of Castile was bestowed on him. A. not only soon restored order in the capital, but limited the power of the inquisition, procured the expulsion of the Jesuits from Spain, and carried the salutary terror of government into the recesses of the Sierra Morena, then infested by hordes of ferocious banditti. Like many other reformers, he was not able fully to carry out his liberal intentions. In 1773, he was removed from his high position through the influence of the clergy, the Dominican monks especially, and sent as ambassador to France. Grimaldi succeeded him in his office, and after him count Florida Blanca; but when the latter lost his office in consequence of court intrigues, A. returned to his position; soon, however, to lose it again through the agency of Godoy, duke of Alcudia, the queen's favorite. He, however, still remained president of the council of state, which he had organized; but upon expressing his views regarding the war with France, he was banished to his native province of Aragon, where he d. in 1799.

**ARANEA** and **ARANEIDÆ**. See SPIDER.

**ARANJUEZ** (a corruption of the Latin *Ara-Jovis*, altar of Jupiter), a t. in the province of Madrid, Spain. It is situated on the left bank of the Tagus, 28 m. s.s.e. from Madrid, in a beautifully wooded valley, and is now connected with the Spanish metropolis by a railway. The t. is built in the Dutch style, has broad and regular streets intersecting each other at right angles, and a pop. of 3800. It is famed for its palace and gardens. The former was long a favorite resort in spring of the royal family, during which period A. occasionally reckoned as many as 20,000 inhabitants; the latter were laid out by Philip II., who built a palace also, for there was only a shooting villa here during his father's time, but a fire destroyed a portion of it, and more was taken down by Philip V., who reconstructed the edifice in French style. The present château was completed by Charles IV. On account of its gardens, the natives call A. "the metropolis of Flora." These gardens are interspersed with numerous summer-houses, the most celebrated of which is the *casa del labrador*, or laborer's cottage; but their most splendid ornament are the great elm-trees brought from England by Philip II., which thrive magnificently. They radiate out from a central plot in 12 distinct rows. A. is known historically for the treaty of alliance concluded here between France and Spain on April 12, 1772, and as the scene of the abdication of Charles IV. on March 18, 1808.

**ARANY**, János, next to Petöfi the most distinguished of modern Hungarian poets, was b. at Nagy-Szalonta in 1819. His father was a poor peasant, who spared no pains to get him into the church. In 1832, he entered the college at Debreczin, where he distinguished himself by his diligence; but unable to restrain his love of adventure, he joined, in 1836, a company of strolling-players, with whom he traveled about for several months, till, driven by necessity and an upbraiding conscience, he hurried home to do what he could for the support of a now blind and aged parent. At Szalonta he worked as a teacher of Latin and as a notary. When the Kisfaludy society of Pesth offered a prize for the best humorous poem, A. sent in anonymously his *Az elveszett Alkotmány* (The Lost Constitution of the Past). He was successful. Thus emboldened, he ventured, in 1847, to forward to the same society the first part of a trilogy, *Toldi*. Struck by the beauty of this purely national effort, the members published it at their own expense, and again rewarded the author. A. soon became a popular favorite, even in the lowest ranks of the community. In 1848 appeared his *Murányi Ostroma* (Conquest of Murány), which received less attention owing to the political excitement of the time. The poet himself took a slight part in the revolution, but after the dismal termination of the war, he was allowed to return to his country. Soon afterwards he became professor of Hungarian literature at Nagy-Koros, and then director of the Kisfaludy society, and editor of the journal *Koszorú*. The chief of his later works are *Kutalin*, the second part of *Toldi*, 2 vols. of lyrics, the first part of another trilogy, *Buda Halála*, and a humorous poem recounting his early adventures (1874). Some of his works have been translated into German.

**ARAP'AHOE**, a co. in n.e. Colorado; 4600 sq.m.; pop. '73, estimated, 25,000; in '80, 38,607. The Kansas Pacific railroad passes through, and the co. is watered by the branches of the s. fork of the Platte. The w. part is mountainous, the e. level. Mining and agriculture are the industries. Co. seat, Denver, which is also the capital of the state.

**ARAP'AHOE**, a recently formed co. in s. Nebraska, bounded on the n. by the Platte river.

**ARAP'AHOES**, an Indian tribe, dwelling on the upper waters of the Platte and Arkansas rivers, allied by language to the Caddoes. A powerful tribe half a century ago, they are now few in number and inoffensive. The French called them "Gros Ventres."

**ARAPAI'MA**, a genus of fresh-water fishes, the largest known fresh-water fishes in the world. They are found in the rivers of South America, and are sometimes taken in the Rio Negro 15 ft. in length, and of the weight of 4 cwt. They are taken with the harpoon, and are highly esteemed for food, both fresh and salted. In the salted state they have begun to form an article of commerce, and are conveyed in large quantities to Para. The genus *A.* belongs to the family of *clupeosoides*, a family of malacopterous fishes, allied to the *clupeidae* or herring family, and is remarkable for the mosaic work of strong, bony, compound scales with which the body is covered. About six species are known.

**AR'ARAT** (Airarat, in the old Armenian dialect; i.e., the plains of the Aryans), the ancient name of the fertile plateau through which flows the river Aras or Araxes. It occupies the centre of the mountainous region of Armenia, belonging partly to Turkey and partly to Russia. Notwithstanding the passage in Gen. viii. 4, where it is said that the ark rested "on the mountains of Ararat," it has become common to give the name A., not to the entire range, but to the mountain called by the Armenians *Massis Leusar*—i.e., "mountain of the ark" (known among the Turks as *Aghri-Dagh*, "steep mountain;" and among the Persians as *Koh-i-Nuh*, "Noah's mountain"). It rises in two volcanic cones, known as the greater and the lesser Ararat; the former, which attains the height of 17,212 ft. above the level of the sea, is covered with perpetual snow. It

is the highest elevation of western Asia; and since the war of 1827 it forms the point where the Russian, Turkish, and Persian territories meet. In 1840, the form of the mountain was partially changed by a frightful and destructive earthquake. Previous to this period, at the base of the mountain, and at a point where a stream runs from a wild gorge, there stood the village of Arguri or Aguri. It was surrounded by gardens and orchards, and inhabited by upwards of 1000 inhabitants. In the ravine, 2300 ft. above the village, stood the Armenian convent of St. James; and 1000 ft. higher still, a chapel dedicated to St. James. The beauty and mild air of the district made Anguri a favorite summer resort of the richer inhabitants of Erivan. It was to undergo a great change, however. On the 20th of June, 1840, dreadful shocks of earthquake were felt. Great masses of the mountain were thrown into the plain, the ravine was closed, the convent and chapel disappeared, and the village, and the gardens which surrounded it, were buried under rocks, earth, and ice, and with the inhabitants utterly destroyed. Tournefort made a partial ascent of the mountain in 1700; since then, ascents have been made in 1829 by prof. Parrot of Dorpat and his companions; in 1850 by col. Chodzko, and a large party of Russians engaged in the transcaucasian triangulation; in 1856 by major Robert Stuart; and in 1870 by Dr. G. Radde and Dr. G. Sievers. These naturalists, the former of whom is director of the museum at Tiflis, have carefully explored the mountain and district in which it is situated. See their "Reisen in Armenschen Hochland" (*Petermann's Mittheilungen* for 1871); also the *Transcaucasia* and *A.* of Mr. Bryce, who made the ascent in 1876.

**ARAS**, the ancient *Araxes*, a river of Armenia, formed by the junction of the Bingol-Su and the Kalch-Su, and uniting its waters with those of the Kur (ancient *Cyrus*) after a course of about 500 miles. The main stream is the Bingol-Su, which rises in the Bingol-Tagh, in lat. 41° 30' n., and long. 41° 10' e.; and flowing n.n.e., is joined a little below Hasan-kalch by the Kalch-Su, after which the combined stream is called the A. It then flows eastward, forming for some time the southern boundary of the province of Kars, till it is joined by the Arpa, which flows into it from the n. After this, it divides Russian and Turkish Armenia; at some distance to the s. of Erivan it turns to the s.e., along the base of Ararat; soon after which it receives the waters of the Zenghi, a river descending southward past Erivan. Near Djulfa it runs eastward for about 60 m.; after which it runs to the n.e. for upwards of 125 m., till it is joined by the large river Kur, descending from the Caucasus through Georgia. Their united waters, after a short eastward course, turn suddenly to the s., and fall by three mouths into the gulf of Kizilgatch, in the Caspian, in lat. 39° 20' n.

**ARATUS** of SICYON, a distinguished Greek statesman, was b. about 271 B.C. His youth fell among the party strifes of his native t., in which his father, Clinias, met his death; and he himself was only saved by the efforts of his aunt, who had him secretly conveyed to Argos, whence he returned, in his 20th year, and liberated Sicyon from its tyrant, Nicocles, 251 B.C. Supported by Ptolemæus Philadelphus, A. restored the republican form of government to Sicyon, and united it with the Achaian league, of which he was appointed general, 245 B.C. During his honorable but checkered career, this office was conferred on him 17 times. His great object was to unite the Greek states, and form out of them an independent nation; but this was thwarted by their mutual jealousies. A. was a brave general, a skillful tactician, and a disinterested patriot. He died by poison administered to him by command of Philip III. of Macedon.

**ARATUS** of SOLI (or Pompeiopolis, in Cilicia), wrote about 270 B.C., a Greek didactic poem entitled *Phænomena*, founded on the astronomical system of Eudoxos of Cnidos, and appended to it another poem, *Diosemeia*, giving rules for prognostication of the weather. A pure style and correct versification mark both poems, which were translated into Latin by Cicero, Cæsar Germanicus, and Rufus Festus Avienus. A. was a native of the same province as St. Paul, who quotes from him in his speech on Mars' hill: "For as certain of your own poets have said, We also are his offspring." The best edition is that by Buhle, 2 vols. Leipsic, 1793-1801.

**ARAUCANIA**, the country of the Araucos or Araucanian Indians, in the s. of Chili. The Chilian province of Arauco, lying between the rivers Biobio and Valdivia, was incorporated in 1852; but the Indians occupy a large territory in Arauco and the more southerly province of Valdivia, and still maintain their independence of the Chilian republic. The Araucanians are interesting as furnishing the only example of Indian self-government in the presence of the European races. Their country is divided from n. to s. into four parallel regions, varying from each other, with tolerable regularity, in soil and climate. These are the coast region, the plain region, the region of the lower Andes, and the region of the higher Andes. The productions of A. are similar to those of Chili. The population cannot be accurately estimated on account of the independence of the nation; but the most recent estimates set down the aboriginal population at about 70,000 souls.

A. has the proud distinction of being the only portion of the new world that has never received the European yoke. From the days of Pizarro and Almagro downwards, it has uniformly vindicated its freedom—its wars of independence having lasted, with intervals of precarious truce, from 1537 to 1773. During the war between Spain and the Chilian colonists, A. remained neutral. In 1861, a French adventurer named De

Tonneins, ingratiating himself with the Indians, was elected king of A.; and his title has been recognized by a French law court.

**ARAUCA'RIA**, a genus of plants of the natural order *coniferae* (q.v.) or pines, consisting of lofty trees, natives of the southern hemisphere, and distinguished by having the male and female flowers on separate plants, the pollen of the male flowers contained in 10—20 cases pendent from the apex of each scale, the female flowers two under each scale; each having one ovule. The species are all evergreen, the leaves broader than in pines and firs, which, however, the trees resemble in their general manner of growth. *A. imbricata*, sometimes called the CHILI PINE, a native of the Andes of Chili, forming forests on their western declivities, attains a height of 150 ft., the trunk quite straight and free from knots. The bark of the young trees is studded with leaves from the base upwards, even until 12 or 15 years of age. The branches are in whorls of 6, 7, or 8. Young trees have branches almost from the ground; old trees have tall naked stems, with a crown of branches. The female strobile (cone) is roundish ovate, 8 to 10 in. in diameter, the scales terminated by a long awl-shaped point, the seeds wedge-shaped, and more than an inch in length. The outer and inner bark of full-grown trees are each 4 to 6 in. in thickness; the outer bark of a cork-like texture; the inner, fungous and porous. From both outer and inner bark, and indeed from all parts of the tree, resin flows readily and in great abundance. The leaves are lanceolate, about  $1\frac{1}{2}$  in. in length, and  $\frac{1}{2}$  in. in breadth near the base, sharp-pointed. The timber is heavy, solid, hard, fibrous, yellowish white, and beautifully veined. It is very suitable for masts of ships. The resin, which is white, has a smell like frankincense, and a not unpleasant taste. It is applied as a plaster to contusions. The seed is pleasant to the taste, not unlike the chestnut, and is a most important article of food to the Indians. It is eaten raw, boiled, or roasted. A spirituous liquor is also distilled from it. A single strobile sometimes contains between 200 and 300 seeds, and one tree may be seen loaded with 20 or 30 of these great strobiles. This *A.* was introduced into Britain in the end of last century, and is now pretty frequently planted. It promises to add a new feature to British landscapes, as other trees of the same order, particularly the larch and spruce, have done before, and will probably prove important in an economical point of view. It is the only species which seems suited to the climate of Britain. *A. brasiliiana*, the BRAZIL PINE, has loosely imbricated lanceolate leaves, and a looser and more spreading habit than *A. imbricata*. The seeds or nuts are sold as an article of food in Rio Janeiro. The resin which exudes from the tree is mixed with wax to make candles. *A. excelsa*, now called *eutassa excelsa* (and by some *atlingia*), the NORFOLK ISLAND PINE, a native of Norfolk island, New Caledonia, etc., attains a height of 160 to 220 ft., free from branches to 80 to 100 ft., and with a trunk sometimes 11 ft. in diameter. The wood is white, tough, close-grained, and so heavy as almost to sink in water. The leaves of the young trees are linear and spreading; those of the adult are ovate, and closely imbricated. The strobiles are ovate, 4 to 5 in. in length. *A. cunninghamii*, now also ranked in the new genus *eutassa* or *atlingia*, the MORETON BAY PINE, a native of the shores of Moreton bay and banks of the Brisbane river in New South Wales, very much resembles the last. It attains a height of 60 to 130 ft., and a diameter of 4 to 8 ft. The leaves of the adult trees are lanceolate and imbricated. The wood is yellowish, and is used for boat-building, house-carpentry, and the common kinds of furniture. The large seeds of *A. bidwillii* are used for food by the natives at Moreton bay.

Certain fossil *coniferae* found in carboniferous sandstone have received the name *arau-carites*. Livingstone found a forest of large silicified trees near the Zambesi, which Mr. Quekett, on examination of specimens, ascertained to be "silicified coniferous wood of the Araucarian type." Fossil trees of the same type occur in the carboniferous strata of Britain. A trunk, for instance, 47 ft. long, was found in Craigleith quarry, near Edinburgh, in 1830.

**ARAU'CO**, a province in s. Chili between the Andes and the Pacific ocean; area 13,714 sq. m.; pop. '75, 140,896. The chief t. is of the same name, on a bay of the same name, about 300 m. s. of Valparaiso. In this department the Araucanian Indians still maintain their independence.

**ABAUJO**, D'AZEVEDO ANTONIO, afterwards count da Barca, was b. at Sá, in the neighborhood of Ponte de Lima, in Portugal, on the 14th of May, 1754. At the age of 11, he was sent to Oporto to study under his uncle, who held a high military command there. In 1787 he was appointed Portuguese ambassador to the Hague. Before entering on his duties, he visited England, where he omitted no opportunity of obtaining a knowledge of English manufactures, commerce, politics, etc. He next proceeded to Paris, where he similarly employed himself. Soon after his arrival at the Hague, he found himself entangled in political difficulties. The French revolution had broken out, but the part which he played in the complication of political affairs which ensued falls to be treated more properly under the history of Portugal (q.v.).

At length he threw up his ambassadorship, and traveled through Germany, enlarging the sphere of his studies. He paid especial attention to mineralogy and chemistry, and was fortunate enough to become acquainted with Goethe, Wieland, Schiller, Herder, etc. After the peace of Amiens, A. was sent as ambassador to St. Petersburg; in 1803 he was recalled to Lisbon, to assume the office of secretary of state; and in 1806 he obtained the

highest political dignity in the kingdom. His efforts to introduce the various agencies of civilization, while he occupied this situation, were unremitting. Glass, paper, wool, and cotton manufactures received liberal encouragement. But the sudden approach of the French army put an end to all his improvements. The royal family, which Bonaparte had formally dethroned in his victorious proclamation, emigrated to Brazil. A. embarked also, taking along with him a complete printing apparatus, his mineralogical collection, arranged by Werner, and all necessary chemical instruments. During the first years of his residence in the new world, he devoted himself assiduously to scientific and literary pursuits; founded a school of medicine and chemistry, introduced the cultivation of tea, an improved machine for sawing wood, and a sugar-alembic, and established a porcelain manufactory. He had also a magnificent garden, the plants of which were scientifically arranged. He died on the 21st June, 1817.

**ARAUURÉ**, a t. of Venezuela, South America. It is situated in lat.  $9^{\circ} 17' \text{ n.}$ , long.  $69^{\circ} 28' \text{ w.}$ , 60 m. e.n.e. of Trujillo, in a region noted for its fertility in the production of cotton, coffee, cattle, etc. The t. itself is rather handsome, and contains 10,000 inhabitants.

**ARAVUL'LI**, a range of mountains in western India, extending from about  $22^{\circ} 40' \text{ n.}$  lat.,  $74^{\circ} \text{ e.}$  long., to  $26^{\circ} 50' \text{ n.}$  lat.,  $75^{\circ} \text{ e.}$  long. The highest summit is Abu (q.v.). The north-eastern extremity of the range sinks into comparatively low rocky hills. The north-western side is very bold and precipitous, the south-eastern less so. There is no road practicable for wheel-carriages across this range for a distance of 220 miles.

**ARAXES**. See **ARAS**, *ante*.

**ARBACES**, one of the generals of Sardanapalus, and the founder, 876 B.C., of the Median empire. In conspiracy with a Chaldean priest who commanded the troops from Babylon, he revolted, gained the assistance of several prominent officers, and defeated Sardanapalus, who committed suicide. The dynasty of A. lasted until 559 B.C., when Cyrus overthrew it.

**AR'BALEST**, **ARCU'BALEST**, or **CROSS-BOW**, was a weapon much in use during the feudal times. Its recognized position among military arms may be dated from about the period of Richard I. The smaller kinds of A. were bent by pressing the hand on a small steel lever called the "goat's foot;" but the larger kinds were bent by placing the foot in a loop or stirrup at the end of the central shaft, and drawing the cord upwards with the hand. At a later period, the bow was made very strong, often of steel; in this form it required a mechanical contrivance, called a "moulinet," to bend it. Sometimes ordinary arrows were used with the A., but more usually arrows of a shorter and stouter kind, called "carrials" or "quarrels," were employed; these had a four-sided pyramidal form of head. Occasionally stones and leaden balls were shot from the larger arbalests. The arbalesters, or cross-bowmen, carried a quiver with 50 arrows as an armament in some of the battles of the 13th century. They were an essential component of armies of that period, taking up their position in the van of the battle array; some were mounted, some on foot, and they occasionally wore armor. The supply of arrows or quarrels was carried after them to the battle-field in carts. The A. continued to be a favorite weapon in England throughout the 13th c.; but in the 14th it gave way to the long-bow, which was found to be a more convenient weapon in battle. The long-bow is described under **BOW AND ARROW**: and the general military system to which it belonged, under **ARCHERS AND ARCHERY**.

**ARBALESTINA**, in the military system of the middle ages, was a small window or wicket through which the cross-bowmen shot their quarrels or arrows at an enemy besieging a fortified place.

**ARBELA**, now Erbil or Arbil, a small t. of Assyria, e. from Mossul, famous as having given name to the battle in which Alexander finally defeated Darius, 331 B.C. The battle was really fought near Guagamela (the "camel's house"), to the n.w. of A.

**ARBITRAGE**, comparing and settling accounts, and arranging disputes, applied both to a calculation and to a trade. As to calculation, A. relates to the simultaneous values at any particular moment of any specified merchandise in one market in terms of the quotations on one or more markets, exchange considered. As to trade, A. relates to the business, founded on such calculations, of buying or selling wholesale in the cheapest market for the time being, and simultaneously re-selling or buying. A. proper is a distinct and well-defined business, with three main branches, viz.: A. in bullion or coin, in bills and exchanges, and in shares or stocks.

**ARBITRATION** is the adjudication by private persons appointed to decide a matter, or matters in controversy, on a reference made to them for that purpose, either by agreement of the disputants or by the order, or on the suggestion, of a court of law. The proceeding generally is called a *submission to arbitration*, or *reference*; the parties appointed to decide are termed *arbitrators*, or *referees*; and their adjudication is called an *award*. This mode of settling disputes is not only frequently resorted to by litigants themselves, who are anxious to avoid the delay and expense of proceedings in the public tribunals, but the statute-book bears witness to the approval of it by the legislature at various times. An old act, the 9 and 10 Will. III. c. 15, testifies the benefits

of A. in strong terms, declaring that "it hath been found by experience that references made by rule of court have contributed much to the ease of the subject in the determining of controversies, because the parties become thereby obliged to submit to the award of the arbitrators," and it proceeds to authorize and encourage merchants, traders, and others to put an end to their controversies and quarrels by means of A.; and a modern act, passed in 1833, the 3 and 4 Will. IV. c. 42, ss. 39, 40, and 41, contains still more anxious provisions for rendering references to A. effectual. Since that act was passed, the practice and feeling in favor of A. has increased, so much so that there are recent statutes which contain provisions rendering A., or private reference in certain cases, compulsory. The railway acts of 1845, the public health act of 1848, common law procedure act of 1854, and masters and workmen acts are modern examples of this legislative peculiarity.

The matters that may be determined by an arbitrator are all personal disputes and differences which might otherwise be made the subject of controversy in the courts of civil jurisdiction. Thus breaches of contracts generally, breaches of promises of marriage, trespass, assaults, charges of slander, differences respecting partnership transactions or the purchase price of property, and questions relating to tolls or the right to tithes, may all be referred to A. Questions relating to real property may also be referred, such as those relating to the partition of lands of joint tenants or tenants in common, to settlements of disputed boundaries—to differences between landlord and tenant respecting waste—and to the title to land. Pure questions of law may also be referred to the decision of an arbitrator. An arbitrator may have, therefore, to determine the liability of a party on a promissory note or bill of exchange, or to construe an act of parliament, or to give a judicial opinion on the effect of a will or deed. Actions at law, and suits in equity, may also be settled by A.; and this kind of reference may be made at any stage of the proceedings, sometimes even after verdict, and probably by analogy, after decree in equity. Questions relating to the future use and enjoyment of property, and future or anticipated differences between parties, may likewise be referred.

A matter, however clearly illegal, cannot be made the subject of a valid reference. But where transactions between parties have been brought to a close by a general award, apparently good, the courts have refused to reopen them on a suggestion that some legal item has been admitted in account.

There are certain matters which are specially referred to A. by statute. Besides those we have already alluded to, the following matters are all referable to A.: Questions relating to the expenses of prisoners, under 28 and 29 Vict. c. 126; to the regulation of municipal corporations in England and Wales, under the 5 and 6 Will. IV. c. 76; to the laws concerning prisons, under the 5 and 6 Vict. c. 98; to disputes between masters and workmen, under the 5 Geo. IV. c. 96, amended by 35 and 36 Vict. c. 46; to the laws relating to savings-banks, under the 26 and 27 Vict. c. 87; to the land rights and other possessions of certain ecclesiastical and collegiate corporations, under the 2 and 3 Will. IV. c. 80; to the management and improvement of episcopal and capitular estates in England under the 17 and 18 Vict. c. 116; to the conveyance of mails by railways, under the 1 and 2 Vict. c. 98; to insolvents and to insolvency, bankruptcy, and execution, under the bankruptcy act, 1869, 32 and 33 Vict. c. 71; to the constitution of companies incorporated for carrying on public undertakings, under the 8 and 9 Vict. c. 16; to the taking of lands for undertakings of a public nature, under 8 and 9 Vict. c. 18; to the metropolitan sewers, under the metropolis management acts, 18 and 19 Vict. c. 120, 19 and 20 Vict. c. 112, 25 and 26 Vict. c. 102, and 34 and 35 Vict. c. 47; to friendly societies, under the 17 and 18 Vict. c. 56, and the 38 and 39 Vict. c. 60.

Under these acts of parliament, the class of cases which may, or which must, be referred to A., have been greatly enlarged. The railway acts, in particular, have largely contributed to this kind of amicable determination, although the parties in such cases cannot be said to have much discretion in the matter. Under the provisions, again, of the judicature act, 1873, and the act 17 and 18 Vict. c. 125, ss. 3 and 6, parties may be compelled by the court to refer to official referees matters which involve intricate accounts or scientific or local examination.

Among the questions that cannot be referred to A., are matters arising out of the administration of the criminal law in the case of felonies and relating to agreements or transactions against public policy. Felonies and offenses of a public nature cannot be referred, because the public safety and good require them to be punished, and for this purpose they can only be properly tried in one of the ordinary courts of the country.

With respect to matters which cannot be referred on account of their being against public policy, the rule is so obviously just that no illustration is required.

But there are certain misdemeanors which may be either settled by agreement or by means of an A., on a principle of very general application stated by chief-justice Gibbs—that where there is a remedy, by action as well as by indictment, a reference of the matter in controversy is good. And in these cases of misdemeanor, a compromise or settlement under a reference may be made, even after conviction, but with the sanction of the court.

As to the parties who may make a reference to A., it may be stated generally, that every one capable of making a disposition of his property or release of his rights may make a submission to an award, and in this category may be placed a married woman,

who has a separate estate settled to her separate use, and there are even cases where a reference between a husband and wife has been held valid; and of course a husband may submit to A. differences respecting his wife's personal estate which has not been settled to her separate use.

Respecting the powers of infants or persons under age to submit to A., there are numerous decisions in the courts of law and equity: but they go upon refinements and nice distinctions more suited for the professional lawyer than for the ordinary reader, and we therefore do not think it necessary to give any explanation of them in a popular article such as this professes to be.

Partners and corporations may make references to A. on the principles already explained, and according to the relation in which they stand to the matter in dispute.

Those who cannot submit to A. are persons in the following positions: Persons who cannot contract; married women without any estate settled to their separate use; and along with them, as laid down in old ante-reformation books, persons professed in religion, and persons under duress. There is an exception to the incapacity of married women to refer to A. where the husband, by exile, banishment, or other cause, is held to be civilly dead, and when he is an alien enemy. To these exceptions it may be added, that in suits respecting the property of charities the court of chancery will not permit a reference, however advisable such a course may seem, unless the attorney-general gives his consent.

It has generally been the opinion of the legal profession, and held to be the doctrine of the courts, that a reference by the consent of counsel in a cause is binding on his client; and lord chancellor Eldon once said, that it was for the counsel to consider whether he was authorized to refer, and if so, he (the chancellor) would act on the consent so given; and the right and privilege of counsel to make a reference has been very strongly laid down in the Scotch courts. But a very recent case in the court of common pleas (*Swinfen v. Swinfen*), where a compromise by counsel was successfully resisted by the client, has very much unsettled the English law on this subject; and now the feeling of the bar in England is, that it is unwise to refer or compromise a litigation on the independent authority of counsel.

Submissions to reference may also be made by executors and administrators, by trustees, by the committee of a lunatic, and by the officer of a public company, who is authorized by a statute to sue and be sued in the name of the company. And there are persons especially empowered to refer by the statutes which we have already enumerated.

Disputes may be referred to A. in any manner that expresses the agreement or understanding of the parties to be bound by the decision of the arbitrator; and for this purpose no formal submission, either verbal or written, is necessary; but the arrangement must be such as manifestly to show an intention to have the difference concluded by a private adjudication in the nature of an award. But where the submission is in writing, it must be executed in due form. A testator, however, cannot exclude his will from litigation by a proviso, that all differences respecting it shall be referred to A., although it is thought that the parties benefited by the will might themselves so refer. Generally speaking, it is advantageous to make the A. in such a form as that the award may be made a rule of court—that is, may be adopted by a court of law as its judgment on the matter submitted, a proceeding that affords an obvious facility in enforcing the award; and for this purpose it is necessary to make the procedure conformable to the directions of the statutes 9 and 10 Will. III., and 3 and 4 Will. IV., already referred to. Where the submission is merely verbal or constituted by a private bond or deed, it is liable to be capriciously revoked, and proceedings on the award, in such a case, can only be taken in the court of chancery.

The arbitrator ought to be a person who stands perfectly indifferent between the disputants; but there are no other particular qualifications for the office. And the choice by parties of the person who they agree shall decide between them, is perfectly free. Some legal writers have even gone so far as to maintain, that not only infants and married women, but even idiots and lunatics, can be arbitrators, on the argument that every person is at liberty to choose whom he likes best for his private judge, and he cannot afterwards object to the deficiencies of those whom he has himself selected. But this, it is clear, is going too far, and the policy of the law would certainly be interposed against such extreme cases. It is better to state the rule to be, that on the condition that the party selected is of ordinary intelligence, the choice of an arbitrator is absolutely unfettered. The only exception to this rule is the case of a party who, by office or position, is the person pointed out for the duty under a reference made by statute. In matters of complicated accounts, mercantile men are generally preferred. In other cases, it is usual to appoint barristers who, being accustomed to judicial investigations, are able to estimate the evidence properly, to confine the examination strictly to the points in question, and, in making the award, to avoid those informalities in respect of which it might afterwards be set aside. Both time and expense are thus saved by fixing on a professional arbitrator. It has, indeed, been wisely remarked, that an arbitrator should endeavor to arrive at his conclusions upon the same rules and principles which would have actuated the court for which he is substituted—a rule of conduct that obviously points to the expediency of a lawyer being the referee. But an arbitrator is not bound by the mere rules of practice which prevail in the ordinary courts of justice,

and he has been held justified in allowing interest on both sides of an unliquidated account, although such a determination was against the practice of the court of chancery, where the suit, which had been referred, had been commenced.

The proceedings before an arbitrator are regulated according to the peculiar circumstances of the case submitted, but generally it is advisable to conduct them according to the forms observed in courts of law, and they usually are so conducted. Each of the parties furnishes the arbitrator with a statement of his case, which is done by giving him a copy of the briefs on each side; and on the day appointed he proceeds to hear them (either in person or by their counsel or attorneys), and to receive the evidence on each side, nearly in the same manner as a judge at an ordinary trial. Having so heard the case, the arbitrator proceeds to make his award, which need not necessarily be in writing, for a verbal award is perfectly valid; but in practice it is usual for the arbitrator to make his award on paper stamped with the proper award stamp, and this he delivers to the successful party. The unsuccessful party gets a copy of the award on unstamped paper. This award in its effect operates as a final and conclusive judgment respecting all the matters submitted, and it binds the rights of the parties for all time.

An award may be set aside on the ground of corruption and fraud in the arbitrator, and for any material irregularity or illegality appearing on the face of the proceedings. But the tendency of the courts is to favor arbitrations and maintain awards, unless such serious grounds as we have referred to can be substantiated.

Where there are two arbitrators, the submission often provides that in the case of their differing in opinion the matter referred shall be decided by a third person, called an umpire, who is generally appointed under a power to that effect, by the arbitrators themselves. But they cannot make such an appointment unless specially authorized so to do by the terms of the submission. This umpire rehears the case, and for this purpose is invested with the same powers as those possessed by the arbitrators, and bound by the same rules.

In Scotland an A. takes place in virtue of a written submission executed by the parties in favor of the chosen referee, who there is called an arbiter, instead of arbitrator, as in England; and his award is called a decree-arbital. This submission is in the form of a regular deed, and is said to be general or special, according to the nature of the matters submitted by it, the submission specifying all the particulars of the reference, and the name of the referee—the arbiter's powers and duties, which, in the ordinary case, are of the most comprehensive character—the specification of the time within which the award or decree-arbital is to be made—a clause obliging the parties to perform the award under a specified penalty; and other anxious provisions, which are all carefully specified in the submission. The case then proceeds before the arbiter, generally according to the forms observed in the ordinary Scotch courts; and the arbiter makes his award in a very solemn manner, the decree-arbital commencing with a recital of the submission and of all the procedure—and after stating that the arbiter has ripely considered the whole matter, and has "God and a good conscience before his eyes," it gives the arbiter's judgment, and among other things ordains the submission and decree to be recorded according to the clause of registration in the former, and the extract from the registry so made forms a judgment which may be put in execution by either party against the other. The decree-arbital, like the submission itself, must be executed and attested in the form of a regular deed. Where there are two arbiters, the submission usually provides, that in the event of their differing in opinion, they shall name an umpire or oversman, as he is called in Scotland, whose judgment is final.

In conclusion, and as a remark on A. generally, it only remains to be stated, that of course, from the nature of the case, there can be no appeal on the merits of the dispute submitted to any public tribunal whatever.

**ARBITRATION** (*ante*). In the United States A. is under much the same laws as in England, but some recent decisions are noteworthy. The New York court of appeals holds as void an article in the constitution of a private society, which made certain members a court to judge of violations of the rules, with power to forfeit the offender's rights in property; regular courts would not enforce the decision of tribunals organized by private agreement, except where the person affected expressly agreed to submit the matter in dispute to A. Some states exclude certain matters from A., as in New York, where claims to life estates, whether in fee or in realty, cannot be submitted, the object of the law being to preclude from unlearned arbitrators questions depending upon strictly technical points. The old rule that married women could not enter into A., is practically obsolete, as most of the states have recently enacted laws which put women nearly on the plane with men in the holding and disposition of property. The question, whether one partner in business can bind another in an agreement to arbitrate, is not definitely settled, but the drift of authority is against such power, though it is held that the contracting partner is bound, and the partner's refusal to fulfill the award may cost thereon-tractor in damages. Forms of agreement are unimportant, and may be merely verbal without written documents; and the omission of an arbitrator to be sworn is held as only an irregularity. Hearings in A. must be on notice to both sides; where *ex-parte* they are void. If there is to be an umpire he must be chosen before the hearing. All the arbi-

trators must agree in the award, unless other provision is specially made, and awards must be specially conclusive and final. All states have laws provided for setting aside or overruling the decisions of arbitrators for partiality, fraud, or any misconduct, on appeal to a regular court; and courts may correct mistakes or other imperfections in awards. Some states provide that awards may be vacated for any legal defect. In a few states, laws provide that neither party shall revoke his submission to A. without consent of the other; some provide that no revocation shall ensue after the case has been submitted to the arbitrators upon evidence; in some states the rules are less stringent, and a party may revoke his consent at any time, incurring only the accrued costs, but this seldom happens. Submission to A. suspends the right of suing on the pending cause of action, and a legal award bars the right of suit altogether. If awards are honest and fair, the courts will not vacate them because of mere errors of statement. Justice Story gives decision that arbitrators may make their judgment on the principles of equity and conscience rather than on legal technicalities. In Pennsylvania, a party in a civil action may compel the submission of it to A., with or without the consent of the other party. In New York city there is a "board of brokers" in whose articles of association is a section providing for A. in certain cases. The courts have held that this section is nothing more than an agreement in general terms to submit, and have declined an application to compel a member to such submission, since his refusal was merely an exercise of his power of revocation. A. in international affairs is of long standing, and growing rapidly in favor. Some statesmen look to its general adoption as the happy substitute for war; but so far, questions of only secondary importance have been thus settled. One of the first in American history was the case of the privateer *General Armstrong*, in which the first Napoleon acted as arbitrator; and the latest and most important concerned the United States—the "Geneva award," or the settlement of the "Alabama claims," against England. A treaty was concluded providing for five arbitrators, to be named by the president of the United States, the queen of Great Britain, the president of the Swiss republic, the king of Italy, and the emperor of Brazil. All the judgments were in favor of the United States, and all the arbitrators agreed except lord chief-justice Cockburn of England.

**ARBOGA**, an ancient city in Sweden, in the province of Westmannland, on a small river of the same name, by which, with the aid of a canal, the lakes Hjalmar and Mälar are united. A. used to be an important commercial town, but it has now sunk into insignificance, and only possesses an historical interest from the antiquities in its neighborhood. Of all its churches, cloisters, and chapels there only now remain the town and parish churches, the former with an altar-piece of Rembrandt's. Several kings of the family of Vasa have resided here. Church assemblies were held here in 1396, 1412, 1417, 1423, and 1474; diets in 1435, 1440, 1471, 1529, and 1561, in which last year also certain articles, known as the Arboga articles, were passed by which Eric XIV. was enabled to limit the power of the nobles; and in 1625, Gustavus Adolphus issued an edict here, commanding that the copper coin of the realm should contain its full worth of copper. Pop. '72, 3393.

**ARBOIS**, a t. in the department of Jura, France, in a deep valley on the Cuisance, 940 ft. above sea-level; famous for its wines, which were exempted from taxation in 1493, by Maximilian I. It has trade also in brandy, grain, oil, fruits, cattle, and cheese, and manufactures of paper and leather. It had once a commandery of the knights of Malta, two monasteries, and three nunneries, and still possesses a college and the ruins of a castle. Pop. 6000 to 7000.

**ARBORESCENT** (from Lat. *arbor*, a tree), a term applied to plants to signify that they possess either altogether, or in some measure, the character of trees. Even the dwarf willows and birches, on the confines of polar or alpine perpetual snow, are described as the A. vegetation of these regions.

**ARBORICULTURE** (from Lat. *arbor*, a tree), a term literally signifying the cultivation of trees, but in use generally restricted to the planting and management of timber-trees, or employed as exclusive at least of the cultivation of fruit-trees, which is a branch of horticulture or gardening.

The ancients practiced A. to some extent, but chiefly with the view of beautifying their villas, or of forming public walks in the vicinity of cities. It is only for similar purposes, and on a very limited scale, that A. is yet anywhere practiced in America. The planting of timber trees for economical purposes, or with a view to profit, is unnecessary whilst natural forests are abundant, and can scarcely be referred even in Britain to an earlier period than the beginning of the 16th c., nor did it become at all general till a much later date. The early forest laws of England, as of other feudal countries, had reference chiefly to game, for the sake of which it was, and in order to the enjoyment of the chase, that large tracts were depopulated and converted into *forests* by the first Norman kings. Plantations for timber and fuel were, however, certainly made in England in the 16th c.; and the importance of the subject was urged on public attention by authors of that period. In the 17th c., the greatly increased demand for oak, for the building both of ships and of houses, gave a new impulse to A., which attracted more than ever before the attention both of the government and of the great landowners; the publication of Evelyn's *Sylva* also did more than any previous work to

promote a taste for it. It was in this century that nurseries for forest trees were first established. It was not until the beginning of the 18th c. that the first extensive plantations were made in Scotland, nor until towards the end of that century that A. became general in that country or in Ireland. How much the very landscape has been changed by it—how great a difference has been made by the conversion of bleak hills and barren wastes into woods—how much the scene has been changed by the new forms of foreign trees, some of which are now in many districts more abundant than those which are indigenous, it is not easy to imagine; and how much these changes have promoted and are indicative of improvements in agriculture and increased productiveness of fields, is equally difficult to estimate.

The A. of France, Germany, and other parts of Europe, to this day, consists in a great measure of the management of natural forests; and in the more eastern parts of the continent this is almost exclusively the case. Without a careful management of the natural forests, many districts of France and Germany would soon be destitute of fuel; by means of it an increased supply of valuable timber is also obtained; and extensive domains belonging to the state, or to private proprietors, are rendered much more productive. It is in Germany that the management of the forests has received the greatest attention, and has been most systematically and scientifically conducted.

The forest trees of Britain, and of temperate climates generally, are conveniently divided into two classes—the one consisting of coniferous trees or pines and firs (*nadelholz*, i.e., the “needlewood” of the Germans), the other including all other kinds (*laubholz*, i.e., the “leaf-wood” of the Germans); the latter being sometimes subdivided into *hard-wooded trees*, of which the most important in Britain are oak, ash, elm, beech, birch, hornbeam, sycamore, walnut, and chestnut; and *soft-wooded trees*, as willow, poplar, lime, alder, and horse-chestnut. Of these and other trees, of their particular uses, and of the soils and situations to which they are adapted, notice is taken in separate articles.

Plantations are generally formed in Britain by means of trees raised from seed in a nursery; but sometimes also by sowing the seed on the ground intended for the plantation; in which case, if circumstances permit, a crop of grain is often sown along with the seeds of the trees, as these do not in general vegetate very soon; and the young plants derive advantage from the absence of choking weeds when the grain-crop is reaped, and from the protection afforded by the stubble. It has been supposed by some, but there is no sufficient evidence in support of the opinion, that more healthy and vigorous trees are obtained by sowing on the spot than by planting those which have been raised in a nursery. However, only very young trees can be planted with advantage, those which have attained a greater size requiring a degree of attention far beyond what is possible in plantations even of very moderate extent. The time of planting is from November to February. The most approved mode of planting is in small pits, in which the roots are disposed in a natural manner, and which are then carefully filled up with earth; but it is often thought sufficient when the tree to be planted is very young, to make a slit for it with the spade, or two slits, one at right angles to the other in the form of the letter T. Other methods are also adopted, particularly for rocky situations, in which the spade cannot be used. Economy is often a consideration of great importance in determining the mode of planting.

The formation of plantations by the sowing of seed has been more generally practiced on the continent than in Britain. In this way the vacancies in the natural forests of France and Germany are filled up. In this way also great sandy tracts have been covered with wood on the coasts of Pomerania and of France. This has particularly been accomplished on a scale of extraordinary magnitude in the downs of drifting sand, between the rivers Adour and Gironde. The operations there were begun by M. Bremon tier in 1789, and deserve to be mentioned as perhaps the most important operations in A. that have ever been performed in the world. Vast forests of pinaster now occupy what was originally loose sand destitute of vegetation.

Too little attention has hitherto been generally paid to the adaptation of the kinds of trees that are planted to the soil and climate; and to this cause many failures in A. are to be ascribed. Some trees grow well even in exposed situations, and are fit to be employed in these, either to form entire plantations, or to occupy the outer part, and so to shelter other trees, which in general are not planted until the outer zone or belt of the most hardy kinds is somewhat advanced; some succeed only in rich soils; some are incapable of enduring the sea-breeze; others, as the sycamore, the elder, and the pinaster, are comparatively unaffected by it. Some trees suffer from an amount of moisture from which alders or willows would rather derive advantage; but, in general, the thorough drainage of the land intended for a plantation is one of the circumstances most important to its success.

To the necessity of this thorough drainage we must look as compensating, or more than compensating, the influence which woods exercise in condensing the moisture of the atmosphere, and in rendering a climate cold and damp; marshy soils being in this respect still worse. The shelter afforded by plantations judiciously disposed, whether in belts or otherwise, is also of great importance in rendering them suitable for that improved agriculture in which thorough drainage is of the first necessity, and which is always productive of amelioration of climate. The influence of plantations is, therefore, upon the whole, beneficial, although vast masses of forests are injurious to climate;

and it must be admitted that in some localities the planting of trees has been carried to excess, so that fields often suffer, particularly in autumn, from want of free circulation of air, and the landscape is often restricted to very narrow limits. The remedy in such cases is obvious; and it not unfrequently happens that within a short distance new plantations might be formed with every prospect of benefit.

Much has been written about the pruning of forest trees, with a view especially to the production of taller and straighter stems; and considerable difference of opinion exists as to the extent to which pruning should be practiced. It is, however, very generally delayed till the branches to be removed have attained too great a size, and is then very rudely performed, to the spoiling of the timber rather than to the improvement of it. The practice of leaving *snags*, instead of cutting branches clean off, has particularly bad effects. Pines and firs, from their manner of growth, need pruning less than trees of other kinds. When trees have been planted, not merely for profit but for ornament, this ought to be remembered in pruning, which, however, is too often intrusted to persons utterly devoid of taste; and trees which, as they naturally grew, were very beautiful, are so treated with axe and saw that they become deformities instead of adorning the scene.

In forming plantations, different kinds of trees are very generally mixed, although masses of one particular kind are also frequently planted. It is usual, however, to plant along with those which are destined most permanently to occupy the ground, trees of other kinds as *nurses*, to be gradually removed as the plantation advances in growth. For this purpose, spruce and larch are more generally employed than any other tree; although Scotch fir and birch are also deemed suitable for certain situations. The removal of some of these nurses affords the first returns of profit from the plantation, which is afterwards thinned from time to time. Plantations far more frequently suffer from being thinned too little, than from being thinned too much. To the want of proper thinning is to be in part ascribed the failure of many of those narrow belts of *planting* which are too common in Scotland, and which, having been intended for shelter, very imperfectly serve their purpose, and seem to have suffered from the hardest usage themselves. The thinning of a plantation which has been allowed to grow too thick, must, however, be very gradually performed, that it may be beneficial, and not injurious. After a sudden thinning, a plantation sometimes ceases to thrive, and many trees are often laid prostrate by the next storm; for trees accommodate themselves both in their roots and branches to the situations in which they grow.

A considerable number of years must elapse before any pecuniary return is derived from a plantation, yet this mode of employing soils is often found to be the most remunerative of which they are capable, even without reference to the improvement of adjacent lands to which shelter is afforded; and the increased demand for timber in Britain, for *sleepers* of railways and other purposes, tends to the still further encouragement of A.

The resinous products of pine-woods are not considered as a source of profit in Britain; but the tar, turpentine, and resin obtained from them in some parts of Europe, form articles of commerce. The great pinaster plantations already mentioned, on the sands between the Adour and Gironde, now yield products of this kind in large quantity. The employment of trees for ornamental purposes belongs not so much to A. as to landscape gardening (q.v.). The transplanting (q.v.) of large trees is only practiced for ornamental purposes. Hedgerow trees are planted chiefly for ornament, although sometimes they may afford useful shelter; but where this is not the case, they can seldom be reckoned profitable, as they are injurious to crops. Copse or coppice-wood differs so much, both in its uses and in the mode of its management, from other plantations, that it must be briefly noticed in a separate article.

**ARBORICULTURE** (*ante*). The wholesale destruction of forests in the United States long ago attracted attention in the older states, and measures have been taken to remedy and counteract the evil. The most efficient of these is A., which is now well developed in the eastern, middle, northern, and western states. It is estimated that, even in New York, timber has been destroyed at the rate of 150,000 acres per year, most of the wood going for railroad-fuel and building. Landowners, however, are growing more careful, and the young trees, once grubbed out as worthless brush, are now very generally not only spared but nursed. The ordinary process with natural growth is to exclude browsing cattle, and then thin out, taking the crooked and damaged first, and next such as will make hoop poles, hay stakes, etc. The timber left will grow more rapidly and will be more handsome and valuable than a full natural growth. With care, the growing trees may be grouped in lines, and ample wagon roads be left for ease of communication with highways or other fields. Raising trees from seed takes more time and care, but will furnish better timber and larger profit. In this practice the ground is prepared as if for corn, and the seed sown by hand or drill in hills or rows. For a year or two, corn and trees may grow in alternate rows, if desirable to get immediate profit from the land. Large seeds, like chestnuts and walnuts, are planted about three or four times their own diameter below the surface. Evergreen seedlings must be shaded through the first summer, removing the shade occasionally that the plants may be hardened. Not much is done in the way of transplanting in the older states, except for parks and orna-

mental purposes. In Minnesota and other western states, the successful culture of trees is accepted in lieu of certain taxes, and millions of trees are transplanted annually. It is important to preserve old or raise new trees in thick belts or ranks for the protection of houses, crops, and cattle, against heavy winds and storms. Such protection often saves the half or nearly the whole of winter grain. Where such belts should be planted depends upon the situation of the farm with reference to the prevailing direction of the winds. Simply for ornamentation, A. is largely practiced, and is growing in importance, and men of knowledge and experience are employed for the purpose in public and private parks and cemeteries.

**ARBOR VITÆ**, *Thuja*, a genus of plants of the natural order *conifera*, allied to the cypress, and consisting of evergreen trees and shrubs with compressed or flattened branchlets—small, scale-like, imbricated leaves—and monœcious flowers, which have 4-celled anthers, and the scales of the strobiles (or cones) with two upright ovules.—The common A. V. (*T. occidentalis*) is a native of North America, especially between lat. 45° and lat. 49°, but has long been well known in Europe. It is a tree of 40 to 50 ft. high; its branches are horizontally expanded, and the strobiles (cones) small and obovate. The young leafy twigs have a balsamic smell, and both they and the wood were formerly in great repute as a medicine; the oil obtained by distillation from the twigs, which has a pungent and camphor-like taste, has been recently recommended as a vermifuge. The wood of the stem is reddish, soft, and very light, but compact, tough, and durable, bearing exposure to the weather remarkably well. The tree is very common in Britain, but planted chiefly as an ornamental tree, and seldom attaining so great a size as in its native country. It delights in cool, moist situations.—The CHINESE A. V. (*T. orientalis*), a native of China and Japan, which is immediately distinguishable from the former species by its upright branches and larger, almost globose and rough strobiles, is also in Britain, and upon the continent of Europe, a common ornament of pleasure-grounds; but it does not attain so great a size as the preceding, and is more sensible of the cold of severe winters. The balsamic smell is very agreeable. The tree yields a resin, having a pleasant odor, to which high medicinal virtues were formerly ascribed; hence the remarkable name *arbor vitæ* (Latin, signifying tree of life), given to this species, and extended to the genus. Other species are known, but they are less important than these. In its native country, this species also attains the size of a considerable tree.—There are several other species of *Thuja*, some of which seem well suited to the open air in the climate of Britain, and others require the protection of green-houses. Amongst the former are *T. plicata*, from Nootka sound; and *T. dolabrata*, a native of Japan, a tree of great height and thickness, and which will not improbably prove the most important of the whole genus.—A tree, common in North America, and there known by the name of WHITE CEDAR, is sometimes included in the genus *Thuja*, under the name of *T. sphaerodea*, but is more generally ranked in the genus *cupressus* as *C. thyoides*. See CYPRESS. The timber is highly esteemed, and an infusion of the scrapings is sometimes used as a stomachic.—Closely allied to the genus *Thuja* is *Callitris*. See SANDARACH.

**ARBROATH**, ABERBROTHWICK, or ABERBROTHOCK, a seaport t. in the e. of Forfarshire, situated at the mouth of a stream called the Brothock. Here king William the Lion founded a Tyronensian abbey in honor of Thomas à Becket in 1178. The king was interred in it in 1214. In the abbey, Bruce and the Scottish nobles met in 1320, to resist the claims of Edward II. to Scotland. Cardinal Beaton was the last of its abbots. Next to Holyrood, the abbey was the most richly endowed monastery in Scotland. It was destroyed by the reformers in 1560. Its ruins—which are cruciform, 270 by 160 ft.—are very picturesque, presenting lofty towers, columns, gothic windows, and a fine circular east window, “the Round O of A.” The chief industries of A. are flax-spinning, jute-spinning, and the manufacture of sail-cloth. The new harbor, begun in 1841, admits vessels of 400 tons; it is protected by a breakwater. In 1878 the number of vessels belonging to the port was above 60, tonnage about 11,000. The chief exports are grain, potatoes, fish, pork, and pavement, chiefly from Lower Devonian quarries 8 or 10 m. inland. A. is a royal burgh, and in conjunction with Montrose, Brechin, Forfar, and Bervie burghs, returns one member to parliament. Pop. in 1871 of parliamentary burgh, 19,973. A. is supposed to be the Fairport of *The Antiquary*, and the Redhead crags and coves form some of the scenes in that novel. The famous Bell-rock light-house stands in the sea, 12 m. s.e. of Arbroath.

**ARBUTHNOT, JOHN**, a distinguished writer and physician, the contemporary and friend of Pope and Swift, was the son of a Scottish Episcopal clergyman; and b. at Arbuthnot, in Kincardineshire, shortly after the restoration. He studied medicine at Aberdeen, where he took his degree. A.’s father was obliged to resign his charge at the revolution. His sons’ prospects being thus blighted in their own country, they were under the necessity of going abroad to seek their fortune. John removed soon after to London, and there supported himself by teaching mathematics. In 1697, he published an examination of Dr. Woodward’s account of the deluge, which brought him into notice as a person of no common ability. Accident called him into attendance on prince George of Denmark, who thenceforth patronized him. In 1709, he was appointed physician to the queen, and in 1710 was elected a member of the Royal college of

physicians. On the death of queen Anne, in 1714, he lost his situation, and his circumstances were never so prosperous afterwards. In 1717, A., along with Pope, gave assistance to Gay in a farce, entitled *Three Hours after Marriage*, which, however, in spite of having the aid of a trio of wits, proved a complete failure. In 1723, he was chosen second censor of the Royal college of physicians; in 1727, he was made an elect, and had the honor to pronounce the Harveian oration for the year. He died at Hempstead, in 1735. A. was one of the leaders in that circle of wits which adorned the reign of queen Anne, and was still more nobly distinguished by the rectitude of his morals and the goodness of his heart. He assisted Swift and Pope in the composition of that brilliant satire, the *Memoirs of Martinus Scriblerus*, contributing those portions of it which refer to science and philosophy; and he was undoubtedly the author of the celebrated political *jeu d'esprit*, the *History of John Bull*, which has so often been imitated. Besides several medical essays, he published *Tables of Greek, Roman, and Jewish Measures, Weights, and Coins* (London, 1705-8), a work which was long the best authority on the subject. There is also a philosophical poem of his composition in *Dodley's Miscellanies*, entitled "Know Thyself."

**ARBUTUS**, a genus of plants of the natural order *ericææ*, containing a number of species, small trees and shrubs, the greater part of which are American. The fruit is fleshy, 5-celled, many-seeded, usually dotted with little projections, whence that of some species has a sort of resemblance to strawberries; the corolla is urn-shaped.—*A. Uredo*, the STRAWBERRY TREE, is a native of the south of Europe, found also in Asia and America, and in one locality in the British isles, the lakes of Killarney, where its fine foliage adds much to the charm of the scenery. It requires protection in winter in the climate of Paris. In Britain, it is often planted as an ornamental evergreen. It grows to the height of 20 to 30 feet but is rather a great bush than a tree. The bark is rugged; the leaves oblongo-lanceolate, smooth and shining, bluntly serrated; the flowers nodding, large, greenish white; the fruit globose, of a scarlet color, with a vapid sweetish taste. It is, however, sometimes eaten. Of late, excellent alcohol has been made from it in Italy. A wine is made from it in Corsica, which, however, is narcotic, if taken in considerable quantity, as the fruit itself is, if eaten too freely. The bark and leaves are astringent.—*A. andrachne* is also sometimes cultivated as an ornamental plant in Britain, but is impatient of severe frosts. Its fruit, and that of *A. integrifolia*, are eaten in Greece and the east. But all the species seem to possess narcotic qualities in greater or less degree; the fruit of *A. furens*, a small shrub, a native of Chili, so much as to cause delirium.—*A. aculeata*, which abounds at cape Horn and on Staten island, is an elegant and most pleasing evergreen, very much resembling the myrtle. It grows to the height of 3 or 4 feet, and produces small white flowers, followed by a profusion of red shining berries, which ornament the bush during winter. Their flavor is insipid, but somewhat astringent. Mixed with a few raisins, they have been made by voyagers into tolerable tarts. *A. uva ursi*, now generally called *arctostaphylos uva ursi*, the RED BEARBERRY, is a small trailing evergreen shrub, common in the Highlands of Scotland and in the Hebrides, and indeed in the northern parts of Europe, Siberia, and North America. It grows in dry, heathy, and rocky places. The flowers are in small crowded terminal racemes, of a beautiful rose color. The berries are austere and mealy; they are said to form a principal part of the food of bears in northern regions. Grouse also feed on them. The dried leaves are used as an astringent and tonic medicine, and as such have a place in the pharmacopœias, being principally employed in chronic affections of the bladder; but those of *vaccinium vitis idæa* are often fraudulently substituted for them.—The BLACK BEARBERRY (*A.* or *arctostaphylos alpina*) is also a native of the northern parts of the globe, a small trailing shrub, with black berries about the size of a sloe, relished by some, but having a peculiar taste, which to others is disagreeable. The plant is found on many of the Highland mountains of Scotland.

**ARBUTUS** (*ante*). The trailing *A.*, *epigæa repens*, called mayflower, and ground laurel, is found on the edges of pine forests in all parts of New England, especially near the coast, and in the valley of the Connecticut, and in Michigan, Wisconsin, and Minnesota. It is prized for its fragrant and beautiful blossom, which is one of the earliest flowers of spring.

**ARC** (Lat. *arcus*, a bow) is any part of a curved line. The straight line joining the ends of an A. is its *chord*, which is always less than the A. itself. Arcs of circles are *similar* when they subtend equal angles at the centers of their respective circles; and if similar arcs belong to equal circles, the arcs themselves are *equal*. The length of an A. is readily found if the angle which it subtends at the center of the circle is known, and also the length of the whole circumference. Let the whole circumference be 100, and the angle of an A. 50°, the length of the A. is

$$360^\circ : 50^\circ :: 100 : \frac{100 \times 50}{360} = 14 \text{ nearly.}$$

**ARC.** See JOAN OF ARC.

**ARCA**, or ARK-SHELL, a genus of bivalve shells, and lamello-branchiate mollusca, the type of a family called *arcadæ* or *arcacææ*. In the true ark-shells, the hinge is straight, and occupies what at first seems the whole length of the shell, but is in reality its whole

breadth, the breadth being greater than the length. One species is found on the British shores; the species are larger and more numerous in the seas of warmer climates, and some of them are frequently to be seen among the shells employed for the ornament of drawing-rooms, etc. Fossil *arcade* are, however, more numerous than recent species, and are found in various rock systems.

**ARCADE** (Fr.), a row of arches, supported by columns, either having an open space of greater or less width behind them, or in contact with masonry. The A. in Gothic corresponds to the colonnade in classical architecture, the difference between them being that, whereas the pillars in the colonnade support straight architraves, those in the A. support arches. The term A. is sometimes applied to the row of piers, or columns and arches, by which the aisles are divided from the nave of a church, or by which cloisters, or what are erroneously called piazzas in Britain, are inclosed; but it is more generally confined to those series of smaller arches which are employed simply for purposes of ornamentation. Arcades of the latter kind are often found surrounding the square towers of English churches. Of this we have early examples in the church of Middleton Stoney, Oxfordshire, and in the still older ones of Tewkesbury, and Christ church in Oxford. The term in also applied, improperly, to a glass-covered street or lane, with a row of shops or stalls on each side.

**ARCADIA**, the middle and highest part of Peloponnesus, was bounded on the n. by Achaia, on the e. by Argolis, on the s. by Messenia and Laconia, and on the w. by Elis. According to Pausanias, it derived its name from Arcas, the son of Callisto. Next to Laconia, A. was the largest country in the Peloponnesus. It had an area of 1700 sq.m., and was girt round by a circle of mountains, which cut off to a large extent its communication with the rest of the peninsula. Mountains also intersected it in different directions. The western part of what was anciently A., is wild, bleak, and rugged, and was at one time covered with huge forests; the eastern is more fertile, the mountains not so high, and the vales more luxuriant. In these eastern valleys lay all the principal cities of A. The loftiest peak in A.—the loftiest also in the Peloponnesus—is Mt. Cyllene, in the n.e., 778 ft. The chief river was anciently the Alpheius, (q.v.). Originally A. was named Pelasgia, after its first inhabitants, the Pelasgi. Subsequently, it was divided into several small states, which formed a confederation. Of these united states, the chief were Mantinea, Tegea, Orchomenos, Pheneus, Psophis, and Megalopolis. The inhabitants, engaged chiefly in tending cattle and in hunting among the wild highlands, remained long in a state of barbarism. After civilization had advanced, and the Arcadians had become known by their love of music and dancing, they still retained some military spirit, and were sometimes engaged as mercenary soldiers. But generally their character accorded with their simple, rural mode of life; though it seems certain that human sacrifices were offered as late as the period of the Macedonian sway. The Arcadians were not remarkable for their intelligence. In fact, an "Arcadian youth" was a synonym for a blockhead. Pan and Diana were their favorite deities. Ancient and modern poets (the latter especially in the time when "pastorals" were popular) have described A. as the land of peace, innocence, and patriarchal manners.

**ARCADIUS**, first emperor of the east (395–408 A.D.), was b. in Spain, 383 A.D., and was the son of the emperor Theodosius, after whose death the Roman empire was divided into east and west. A. lived in oriental state and splendor, and his dominion extended from the Adriatic sea to the river Tigris, and from Scythia to Ethiopia; but the real rulers over this vast empire were, first, the Gaul Rufinus, and afterwards the eunuch Eutropius, who openly assumed the reins of government and the command of the army, while A. reposed in luxurious indifference. In 399, the eunuch Eutropius was deposed by another usurper, Gainas, who, in his turn, soon fell a victim to his own ambition. Afterwards, Eudoxia, the wife of the emperor, assumed the supremacy. One really great man adorned this period, the virtuous and eloquent Chrysostom, who was persecuted by Eudoxia, and through her influence exiled in 404, on account of his firm opposition to Arianism, which the empress herself favored. During the reign of A., his territories suffered by barbarian incursions, earthquakes, and famine, but nothing could disturb the indifference of the monarch. He d., unlamented, 408 A.D.

**ARCA'NI DISCIPLINA** (system of secret instruction). See *MYSTAGOGUE*, *ante*.

**ARCE'** (anc. *Arx*), a t. of south Italy, in the province of Caserta, 60 m. e.s.e. from Rome. It is situated on a hill near the Liris; and the summit of the hill, which is lofty and precipitous, is crowned by an interesting mediæval fortress called *Rocca d'Arce*. This fortress was considered impregnable till it was scaled and taken by the invading army of Charles of Anjou in 1266. Numerous inscriptions in which the name of Cicero occurs have been discovered near A.; and some ruins near the town are known as *L'aja di Cicerone*, or Cicero's barn. Pop. of commune, 5467.

**ARCESILA'US**, a Greek philosopher, founder of the new academy, was b. at Pitane in Æolia, Asia Minor, 316 B.C. He studied philosophy, first under Theophrastus the peripatetic, and afterwards under Crantor. After the death of Crantor, A. became the chief master of the academic party, or those who held to the doctrines of Plato; but he introduced so many changes that its philosophic character was completely changed. His great rivals were the Stoics, whose opinions he attacked, but he does not appear to have attained any certainty in his own convictions. He had studied under too many

masters, and discussed too many different systems, to be sure of the truth of any. He denied the Stoical doctrine of a "convincing conception," which he affirmed to be, from its very nature, unintelligible and contradictory. He also denied the existence of any sufficient criterion of truth, and recommended abstinence from all dogmatic judgments. In practice he maintained that we must act on grounds of probability. It is not easy to determine satisfactorily what his moral character was. A wit, a poet, and a man of frank and generous disposition, which seems to have captivated his disciples even more than his philosophy, he has yet been accused by his enemies of the grossest profligacy; and whatever extravagance there may be in such an extreme charge, it is tolerably certain that he died of a debauch in his 76th year (241 B.C.). Nevertheless, his adversary Cleanthes, the Stoic, passed this high eulogium on him: "The morality which A. abolishes in his words, he re-establishes in his actions."

**ARCH**, an arrangement of bricks, stones, or other materials over an open space, by which they are made not only to support each other by mutual pressure, but to sustain a superincumbent weight. We have the excellent authority of sir G. Wilkinson for stating that the A. was known to, and used by, the ancient Egyptians; and that the Assyrians were acquainted with its principles is placed beyond doubt by the arched gateways so frequently represented in their bas-reliefs. The A. is generally supposed to have been unknown to the Greeks—a supposition which becomes very improbable if we hold it to be proved that it was used by nations with whose works they must have been familiar. But that the Greeks did not employ it generally in their architectural structures is certain; and as it is not less certain that the Romans did, it is to the latter people that the nations of modern Europe are indebted for their acquaintance with its great utility. The introduction of the A. by the Romans gradually effected a complete revolution in the architectural forms which they borrowed from the Greeks. The predominance of horizontal lines gave way by degrees, till, as the Romanesque passed into the Gothic style, it was superseded by the segments of a circle, placed generally more or less in a perpendicular direction. In its earliest application by the Romans, the A. did not spring from the entablature of the columns, but was generally placed behind them, and rested upon separate imposts. Subsequently, this arrangement was departed from, and the A. assumed the position which it has since retained above the columns; sometimes having an entablature interposed, and sometimes rising directly from the capital of the column or pier, as in the Romanesque. Before mentioning very briefly the different forms of the A., it seems natural to refer to a very simple structure, frequently met with in those early edifices in our own country which we are in the habit of designating as Saxon. It consists of two stones, their lower ends resting on rude piers, their tops leaning against each other, and thus forming two sides of a triangle, which is capable of supporting a moderate superincumbent weight. The mechanical principles on which the A. depends, though here very imperfectly employed, seem sufficiently called into play to suggest their more extensive application; and it is not impossible that out of this rude construction the A., in its later and more elaborate forms, might have developed itself amongst ourselves without hints from foreign sources.

Of the A. itself, the following variations of form may be enumerated: The semi-circle, the segment, the ellipse, which were the only forms employed by the ancients, and which alone were known in mediæval architecture up to the time at which the pointed A. was introduced. Of these, the stilted A. and the horseshoe A. are modifications, in both of which the center or point from which the A. is described is above the line of the impost, but in the former of which the moldings are continued downwards vertically; whilst in the latter they are slightly inclined inwards, or the curve is prolonged till it meets the impost. The horseshoe A. belongs peculiarly to Arabian architecture (q.v.), not only from its having originated simultaneously with the faith of the prophet, but from its continuing to be used exclusively by his followers. Next, in point of time, though far surpassing all the others in beauty and variety, is the pointed A., the origin of which is still a subject of antiquarian controversy. The greater or less acuteness of the pointed A. depends on the position of the two center points from which its curved sides are described.

Of the foil arches or arches in which the forms of a leaf are imitated may be mentioned the trefoil, the cinquefoil, and the polyfoil, the latter being met with in Arabian and Romanesque buildings. At a later period of Gothic architecture, with the decorated style, the ogee A. was introduced, and the Tudor or four-cornered A. appeared about the commencement of the perpendicular style. When first introduced, the proportions of this A. were bold and effective; but it was gradually depressed till the principle of the A. was lost, and its very form was again merged first in two and then in one flat stone or lintel over an opening. With the last form of the Tudor A. we thus reach almost the point of departure in the construction of the A., and complete our enumeration of its forms.

The sides of an A. are termed *haunches* or *flanks*, and its highest part is called the *crown*. The wedge-shaped stones, bricks, or other materials of which an A. is con-

structed are called *voussoirs* (*a, a, a*); the uppermost one of all (*b*) is called the *keystone*; the lowest, which is placed immediately over the impost, the *springer*, or springing-stone; the under or lower side of the voussoirs, the *intrados*; the upper side, the *extrados* or *back*. For the investigation of the mechanical principle of the A., and of the conditions of stability, see Moseley's *Mechanical Principles of Engineering and Architecture*. See also BRIDGE, IMPOST, PIER, BUTTRESS.

**ARCH, TRIUMPHAL**, was a structure erected by the Romans across roads, or at the entrance of cities, in honor of victorious generals. The original triumphal arch was the Porta Triumphalis, one of the gates of Rome through which the triumphal procession entered the city. Among the earliest detached arches built at Rome was that built by Scipio Africanus (190 B.C.) on the Capitoline hill. Under the emperors, these structures became numerous and magnificent, and were decorated with bas-reliefs and inscriptions. Three of what were properly triumphal arches still remain in Rome, those, namely, of Titus, Septimius Severus, and Constantine. Numerous similar monuments exist also in other parts of the old Roman empire, as at Rimini, Susa, Verona, Ancona, Orange (in France), Capura (in Spain).

**ARCH, JOSEPH**, an English agriculturist, b. 1828. His parents were in humble circumstances, and he educated himself; at an early age he became an advocate of temperance and a Methodist local preacher. He rebelled against the low price paid for farm-labor, and after much struggle and suffering became a leader in efforts to better the condition of laboring men. In 1872, the national agricultural laborers' union was formed, and A. became its president. In 1873, he visited Canada and the United States to study the condition and prospects of labor, and the question of emigration.

**ARCHÆAN**, or **AZOIC, PERIOD**—from the Greek for beginning—commencing with the earliest formation of the earth's crust, is the period to which are assigned the oldest rocks on which those of late ages have been spread, and from which most of them have been made. The archæan rocks, extending round the globe, are in most places shut out from sight by the later formations, yet in various parts of both hemispheres, rising above the rest, they are exposed to view as surface rocks. In Europe they are visible in the n.w. of Scotland, in the iron regions of Norway and Sweden, in the n.w. and n.e. of Russia, down to the White sea, in the Ural mountains, and further s. in Podolia. In central Europe they appear in the midst of the more recent formations, protrude frequently in the Carpathian mountains and central crests of the Alps, and in Bavaria and Bohemia between the Danube and the Elbe. In North America they rise to the surface in a large district between the Arctic circle and the great lakes, in a tract s. of lake Superior and another in southern New York, in the Highlands, and in the central part of the Appalachian chain and Rocky mountains. In Canada, where they have been carefully studied, they are believed to be more than 30,000 ft. thick; in Europe their exact thickness can scarcely be conjectured, yet it must be many thousand feet. These rocks are chiefly crystalline, such as granite, syenite, gneiss, syenitic gneiss, mica-schist, hornblende schist, chlorite slate, and granular limestone. There are also some hard conglomerates, quartz rocks, and slates. They very often contain iron-bearing minerals, and immense beds of iron ore are found with them in northern New York—where they are from 100 to 200 ft. thick—New Jersey, Michigan, and south of lake Superior. Graphite also is found abundantly throughout the archæan rocks of Canada and the adjacent parts of the United States. In the archæan rocks indications of life are almost if not entirely wanting. For this reason the period is named also the *azoic*, lifeless. But in the limestones of Canada a form has been discovered which is thought by eminent geologists to be a coral-like fossil made by protozoans of the class of rhizopods, the simplest kind of animal life. Its organic nature has not indeed been placed beyond doubt; still geologists think it probable that rhizopods existed in the waters before the close of the archæan period, and that the beds of limestone have been made up of their minute shells. The abundance of graphite found throughout the archæan rocks of Canada and the United States is also regarded as an indication that organic plants then existed, as it is known that in late times graphite has been formed out of such remains. For these reasons the name *ozoic*—the dawn of life—has been proposed for the later portion of the archæan period.

**ARCHÆOLOGY** (Gr. *archaios*, ancient, and *logos*, a discourse) is the name now very generally given to the study which was formerly known as that of "antiquities." The term is well enough understood, although its meaning is not at all definitely fixed. In its widest sense, it includes the knowledge of the origin, language, religion, laws, institutions, literature, science, arts, manners, customs—everything, in a word, that can be learned of the ancient life and being of a people. When so used, it comprehends more or less of several branches of knowledge which are recognized as distinct or independent pursuits, such, for example, as ethnology, philology, history, chronology, biography, mythology, numismatics. In its narrower but perhaps more popular signification, A. is understood to mean the discovery, preservation, collection, arrangement, authentication, publication, description, interpretation, or elucidation of the materials from which a knowledge of the ancient condition of a country is to be attained. These materials will be found to divide themselves into three great classes: (1.) written, (2.) monumental, and (3.) traditional. 1. What may be called written A., may be again subdivided into

palæography (q.v.), or diplomatics (q.v.)—that is, the science of ancient writings; and bibliography (q.v.), or the knowledge of printed books. 2. Monumental A. admits of almost endless subdivisions, according to the character of the remains to be studied, which may be works of art, such as buildings, sculptures, paintings, engravings, inscriptions, coins, medals, seals, armorial-bearings, tapestry, furniture, plate, jewels, enamels, glass, porcelain, pottery; works of engineering, such as roads, canals, mines, piers, camps, forts, walls; works of unskilled labor, such as pillars of unhewn stone, caves, dikes, ditches, mounds of earth or stone; articles of dress, armor, or personal ornament; tools, weapons, implements, utensils, machines; appliances for locomotion, such as canoes, boats, ships, carriages; modes of sepulture, such as mummies, sarcophagi, urns, catacombs, graves; vestiges of man and animals, such as skulls, bones, skins. 3. Traditional A. includes as well the unwritten language and oral literature of a people, their dialects, legends, tales, proverbs, rhymes, songs, and ballads, as those sports, customs, ceremonies, rites, and superstitions now beginning to be known by the name of "folklore," and formerly called "popular antiquities."

The study of A. in modern Europe may be held to date from the revival of letters. It was long almost exclusively confined to the antiquities of the Greeks and Romans. About the middle of the 16th c., mediæval A., or the antiquities of the dark and middle ages, began to be cultivated. Egyptian A., or "Egyptology," as it is sometimes called, made comparatively little progress until the discovery of the Rosetta stone, containing a bilingual and trilingual inscription, which enabled Young in 1819, and Champollion in 1821, to find a key to the hieroglyphics. The more recent discoveries of Botta, Layard, Rawlinson, and others, have already advanced Assyrian A. to a point beyond all expectation. Indian A. has been successfully prosecuted, especially during the last forty years, chiefly by officers of the East India company. Something also has been done by them and others for Chinese A. Men of letters in the United States have devoted their time to the rude and scanty remains of the aboriginal inhabitants of North America. The A. of Central and South America, as it attracted attention much earlier, so its more stately and instructive monuments have much better rewarded such investigations as those of lord Kingsborough, Messrs. Stephens and Catterwood, and others.

The study of A. has been largely promoted by the publication, at the expense of the state, in various countries, of the nation chronicles, charters, and records; by societies and clubs contributing to the same end, or printing essays on questions of A.; and by the establishment by the state, by associations, or by individuals, of museums for the collection and classification of antiquities. In England, a society for promoting the study of antiquity was founded so early as the year 1572. The irrational jealousy of the government dissolved it in 1604. It was revived in 1707, enlarged in 1717, and incorporated by royal charter in 1751, under the name of the "society of antiquaries of London." An attempt to institute a similar society in Scotland was made about 1700 by "some honorable and knowing gentlemen," who resolved to continue their conferences till a complete historical account be made of the nation. But it was not until 1780 that the society of antiquaries of Scotland was incorporated by royal charter. The royal Irish academy for promoting "the study of science, polite literature, and antiquities," was chartered in 1786. The society of antiquaries of Scotland, and the royal Irish academy, have good museums of national antiquities. The British museum in London (established in 1753), besides a great collection of early manuscripts and printed books, has galleries of Assyrian, Egyptian, Etruscan, Greek, Roman, British, and mediæval antiquities. One of the most remarkable collections of antiquities on the continent is that of the royal society of antiquaries of the north, at Copenhagen, arranged so as to illustrate a favorite theory of the Scandinavian archæologists—that the primitive antiquities of a country may be assigned to three successive ages or periods of stone, bronze, and iron, with as much certainty and precision as the comparative antiquity of geological strata, or periods of the world's creation, may be determined by the fossils which they are found to contain. The museums of the Louvre and the Hôtel de Clugny, in Paris, contain fine collections of Assyrian, Egyptian, Greek, and Roman antiquities, and an unrivaled collection of mediæval antiquities. The royal museum at Naples has gathered together the statues, paintings, vases, household utensils, and other objects recovered during the last hundred years from the ruins of Herculaneum and Pompeii. These long buried cities may be regarded as being in themselves museums of Roman A.

ARCHÆOL'OGY (*ante*), has recently gained new and world-wide interest through the indefatigable labors and rich discoveries of count and gen. Luigi Palma di Cesnola, and Dr. Heinrich Schliemann, the first a native of Italy, but an American citizen, and the last a native and a citizen of Germany. At the close of the civil war in the United States, in which gen. di Cesnola served with distinction, he was sent as American consul to Cyprus. He was at once inspired with the idea that the famous island was the door between Asia and Europe, and must be full of relics of the nations which traversed and ruled it three thousand years ago. This was in 1865, and he very soon devoted his whole attention to archæological investigations. He began excavations at Kitium (the Chittim of the Old Testament), over the buried streets of which there is now the town of Larnaca. Within a year he found the sites of three other old cities, Salamis, Golgos, and Idalium. At Kitium he found that the graves had been plundered, most likely in the time of the

early crusades; but he discovered the remains of a temple dedicated to Demeter Paralia, and next to it, in a tomb, a jar with 600 gold coins of the great Alexander and his father, Philip of Macedon. He also found remains of a Phœnician temple, older than that of Demeter, a marble sarcophagus with a Phœnician head in high relief, and two vases of alabaster. The Greek tombs, more than 2000 of which he opened, contained lamps, bronze mirrors, glass vessels, and other funereal decorations. At Idalium, under the modern town of Dali, 15,000 tombs were opened, the greater part Phœnician, in which were myriads of the oldest terra-cotta vases of all shapes and sizes, and some Greek vases containing iridescent glass. At Salamis he found nothing of consequence; that city was doubtless despoiled of its art-treasures at an early period. In the ruins of Leucolla he found the remains of a temple with statues, and near it a rock cavern accessible only from the sea, in which was an immense quantity of human bones in a state of petrification. At Golgos he found most of the rich store exhibited by him in London in 1872, which the British museum sought to secure, but which New York acquired. In the course of further exploration he found the sites of nearly a dozen cities and towns, Actæon, Amathus, Aphrodisium, Arsinoë, Karpassia, Lapethus, Neo-Paphos, Palæo-Paphos, Soli, Throni, and Visuri. Then came his great triumph, at Kurium, where in the treasure-chambers of an unknown temple he found the most wonderful deposits of gold and silver diadems, bracelets, rings of all kinds, armlets, etc., votive offerings of the finest workmanship, among them some of the finest gem-engraving and delicate metal work ever discovered. The extent of his discovery may be judged from the fact that from one treasure-chamber, or series of vaults, he took more than 1200 objects, about half of them of gold. Some of the more interesting articles, in a historical view, are: the official seal of Thotmes III., a king of Egypt who conquered Cyprus about 3300 years ago; Babylonian cylinders, or records on fine stone, which Rawlinson and Sayce refer to dates 2700, 3100, and 3500 years ago; a gold armlet of a king of Paphos of six or seven centuries B.C., and others of less clearly defined ancient dates. Rings in the form of asps, some retaining their stone settings or remains of enamel; gold clasps and pendants, beautifully incrusting by a granulating process, and diadems of gold, clasped around the foreheads of skulls, are among the treasures. There is a calyx of gold, nearly six inches in diameter, with circular engraved bands on which are traced stags, hunters, palm trees, and water, in the Egyptian style, an article of remarkable beauty in perfect preservation; there are also numerous articles of silver and bronze of rare interest. But the most valuable portion of the treasure is the large collection of engraved stones. Carnelian, agate, onyx, jasper, chalcedony, and other hard and fine grained stones, were used by the ancient engravers. One specimen, "Boreas carrying off Zephyr," is a masterpiece of genius; the "Rape of Proserpine" is also very fine. These are in miniature, less than an inch in diameter. Intaglios are in the collection in hard stone, representing Egyptian gods, priests, and worship. There are carvings in alabaster, and others of terra cotta. The objects in bronze, more than 500 in number, are lamps, mirrors, stands, vases, and heads of animals. This wonderful collection, but a portion of which can be here indicated, was purchased for the city of New York, and may be found in the museum of natural history and art, Central park.

Dr. Schliemann's earliest researches were where he believed would be found Homer's city of Troy, but it is at least an open question whether the ruins he discovered were of the famous old place, whose existence has been thought scarcely more than legendary, though he was confident that he had identified the temple of Athene. His late operations were upon old Mycenæ, the capital of Argolis, and Agamemnon's home. He found the ruins of the acropolis, which the people of the vicinage to-day call Agamemnon fort, the pavements of which show the wear of chariot wheels, and the walls the application of bolts and hinges. What the present natives call the tomb of Agamemnon, he found to be the treasury of Atreus, cut into the side of a hill and facing a deep ravine. The interior is in two compartments, the first shaped like a cave, 50 ft. wide and 50 ft. high, and the other square, 21 ft. each way. The walls are of hewn stone, without cement, and were once faced with polished metal. A number of tomb slabs, found near but outside of the acropolis, are believed to mark the burial-places of Agamemnon and his companions. A great number of tombs were opened, but few remains of bodies found. In one place, however, he found a vault 21 ft. long, 14½ deep, and nearly 12 wide, in which there were human remains. One of the dead bodies had been covered with five thin plates of gold, from 18½ to 25 inches long and 2½ wide, upon which were crosses and gold foil. There were also gold blades, vases, fragments of porphyry, and other sculptures. But the most important discovery was that of a subterranean treasury, dome-shaped, with an entrance 13 ft. long, and a roof of stone slabs over three yards long, supposed to have been a royal treasure-chamber, and covered at a very early period. Here were rude idols of Hera, or Juno, and other female gods; male idols of Assyrian type; idols in the form of a cow, sacred to Juno; an idol with a bird's head; female forms with the heads of cows, the latter on the handles of vases. There were bronze lances, hatchets, knives, hair-pins, vases, and a tripod. Vases were found in large numbers and great variety of painting. There were large goblets with one and two handles; fragments of a white marble frieze, with spiral ornaments, and part of a necklace, with beads strung on copper wire. In other places he found more idols, copper and iron-headed arrows, a wooden fish, a scepter-head of green stone carved into an Egyptian

face, knives and arrows of obsidian, and a glass dish having impressed in it the image of a fly. Still further search disclosed an immense cyclopean house, thought to have been a royal palace. Here he found an onyx finger-ring with figures of hornless cows in intaglio; neck beads; a jasper mold for gold and silver ornaments, having patterns or dies on each of its six sides; axes of green stone and jasper; paintings of warriors in red on a yellow ground, the figures being of an Asiatic type. There were also vases, with handles in the form of crocodiles, a large dragon tripod, and other vessels of brass. Dr. S. has presented this entire collection to the government of Greece. Archæological researches are in progress at Rome, Pompeii, and in other places.

**ARCHÆOPTERYX**, a fossil bird, long tailed and of reptilian nature, found in the jurassic limestone of Bavaria. As near as can be judged from the few specimens, the A. appears to have been in some sort a link between reptiles and birds. Its wings were short, but had long plumes, which spread like a fan, its tail was vertebrate, and feathers grew out from either side.

**ARCHANGEL** (from the Greek prefix *archi-* or *arch-*, denoting chief, and *angelos*, an angel), a term which occurs in the New Testament; and which, according to some, is there a title of our Savior—but according to others, designates an angel superior in power and glory to the other angels. We read, in the epistle of Jude, of "Michael the A.," and in Rev. xii. 7, of "Michael and his angels." In 1 Thess. iv. 16, we are told that the coming of our Lord at the last day shall be "with the voice of the A., and with the trump of God." We nowhere read in the Holy Scriptures of *archangels*, although the plural is popularly as much used as the singular. The notion of an angelic hierarchy certainly prevailed among the Jews, the highest place being assigned to Michael; and the same notion has extensively prevailed in the Christian church. There are passages of Scripture which seem to indicate different degrees and classes among the angelic hosts, but no clear revelation has been made upon this subject. See **ANGELS**.

**ARCHANGEL**, the chief city in the Russian department of Archangel, is situated in lat. 64° 32' n., and long. 40° 33' e., about 40 m. above the junction of the river Dwina with the White sea; is the seat of an archbishop, and contains (1867) 19,936 inhabitants. Its name is taken from the monastery of St. Michael. A. is the chief commercial city for the north of Russia and Siberia, and is visited by numerous vessels—especially British—from July to September, the port being clear of ice only during that period. The houses are built chiefly of wood; and their general appearance is far from handsome. The finest edifices are the bazaar or mart, and the marine hospital. A. has an ecclesiastical college with 9 professors, schools for engineering and navigation, etc. The chief articles of traffic are fish, train-oil, skins, furs, timber, wax, iron, tallow, bristles, caviare. The total value of exports in 1874 was £12,343,900. The t., which is the oldest seaport of the empire, and was for a long period the only one, was founded in 1584. Its merchants trade as far e. as China, and have all the commerce of Siberia. During summer, A. has a continual market.

**ARCHANGEL**, or **ARKANGELSKOE**, a government and city of Russia; the government between 61° and 71° n., and 29° to 68° e., along the White sea and Arctic ocean, and including the island of Nova Zembla; 286,739 sq.m.; pop. '67, 275,779. The n. part is sterile, and its winters are severe. Below the arctic circle are extensive forests, lakes, and morasses. The spring is moist, with cold frosty nights; summer has long, foggy days, and the autumn is short and moist. The wealth of A. is in its forests. Gold, naphtha, salt, coal or lignite, and sulphur springs are found. The productions are pitch, tar, tallow, turpentine, potash, cordage, mats, and leather.

**ARCHANGEL**, New. See **SITKA**.

**ARCHBISHOP** (Gr. *arch-*, and *episcopos*, overseer) is the title given to a metropolitan bishop who superintends the conduct of the suffragan bishops in his province, and also exercises episcopal authority in his own diocese. The title arose, in the 3d and 4th centuries, from the provincial synods being held once or twice a year in the chief t. of the province under the presidency of the bishop of the place. Another cause of the origin of the title is said to be the custom of planting new bishoprics as Christianity spread, a slight supremacy being still retained by the original over the newly-appointed chief pastors. In the oriental church, the archbishops are still called "metropolitans," from the circumstance first mentioned. In the African church, on the other hand, the term used was "primus." The great archbishoprics of the early church were those of Jerusalem, Antioch, Ephesus, Alexandria, Constantinople, and Rome. Since the 6th c., the A. of Rome has assumed the name of pope (papa). There is an official letter by Justinian, addressed to "John A. of Rome and patriarch;" and several ecclesiastical constitutions are addressed to "Epiphanius A. of Constantinople and patriarch." The synod of Antioch, in 341, assigned to the A. the superintendence over all the bishoprics, and a precedence in rank over all the bishops of the church, who, on important matters, were bound to consult him and be guided by his advice. By degrees there arose, out of this superiority of rank, privileges which at length assumed the character of positive jurisdiction in ecclesiastical matters. Many of these rights passed to the patriarchs (q.v.) towards the end of the 4th and during the 5th centuries, and still more to the pope in the 9th. The archbishops still retained jurisdiction, in the first instance, over their

suffragans in matters which were not criminal, and over those who were subject to them they acted as a court of appeal. They possessed also the right of calling together, and presiding in, the provincial synods; the superintendence and power of visitation over the bishops of the metropolitan see; the power of enforcing the laws of the church; the dispensation of indulgences, and the like. The archbishops further enjoyed the honor of having the cross carried before them in their own archiepiscopate, even in presence of the pope himself, and of wearing the *pallium*. In England, there are two A., of whom the one has his seat at Canterbury, the capital of the ancient kingdom of Kent; the other at York, the capital of Northumbria. But though, as ruling over a province in place of a single diocese, both have enjoyed the rank of metropolitans from the first, the A. of Canterbury has all along enjoyed, not merely precedence as the successor of Augustine and the senior A., but as possessing a pre-eminent and universal authority over the whole kingdom. This pre-eminence is marked in the titles which they respectively assume—the A. of Canterbury being styled the primate of all England (*metropolitanus et primus totius Angliæ*), whilst the A. of York is simply called primate of England (*primus et metropolitanus Angliæ*). It is also indicated by the places which they occupy in processions—the A. of Canterbury, who has precedence of all the nobility, not only preceding the A. of York, but the lord chancellor being interposed between them. Previous to the creation of an archbishopric in Ireland, the authority of the A. of Canterbury extended to that island. The amount of control which belongs to an A. over the bishops of his province is not very accurately defined; but if any bishop introduces irregularities into his diocese, or is guilty of immorality, the A. may call him to account, and even deprive him. In 1822, the A. of Armagh, who is primate of all Ireland, deposed the bishop of Clogher on the latter ground. To the A. of Canterbury belongs the honor of placing the crown on the sovereign's head at his coronation; and the A. of York claims the like privilege in the case of the queen-consort, whose perpetual chaplain he is. The province of the A. of York consists of the six northern counties, with Cheshire and Nottinghamshire. The rest of England and Wales form the province of the A. of Canterbury. The dioceses of the two A.—that is to say, the districts in which they exercise ordinary episcopal functions—were remodeled by 6 and 7 Will. IV. c. 77. The diocese of Canterbury comprises Kent, except the city and deanery of Rochester, and some parishes transferred by this act; a number of parishes in Sussex called "peculiars;" with small districts in other dioceses, particularly London. The diocese of the A. of York embraces the co. of York, except that portion of it now included in the dioceses of Ripon and Manchester; the whole co. of Nottingham; and some other detached districts.

In Ireland there are two Protestant and four Roman Catholic archbishops. Of the former, the A. of Armagh is primate of all Ireland; the A. of Dublin being primate of Ireland. They formerly sat alternately in the house of lords; the three bishops who, along with them, represented the church of Ireland, being chosen by rotation. The election of an A. does not differ from that of a bishop (see BISHOP), but when he is invested with his office, he is said to be "enthroned," whereas a bishop is "consecrated." He also writes himself, "by divine providence;" a bishop being, "by divine permission;" and has the title of "grace," and "most reverend father in God," whilst a bishop is styled "lord," and "right reverend father in God." The A. is entitled to present to all ecclesiastical livings in the disposal of diocesan bishops, if not filled up within six months; and every bishop, whether created or translated, was formerly bound to make a legal conveyance to the A. of the next avoidance of one such dignity or benefice belonging to his see as the A. shall choose.

**ARCHDEACON** (Gr. *arch*-, and *diaconos*, servant). An ecclesiastical dignitary whose jurisdiction is immediately subordinate to that of the bishop. The A. originally was simply the chief of the deacons, who were the attendants and assistants of the bishop in church affairs. His duties consisted in attending the bishop at the altar and at ordinations, assisting him in managing the revenues of the church, and directing the deacons in their duties. From being thus mere assistants, archdeacons in the 5th c. began to share the bishop's powers, and step by step attained to the authority which they now enjoy, which from the 9th c. became in many respects distinct from that of the bishop. Several synods protested against the innovation, but it was continued in the 11th and 12th centuries, when the archdeacons were recognized as the most influential of prelates. In the 13th c., their powers were limited by the establishment of episcopal courts. Their dignity and influence is now very much reduced in the Catholic church. There were formerly 60 archdeaconries in England, but their number has been considerably increased since the passing of the act for carrying into effect the report of the ecclesiastical commissioners (6 and 7 Will. IV. c. 77); and it is probable that under the provisions of that act they may be still further increased. No person can be appointed an A. till he has been six years complete in priest's orders (3 and 4 Vict. c. 113, s. 27). The duty of parochial visitation has long been regarded as belonging specially to the archidiaconal office, and it was by its exercise mainly that the archdeacons attained to the dignity of ordinary instead of delegated jurisdiction. Even in performing this function, however, and in holding general synods or visitations, ordering repairs of churches, and the like, the A. is properly to be regarded as being what the canon law called him, "the bishop's eye."

The judge of the A.'s court, when he does not preside, is called "the official." There is an appeal to the court of the bishop, or in the case of an A. of an archbishopric, to the court of arches. See DEACON, DEAN, PRIEST. See also Cripps's *Law Relating to the Church and Clergy*. Edinburgh, 1857.

**ARCHDUKE.** A. and archduchess are titles now taken by all the sons and daughters of the emperor of Austria, and by their descendants through the male line. The title of A. was gradually assumed by the dukes of Austria, as a mark of precedence over the other dukes of the empire. Duke Rudolph IV. of Austria, in 1359, called himself Palatinus Archidux, but he was not so styled by the emperor. His brothers, Albert and Leopold, did not assume the title after his death, though they had occasionally done so in his lifetime. The third son of Leopold, however, Ernest-the-Iron, revived it. Still he was addressed by the emperor simply as duke. At last the title was formally conferred on them by the emperor Frederick III. in 1453, who himself, as duke, was the first recipient of the imperial gift. Still the usage was not uniform, for he afterwards speaks of himself as duke. The privilege was extended to the Tyrolian branch of the Austrian house in the person of Sigismund. The value of the dignity thus assumed was a cause of contention with Bavaria in 1589. The Austrian view was that to duke it held the same relation that archbishop does to bishop. The dukes of Austria claimed to have always had precedence over the other ducal houses, and regarded the title as a mere indication of what had been universally acknowledged. Bavaria, on the other hand, relied on the greater antiquity of its dukedom. The contest was decided by the emperor Rudolph II. in favor of Austria, the precedence of which has not since been called in question. Other dukedoms claimed the privilege of being so called, but it was invariably denied by the emperor.

**ARCHEGOSAU'RUS**, a remarkable fossil saurian reptile, so named by Goldfuss (*archēgos*, leader; and *sauros*, lizard) as constituting the real beginning of reptilian life, which had previously been considered as not extending below the permian series of rocks.

The skull is flattened and triangular, with rounded angles, the front one being somewhat lengthened. The teeth are simple cones, having a labyrinthic structure similar to that of the recent *lepidosteus*. The vertebral column remains in an embryonic condition; the arches and peripheral elements of the vertebrae are ossified; but the *chorda dorsalis*, which is persistent, is unprotected below. The ribs are short and almost straight, round and slender in the middle, expanded and flattened at the ends. The two pairs of limbs are nearly equal in size, and in structure very much resemble those of the *proteus*. They have each four long, slender digits, which obviously supported a longish, narrow-pointed paddle, adapted for swimming. Externally, the body was protected by a covering of oblong quadrangular scales, which have been preserved in some specimens.

Four species have been described.

The history of the A. is shortly this: Its remains, found in the Bavarian coal-measures, had been described as those of a fish under the name of *pygopterus lucius* (Agassiz). In 1844, H. von Meyer first described it under the name of *apateon pedestris*. This specimen was found in the coal-measures of Münster-Appel, in Rhenish Bavaria, and was supposed by Meyer to be related to the salamanders, and yet not without considerable doubt; for he says, "its head might be that of a fish, as well as that of a lizard, or of a batrachian." In 1847, Goldfuss figured and described three distinct species discovered in large concretionary nodules of clay-ironstone, from the coal-field of Saarbrück, giving to them the generic name of A. He considered them to be a transition state between the fish-like batrachia and the lizards and crocodiles. Prof. Owen has subsequently described this fossil; he makes it a remarkable connecting link between the reptile and the fish, and on these grounds: It is related to the salamandroid-ganoid fishes by the conformity of pattern in the plates of the external cranial skeleton, and by the persistence of the *chorda dorsalis*, as in the sturgeon, while it is allied to the reptiles by the persistence of the *chorda dorsalis*, and the branchial arches, and by the absence of the occipital condyle, or condyles, as in *lepidostiren*, and by the presence of labyrinthic teeth, as in *labyrinthodon*, which, however, also ally it to the ganoid *lepidosteus*. There is thus in the A. a blending together of the characteristics of reptile and fish in one animal. It occupies a position between, and equally related to, the salamandroid-ganoid fishes on the one hand, and the labyrinthodont reptiles on the other, while the latter conduct us through the *lepidostiren* to the perennibranchiate batrachia.

**ARCHELA'US**, one of the Heraclidae, who, when driven by his brothers from his native land, fled to Macedon, where he became the founder of a powerful family, of which Alexander the great was said to be a descendant.—**ARCHELAUS**, natural son of the Macedonian king, Perdiccas II., came to the throne (after he had murdered the rightful heir) in 413 B.C. His reign was far better than its commencement, as he introduced several salutary measures, and was a generous patron of art and literature. Euripides and Zeuxis frequented his court; and the palace of the monarch was splendidly adorned by the paintings of the latter. It is said that Socrates refused an invitation to proceed thither, having no great respect for the character of A., which was stained by odious vices. He is believed to have been murdered by Craterus, one of his favorites; but the story of his death is told differently.—A., a general under Mithridates the great, was sent into Greece

with a large fleet and an army of 120,000 men to oppose the Romans in 87 B.C. Sulla was sent against him, and besieged him in Piræus, whence A. moved to Bœotia, and here collected all his forces. A battle took place at Charoneia, when victory declared for the Romans. A. now retreated to Chalcis, where he waited until Mithridates had dispatched another army of 80,000 men into Greece. The second fight took place at Orchomenos, in Bœotia, and, after two days' contest, the whole host led by A. was totally routed by Sulla. A., after hiding for three days in a morass, escaped to Chalcis. After a treaty of peace had been effected between Sulla and Mithridates, A. fell under the displeasure of his monarch, being unjustly suspected of treason, and, fearing for his life, as also perhaps disgusted at the return he had received for his many services, he went over to the Romans at the outbreak of the second war, in 81 B.C. After this time he appears no more in history.—A., son of the former, married Berenice, daughter of king Ptolemæus Auletes (56 B.C.), and ruled over Egypt for the short space of six months during the banishment of Ptolemæus. The usurper lost his life in a battle against Aulus Gabinius, proconsul of Syria. His grandson, also named A., obtained from Marcus Antonius the province of Cappadocia, and retained it during the reign of Augustus. Tiberius accused him of political innovations, and condemned him to death; but, as he was old and fatuous, his life was spared. He died soon after his trial, at Rome, in 17 A.D.—A., son of Herod, the tyrant at Judea, succeeded his father in 1 A.D., and maintained his position against an insurrection raised by the Pharisees. His heirship to the throne being disputed by his brother Antipas, A. went to Rome, where his authority was confirmed by Augustus, who made him Ethnarch of Judea, Samaria, and Idumæa. After a reign of nine years, he was deposed by Augustus, on account of his cruel tyranny, and banished to Vienna, in Gaul, where he died. His territories were added to the Roman province of Syria.

ARCHELA'US, surnamed PHRYCUS, a Greek philosopher, pupil of Anaxagoras, about 450 B.C. Nothing of his writing remains, but his leading ideas were like those of his tutor. He admitted a primitive matter, consisting of infinite particles similar in nature to the bodies formed from them. He also admitted a ruling mind. He thought matter was mingled with mind, and identified the primitive matter with air; thus his first principle was air endowed with mind. Out of this air, by processes of thickening and thinning, arose cold and heat, or water and fire, the first passive, the last active. From the action of fire and water were formed the atmosphere, and the mud out of which the heavenly bodies were developed. Living organized beings, at first of low type, sprang from the mud, and gradually the races of animals were formed. Man he held to be superior to other beings by reason of his artistic and moral powers.

ARCHELA'US, a sculptor, celebrated for his bass-relief representing the apotheosis of Homer, which is supposed to have been made in the 1st c. of the Christian era. It was purchased in 1819 for the British museum.

ARCHENHOLZ, JOHANN WILHELM, Baron von, a German author, b. Sept. 3, 1745, d. Feb. 28, 1812. After service in the army, he gained his discharge at the close of the seven years' war, and passed several years in travel, visiting almost all the principal cities of Europe, and supporting himself by authorship, and, as it was generally reported, also by gambling. He wrote a *History of the Seven Years' War* (2 vols., Berlin, 1793), which, when compared with the generally dry style of his German contemporaries, deserves praise on account of its narrative interest. He also wrote *England and Italy* (2d edition, Leip., 1787), *Annals of British History* (1789-98), and biographies of queen Elizabeth of England and Gustavus Vasa of Sweden.

ARCHER, a co. in n. Texas, of about 900 sq. m., newly organized and thinly settled, but favorable for cattle raising and the growth of cereals. There are also valuable minerals, bismuth among them.

ARCHER, JOHN, 1741-1810; b. Md.; the first man in the United States honored with the degree of doctor of medicine. He was an officer in the army of the revolution; member of the Maryland general assembly, and representative in congress from that state for three terms, 1801-7.

ARCHER FISH, a name given to certain small East Indian fishes of the acanthopterygious family of *squamipennes* or *chatodontidae*, which have the faculty of projecting drops of water with sure aim at insects, and thereby causing them to fall into the water, where they are instantly seized as prey. *Toxotes jaculator*, one of these species, is a fish about 6 or 7 in. in length, a native of Java and other parts of the Indian archipelago, and is that to which the name A. F. has been more strictly appropriated. It can project a drop of water to the height of 4 or 5 feet. It is the only known recent species of its genus, but there is a fossil one. *Chelmon rostratus*, also a Javanese fish, possesses the same power, and the Chinese in Java keep it in jars for their amusement, causing it to practice its art by placing insects within its range.

ARCHERS and ARCHERY. Archers are soldiers whose weapons are the bow and arrow. Among the ancients specially eminent in this mode of warfare, we may particularize the Thracians, Cretans, Parthians, and Numidians; among the moderns, the Arabians, Germans, and Saracens. The emperor Frederick II. employed Saracenic archers with great effect in his Lombard campaign; and to them is ascribed the victory at Cor-

tenuova in 1237. The archers belonged to the light troops, and their province was to open the battle. The emperor Leo especially lauded the dexterity of the Arabian archers. In later ages, the bow came to be employed in England, where the archers wore light armor, a short sword, and a quiver with twenty or more arrows. At first, these archers fought in small groups; in later years, in large masses. At the battle of Cressy, they formed in divisions of 4000 men, 200 in line and 400 deep. The archers decided the fate of the day in several battles—such as Cressy and Poitiers (1356), Agincourt (1415), Crévaux (1423), Verneuil (1424), and Rovernay (1429). The French archers never equaled the English, in spite of the pains Charles VI. and Charles VII. took with them. The latter organized in 1448 the *Franc-archers*, to which corps every parish had to contribute one man; but this measure was attended with so little success that the king was induced to take Scottish archers into his pay, to make any head against the English. The French archers wore a coat of buffalo-hide lined with strong linen, and were accompanied by shield-bearers. In this manner 2000 bowmen with their shield-bearers fought under the count de Foix at the siege of Bayonne in 1451. The archers universally belonged to the élite of the troops, and received higher pay than the rest. At one period, the arbalest or cross-bow was more in favor than the long-bow. See ARBALEST. Long after the discovery of gunpowder, we find the bow and arrow still used; as, for example, at the siege of Capua in 1500; and the siege of Peineburg in 1502. Nay, even in 1572, queen Elizabeth promised to place at the disposal of Charles IX. 6000 men, of whom the half were archers. The English archers are the subject of frequent mention by our old writers. Chaucer, in his *Canterbury Tales*, speaks of the archer

"Cladde in cote and hode of grene,  
A sheafe of peacock arwes brighte and kene,  
Under his belt he bare ful thirtilie.  
Wel coude he dresse his takel yewmanlie,  
His arwes drouped not with fetheres lowe,  
And in his hand he bare a mighty bowe."

In a treatise on martial discipline, by Ralph Smithie, written in the time of queen Elizabeth, we have a picture of the English archer two centuries after Chaucer's time: "Captains and officers should be skilful of that most noble weapon the long-bow; and to see that their soldiers, according to their draught and strength, have good bowes, well nocked, well strynged, everie stryng whippe in their nocke, and in the middes rubbed with wax braser, and shutting-glove, some spare strynges trymed as aforesaid; every man one shefe of arrows, with a case of leather defensible against the rayne, and in the same four-and-twenty arrowes, whereof eight of them should be lighter than the residue, to gull or astoyne the enemye with the hailshot of light arrowes before they shall come within the danger of their harquebus shot. Let every man have a brigandine or a little coat of plate, a skull or hufkyn, a maule of leade of five foote in lengthe, and a pike, and the same hanging by his girdle with a hook and a dagger."

Among the Asiatic Turks, the Persians, the Tartars, and other nations of the east, as well as the American Indians, the bow and arrow are still used as weapons of war. In Europe, they are nearly abandoned for military purposes. The chief differences between the two kinds of weapon employed by the archers of the middle ages are noticed under ARBALEST; BOW AND ARROW.

Although archers are still included among the fighting-men of barbarous and semi-barbarous nations; in England, archery is now nothing more than a pastime, encouraged by archery clubs or societies. In this sense, however, archery is experiencing a revival, being healthful as an out-door exercise, even if no further useful. During the reign of Charles II., archery was much patronized by the court, Tothill fields being the chief scene of exercise. After his reign, archery fell into desuetude for about a century. In 1776, a Mr. Aston revived archery in the neighborhood of London; and very shortly there were several toxophilite or archery societies formed. The system survived till 1793, when another period of inactivity supervened, lasting till 1844. In this last-named year, archery was revived in Yorkshire, and has since gone on extending every year. A recommendation to the sport is that ladies can take part in it—one of the few open-air pastimes of which this can be said. In the modern exercise of archery, there are several varieties of contests between the antagonistic parties; but the usual variety is target-shooting. In archery-matches, a number of prizes are generally awarded, the principal being for the greatest number of arrows shot into any part of the target, and for the nearest approach to the exact center. The target has a gold spot in the center, a red ring around this, then a blue ring, then a black, and outside of all a white ring bordered with green. The merit of the shooting consists in a near approach to the exact center or "gold." Two targets are generally used in a match, on opposite sides of the field, each by one party. The apparatus mostly used at these archery meetings is: 1, the bow, varying in weight according to the strength of the person who is to use it; 2, the arrow; 3, the quiver, a tin case for holding arrows not immediately in use; 4, the pouch; 5, the belt for holding the arrows actually in use. The tassel of the belt serves to clean the arrows when dusty. 6, the brace, buckled round the left arm, to protect it from being hurt by the string when shooting; 7, the shooting-glove, formed to protect the three fingers used in drawing the string. Besides these articles and the target, archers are sometimes provided with a large case called an "ascham," fitted

up with the necessary drawers and compartments for the reception of the bow, arrows, string, and other necessary accouterments.

In archery competition, the total number and value of each person's hits are registered on a scoring-card. The shots are usually punctured on a card with a pin, as being preferable to pencil or ink marks; and the mode of ascertaining the value of the hits, which is increased in proportion as they reach the center, will be seen by the following example:

FORM OF THE SCORING-CARD.

Names.	Gold.	Red.	Blue.	Black.	White.	Total.	Value.
A.....	..	....	.....	.....	.....	35	119
B.....	.	..	.....	.....	.....	26	90

It appears by the card that A has 2 in the gold, 4 in the red, 6 in the inner white, 10 in the black, and 13 in the outer white, making a total of 35. The real value of these is ascertained by multiplying the hits in the gold by 9; in the red, by 7; in the blue, by 5; in the black, by 3; and by leaving without alteration the number in the white or outer. By this process it will appear that A's numbers, according to the value of each circle, amount to 119, and B's to 90—hence A is the winner by 29. But A's total might have been less than B's, and still he might have been the winner, providing the shots had lain more towards the gold than B's.

As an instance of the skill which long and careful practice may insure, Mr. Horace A. Ford, who has written an excellent work on archery, on one occasion, out of 144 shots, made 143 hits—765 score; on another, 144 shots, 137 hits—809 score; and on another, 75 shots, 75 hits—555 score.

**ARCHES, COURT OF** The name is derived from the ancient place of sitting, which was in the church of St. Mary of the Arches, now usually called Bow church, London. The old church, which was destroyed in the great fire of 1666, had a fine arched crypt, whence came the name. The C. of A. is the court of appeal of the archbishop of Canterbury, as metropolitan of the province, and the judge is styled the dean of the arches. Appeals from decisions of the C. of A. are heard before the judicial committee of the privy council. The C. of A. is empowered to hear such suits as are sent up to it by letter of request from the consistorial courts of the bishop of the province of Canterbury after they have issued commissions of inquiry and the commissioners have made their report. The official principal of the C. of A. is the only ecclesiastical judge who is empowered to pass a sentence of deprivation against a clerk in holy orders.

**ARCHIAS, AULUS LICINIUS**, a Greek poet of the 2d c. B.C., defended by Cicero in one of his most noted orations. He passed his life almost entirely in Rome and among Romans, serving under L. Lucullus, Sulla, and other eminent commanders. Cicero and Quintilian praise his gift of extemporization, the richness of his language, and his wealth of thought.

**ARCHIATER, or ARCHIATOR**, "principal," or "chief physician," a complimentary title given by some Roman rulers to their favorite medical attendants, who were usually Greeks. The use of the title and the office spread to all large towns, and a certain number of doctors were selected as archiatri, with salaries and perquisites, but required to minister to the poor without charge. They also served in the same capacity as modern health officers. A similar medical order is still found in some of the Scandinavian countries.

**ARCHIBALD, ADAMS G.**, b. 1814; an English colonial statesman. He was a native of Nova Scotia, and was twice chosen to the colonial legislature, in 1851 and 1855. In 1856 he was solicitor-general, and one of the liberal leaders, and was again sent to the legislature. He was president of the council in the cabinet formed by Sir John Young, and secretary of state for the province; in 1871 received the office of lieutenant-governor of Manitoba, but resigned the next year.

**ARCHIDAMUS I.**, king of Sparta about 668 B.C.; the 12th of the Eurypontids, son of Anaxidamus. He reigned in the time of war with the Tegea.

**ARCHIDAMUS II.**, King of Sparta, 17th of the Eurypontids, son of Zeuxidamus. He took the scepter after the banishment of his grandfather Lectychides, 469 B.C. In the fourth or fifth year of his reign Greece was shaken by a terrible earthquake, and Sparta was left a heap of ruins. He seems to have been a wise and temperate ruler, moving with deliberation, and more merciful than might have been expected in those days. His only famous child was Agesilaus.

**ARCHIDAMUS III.**, grandson of A. II., King of Sparta, 20th of the Eurypontids. He succeeded his father 361 B.C. In six years afterwards he defeated the Argives and

Spartans, and the next year defended Sparta against Epaminondas. In the sacred war he at first assisted the Phocians, but when Philip came into the field he abandoned them. In 338 he went to Italy as an ally of the Tarentines, and was slain in battle on the same day that Philip won the important victory of Chæroneia.

ARCHIDAMUS IV., grandson of A. III., King of Sparta, 23d of the Eurypontids. In 296 B.C. he was defeated by Demetrius Poliorcetes.

ARCHIDAMUS V., King of Sparta, 27th of the Eurypontids, brother of Agis IV. On his brother's murder, 240 B.C., A. fled, but subsequently obtained the throne through the assistance of Aratus. But he was killed by those who had slain his brother, and so ended the last of the Eurypontids, his sons being passed over and the crown given to Lycurgus, a stranger.

**ARCHIL**, or **ORCHIL**, is a coloring substance obtained from various species of lichens. The A. is not originally present in the lichens, but is developed during a process of putrefaction and fermentation. The lichens, collected from rocks near the sea, are cleaned, ground into a powder with water, placed in tanks, and ammoniacal liquids—such as purified gas liquor or stale urine—added; when, by the combined influence of the ammonia, air, water, and the constituents of the lichens, a violet-colored matter is generated, which appears for a time to dissolve in the water, but finally falls to the bottom of the vat in the condition of a moist powder or paste. The latter is then mixed with some substance like chalk or stucco, to give it consistence. The lichens which yield the best A. in largest quantity, are *roccella tinctoria* and *fuciformis*. The former is called the *Archil* plant, and is obtained in large amount from the Canaries and Cape de Verd island, and the Levant. Another lichen, *lecanora tartarea*, collected from rocks in Sweden, is largely imported into Britain. It is sometimes called cudbear (q.v.), or cudbear lichen, and sometimes white Swedish moss. A. is soluble in water and in alcohol, to either of which it imparts a violet color, with a good deal of a crimson hue. It is much employed in the dyeing of silks, where a beautiful lilac color is required; but though a brilliant rich hue is imparted to the silken fabric, the color is not a permanent one, being easily acted upon by the rays of the sun. Hence the A. is seldom used by itself, and the cloth is first dyed lilac by another coloring matter, and is then passed through an A. dye, which imparts a brilliant lilac hue to the cloth. A. is seldom employed to dye cotton cloth, but it is often used, along with indigo, in the dyeing of woollen cloth; and besides enabling the indigo color to go much further, it imparts its peculiar rich tint to the blue or black cloth or yarn immersed in it; the color, however, so obtained is not so permanent as where the A. is left out. Cudbear (q.v.) and litmus (q.v.) are analogous to A., and are obtained from the same lichens.

The lichen distinguished by the name of the A. plant or lichen, *roccella tinctoria*, grows very sparingly on the southern coasts of England, but abundantly on the shores of the Mediterranean and of the neighboring parts of the Atlantic, where it often covers rocks near the sea, so as to form what has been likened to a sort of turf upon them. The Spanish name is *oreglia*, from which the French *orseille*, the English A. or orchil, and even the botanical name *roccella*, are derived. It is of a substance between cartilaginous and leathery, roundish, pretty erect, branching in a dichotomous manner, of a grayish brown color, with powdery warts (*soredia*); the *apothecia* (q.v.) orbicular, flat, horny, almost black, with a scarcely prominent border. That from the Canary isles is generally regarded as the best. It seldom exceeds the thickness of a pin, and about an inch and a half in length. A less branched and more slender, prostrate, or pendulous variety (*roccella hypomecha* of Bory de St. Vincent) is common at the cape of Good Hope and in the island of Mauritius, and appears in commerce along with the other, but is of very inferior quality. A variety remarkable for its large size, or perhaps a distinct species (*R. flaccida*), is brought from Lima and other parts of the w. coast of South America; it is sometimes as thick as a goose-quill, and 6 or 8 in. long, and is of excellent quality. All these, and *roccella fuciformis*, very generally receive in commerce, and from A.-makers, the name of orchella weed, the different kinds being distinguished according to the countries from which they are imported. They are also popularly called dyer's moss.—*R. fuciformis* now yields perhaps more of the A. or orchella weed of commerce than *R. tinctoria*. It differs from *R. tinctoria* chiefly in being not rounded, but flat, and in having the *apothecia* very distinctly bordered. It grows in similar situations, and is also a native of Britain, but abundant only in warmer climates, as on the coasts of Africa, Madagascar, etc. That from Angola is reckoned of the very best quality.

Among the lichens from which A. is manufactured is the *parelle d'Auvergne* or *orseille de terre* (ground A.) of the French, *variolaria oreina* or *corallina*, which is gathered for this purpose in mountainous districts of the s. of France and other parts of the s. of Europe, and is also an article of export (with other similar lichens) from Sweden to Holland. But the greater facility with which A. of the finest quality can be procured from the species of *roccella*, and the increasing abundance of the supply from different quarters, particularly from Angola, tend to diminish the demand for other lichens.

**ARCHILOCHUS** of PAROS, in Lydia, flourished about 714–676 B.C., and is regarded as the first of the Greek lyric poets, although the origin of the elegy is claimed by Callinus, a writer whose age seems to have slightly preceded that of A. Glimpses of his life, especially of the calamities which befell him, were frequently given in his writings.

His father's name was Teesicles, his mother was a slave called *Enipo*. At an early age, becoming entangled in political contests, he abandoned his native town, and led a colony of the citizens to Thasos. While here, as he informs us in some extant verses, he lost his shield in a battle against the Thracians, yet not through cowardice. Subsequently he was banished from Sparta, to which he had gone, some say because he had vindicated his conduct in running away from the fight, others, because of the licentiousness of his verses. He is said to have gained the laurel-wreath at the Olympic games by an ode in honor of Hercules, but this is doubtful. Having returned to Paros, he took part in the war which broke out betwixt it and Naxos, in the course of which he lost his life, either in battle or by assassination. The Delphian oracle pronounced a curse upon his slayer. Variety, novelty, and satirical bitterness characterized his lyric poems; so much so, that "Archilochian bitterness," and "Parian verse," became by-words in ancient times. He scourged his enemies in the most merciless fashion, and always displayed the most malicious skill in selecting for his sarcasm the points on which they were most sensitive. It is said that Lycambes, who had promised his daughter Neobule in marriage to A., having failed to fulfill the promise, was so severely satirized by the poet, that, to escape ridicule, both father and daughter hanged themselves. Among the ancients, A. was ranked with Homer. They dedicated the statues of both on the same day, and placed the head of A. beside that of Homer on the same bust. It is therefore supposed, and with high probability, that there must have been far more in A. than mere vehemence of satire. Even Plato, who was not likely to err on the side of admiration in such a case, calls him "the very wise;" and Georgias, the rhetorician, is reported to have said, when Plato sent forth his dialogues against the sophists, "Athens has given birth to a new A." There must have been strong sense, and a keen perception of truth in the man, to have won so universal and permanent a reputation. Still the line of Horace—who was a vigorous imitator of him in many respects—proves that "rage" was considered "the special faculty" of A.

"Archilochum proprio rabies armavit iambo."

*Ars Poetica*, line 79.

"Rage hath armed Archilochus with his own iambus."

The word *iambus* was in use before the time of A., and was employed to denote a species of rude raillery, such as flashed out spontaneously under the inspiring excitement of the Bacchic and other festivals. A. was, however, the first to reduce these irregular and capricious effusions to fixed rules. See **LAMBICS**. The semi-pentameter, of which he made abundant use, was called after him *Archilochian verse*.

The fragments extant of his poetry have been edited by Bergk in his *Potæ Lyricæ Græcorum* (Leipsic, 1843).

**ARCHIMANDRITE** (Gr. *archi-*, chief, and *mandra*, a fold or a convent), the title of the highest order of superiors of convents in the Greek church (see **ABBOT**). The Russian bishops are chosen from among the archimandrites.

**ARCHIMEDES**, the most celebrated of ancient mathematicians, was b. at Syracuse about 287 B.C. He is said to have been a kinsman of king Hiero, though he does not seem to have held any public office, but devoted himself entirely to science. In regard to mathematics, we cannot estimate fully the merits of A. without a more exact knowledge of the state of the science as he found it; we know, however, that he enriched it with discoveries of the highest importance, on which modern mathematicians have founded their methods of measuring curved surfaces and solids. Euclid only considers a few curved figures in relation to one another, but without comparing them with rectilinear surfaces and solids. The theorems necessary to this transition are laid down by A. in his treatises "on the Sphere and Cylinder," "on Spheroids and Conoids," and "on the Measurement of the Circle." His demonstration that the area of a segment of a parabola is two thirds of the inclosing parallelogram, is the first real example of the quadrature (q.v.) of a curvilinear space. In his treatise on spirals, he rises to yet higher investigations, which, however, are not very easily understood even by masters of the subject.

A. is the only one of the ancients that contributed anything satisfactory on the theory of mechanics and on hydrostatics. He first established the truth, that a body plunged in a fluid loses as much of its weight as is equal to the weight of an equal volume of the fluid. (See the following article.) It was by this law that he determined how much alloy the goldsmith, whom Hiero had commissioned to make a crown of pure gold, had fraudulently mixed with the metal. The solution of the problem suggested itself to him as he was entering the bath, and he is reported to have been so overjoyed as to hasten home without waiting to dress, exclaiming: "I have found it! I have found it!" (*Eureka! Eureka!*) Practical mechanism seems to have been an equally new science in the days of A.; for his boast, that if he had a fulcrum or stand-point, he could move the world, betrays the enthusiasm with which the extraordinary effects of his newly invented machines inspired him. Among the numerous inventions ascribed to A., is that of the endless screw, and the *cochlea* or water-screw (see **ARCHIMEDES' SCREW**), in which the water is made in a manner to ascend by its own gravity. During the siege of Syracuse by the Romans, he exerted all his ingenuity in the defence of the city. Poly-

bius, Livy, and Plutarch speak with astonishment of the machines with which he opposed the attacks of the enemy. But while giving detailed accounts of his other contrivances, they say nothing of his having set fire to the ships by means of mirrors, a story which is not very probable in itself, and rests on later narratives. When the Romans took the city by surprise (212 B.C.), A., according to the tradition, was sitting in the public square lost in thought, with all sorts of geometrical figures before him drawn in the sand. As a Roman soldier rushed upon him, he called out to him not to spoil the circle! But the rude warrior cut him down. According to his own direction, a cylinder inclosing a sphere was engraved upon his tombstone, in commemoration of his discovery of the relation between these solids—a discovery on which he set particular value. When Cicero was in Sicily as questor, he discovered the tomb hid among briars. His collected extant works were edited by Torelli (Oxf. 1792). There is a French translation with notes by F. Peyrard (Paris, 1808, 2 vols.), and one in German by Nizze (Strals. 1824). The *Arenarius* was translated into English by G. Anderson (Lond. 1784). The object of the treatise is to prove that it is possible to assign a number greater than that of the grains of sand that would fill the sphere of the fixed stars, the diameter of which A. assumes at a certain number of stadia. The difficulty lay in expressing such a vast number by means of the clumsy notation of Greek arithmetic, and the device by which the difficulty is eluded is considered as affording a striking instance of A.'s genius.

**ARCHIMEDES**, the **PRINCIPLE OF**, is one of the most important in the science of Hydrostatics, and is so called because the discovery of it is generally ascribed to the Syracusan philosopher. It may be thus stated: A body when immersed in a fluid loses exactly as much of its weight as is equal to the weight of the fluid it displaces; or: A fluid sustains as much of the weight of a body immersed in it as is equal to the weight of the fluid displaced by it. It is proved experimentally in the following way. A delicate balance is so arranged that two brass cylinders, A and B, may be suspended from one of the scale-pans, the one under the other. The lower cylinder, B, is solid, or closed all round, and fits accurately into the upper cylinder, A, which is hollow. When the two cylinders are placed under the one scale, pan-weights are placed upon the other until perfect equilibrium is obtained. The cylinder B is now immersed in water, and in consequence of the buoyant tendency of the water exerted upon it, the equilibrium is destroyed; but it may be completely restored by filling the hollow cylinder, A, with water. The amount of weight which B has lost by being placed in the water, is thus found to be exactly the same as the weight of a quantity of water equal to its own bulk, or which is the same thing, to the quantity of water displaced by it. When bodies lighter than water are wholly immersed in it, they displace an amount of water of greater weight than their own, so that if left free to adjust themselves, they swim on the surface, only as much of their bulk being submerged as will displace a quantity of water weighing the same as themselves. Accordingly, while bodies heavier than water displace, when put into it, their own bulk, bodies lighter than water displace, when allowed to float on the surface, their own weight of the fluid. Bodies of the same weight as water, according to the principle of Archimedes, have no tendency to rise or sink in it, for the water displaced by them weighs precisely the same as they do. The pretty scientific toy called the Cartesian diver is intended to illustrate this. Although the principle of Archimedes is generally established with reference to water, its application extends equally to bodies immersed in air or any other fluid.

**ARCHIMEDES' SCREW** (called also the *spiral pump*), a machine for raising water, said to have been invented by Archimedes, during his stay in Egypt, for draining and irrigating the land. Its simplest form consists of a flexible tube bent spirally round a solid cylinder, the ends of which are furnished with pivots, so as to admit of the whole turning round its axis. The machine is placed in an inclined position, so that the lower mouth of the tube may dip below the surface of the water to be raised. The lowest bend of the tube will be filled with water, and if now the handle be made to turn in the direction of the hands of a watch, the mouth of the spiral tube will be raised above the surface; and the water inclosed in the tube, having no means of escape, will flow within it until, after one revolution, it will occupy the second bend. The first bend has meanwhile received a second charge, which, after a second revolution, flows up into the second bend, and takes the place of the first charge, which has now moved up to the third bend. When, therefore, as many revolutions of the cylinder have been made as there are turns in the spiral tube, each of the lower bends will be filled with water; and in the course of another revolution, there being no higher bend for the water of the first charge to occupy, it will flow out of the tube by its upper mouth. At each succeeding revolution, the lowest bend will be charged, and the highest discharged. It will be seen that there may be room to dispose a second tube side by side with the first, round the cylinder, in which case the screw would be called double-threaded. In the ordinary construction of these machines, the cylinder itself is hollowed out into a double or triple threaded screw, and inclosed in a water-tight case, which turns round with it, the space between the threads supplying the place of tubes. It is sometimes found convenient to fix the exterior envelope, and to make the screw work within it, the outer edge of the latter being as close as possible to the former without actual contact. This modification

of the A. S. receives the name of water-screw, and frequently of Dutch screw, from its being extensively used in Holland for draining low grounds.

**ARCHIPELAGO**, a term (of doubtful etymology) applied originally to that gulf of the Mediterranean which separates Greece from Asia; but now extended to any sea, like it, thickly interspersed with islands, or rather to the group of islands themselves. The islands in the Greek archipelago or *Ægean* sea consist of two groups, called Cyclades and Sporades; the first from their being massed after the manner of a circle, the second from their being scattered in something of a line. The former lie to the east of southern Greece, while the latter skirt the w. of Asia Minor.

Of the Cyclades the principal islands are: Lyra, Kythnos, Thera, Tenos, Andros, Naxos, Melos, and many more of inferior size. They all belong to *Greece*, and will more conveniently be considered in connection with it. The chief islands of the Sporades are: Scarpanto, Rhodes, Cos, Patmos, Nicaria, Samos, Scio, Metelin, Lemnos, Imbros, Samothraki, Thasos, and many more of inferior size. These all belong to Turkey, and constitute a separate vilayet of the empire. Of both groups, the more considerable islands will be noticed, under the alphabetical arrangement, in their respective places.

The other archipelagoes, loosely so called, will receive separate notice each in its proper place.

A remarkable circumstance may be mentioned in connection with archipelagoes. The islands of the globe rarely stand alone. With very few exceptions, they may all be classified into clusters. In most clusters, again, there is generally more or less of similitude between the different members of each—similitude sometimes of one kind, and sometimes of another. Perhaps the similitude that is most obvious even on the face of an ordinary map, is that, really like the links of a chain, the members of a cluster have their lengths, as distinguished from their breadths, in one and the same direction. In the West Indies, for instance, look at the Bahamas, and look also at the Antilles, Greater and Lesser. In the East Indies, again, the same thing is seen in carrying the eye from the n. end of the Philippines to the n. end of Sumatra, or even of the Andamans. Lastly, on the opposite coasts of the upper Pacific, observe the American side upwards from the s. end of Vancouver's island to Mt. St. Elias, and the Asiatic side downwards from the upper extremity of Kamtchatka—which is all but an island—through the Kuriles, to the lower extremity of Japan.

**ARCHITECTS, AMERICAN INSTITUTE OF.** An attempt was made among leading architects to organize this institution about 1836, and again in 1857, but it was not established on a permanent footing until 1867. The office and library are in Trinity building, New York, and it has chapters in many places in the country. The proceedings of the annual conventions include a number of papers and debates on constructional and æsthetical subjects, published with the annual reports of the society. Through its chapters the institute has improved the building laws of the country in various localities, and called public attention to the deficiencies of many national structures. The main object of this institute is to unite in fellowship the architects of this continent, and to combine their efforts so as to promote the artistic, scientific, and practical efficiency of the profession. It proposes to have the laws in relation to public health and safety, as connected with buildings, perfected; and as the profession of architecture has no legal restrictions and no requirement of examinations, the members propose to effect all necessary reforms through the institute. A charge of 5 per cent on the cost of building has been adopted for full professional services, distributed as follows: 5 per cent for full services, of which 2½ per cent are for working drawings and specifications, 1 per cent for detail drawings, and 1½ per cent for superintendence. America can hardly claim to have produced a special school of architecture, but there are many public edifices that deserve to be mentioned as specimens of architectural beauty. Many of our best architects are now designing in what is termed the "colonial" style, which is an adaptation of the Dutch style so much in vogue in this country during the last century. Comparatively little attention was paid to architecture before the civil war, but the growing taste and prosperity of the country have enabled architects to erect many handsome dwelling-houses, which will in no way suffer by comparison with those of European cities. Brick, stone, and iron are now much used in this country, and the Gothic style has been widely adopted for church edifices. Trinity church in New York, completed in 1846, one of the first great Gothic edifices of stone in the United States, Grace church, and St. Patrick's cathedral, in the same city, are fine specimens of that style. The temple Emmanuel is a reproduction of Saracenic forms. The Roman Catholic cathedral in Philadelphia is modeled after the Italian edifices of the time of Michael Angelo. Trinity church, of Boston, is the best example of the Romanesque influenced by the Byzantine, copied from edifices erected in France during the 12th century. The new "Old South church" in Boston is a building of strong form and decoration. The museum of art in the same city inclines to the Venetian Gothic, and among the more prominent of the later renaissance buildings are the Boston and New York post-offices, built of granite, brick, and iron. The lofty *Tribune* building is a noticeable feature of the lower part of New York. The Grand Central railroad depot of New York, and the new Lowell and Providence depots in Boston, are splendid and well-appointed structures. The capitol at

Washington, the corner-stone of which was laid in 1793, is in the style of renaissance. Extensive additions have been made to both wings since 1850. The material used is a handsome marble, the original building being of sandstone. The treasury building and the patent office are in the Greek style, as are the sub-treasury and custom-house, at New York. Of public buildings in Gothic form, a high rank must be given to the Connecticut state capitol at Hartford, the new capitol at Albany, N. Y., and the Ohio capitol at Columbus. Many fine buildings have been erected for commercial purposes in various cities of the United States which justly deserve the title of "business palaces," and are well suited to accommodate our merchant princes. Although architects are somewhat fettered by the small lots of 25 ft. in width prevailing in most of our cities, many dwelling-houses present remarkably handsome exteriors and interiors. Fifth avenue, in New York, is in this respect one of the finest thoroughfares in the world. The apartment houses which have come into fashion since the late war, covering more than one lot, have fared better in an artistic point of view, of which the Stevens house of New York is one of the notable examples. Many beautiful country residences are to be found at Newport, Long Branch, and scattered throughout the country. There is a class of dwellings, however, which deserve severe censure, the so-called tenement-houses of our large cities, in which hundreds of families are crowded, at low rents, without proper accommodations for light, air, or water. But there is a movement to introduce marked improvements in this class of houses. (See Fergusson's *History of Architecture, Ancient and Modern*.)

**ARCHITECTURAL PAINTING** has for its subjects the exteriors or interiors of remarkable buildings; churches, castles, streets in cities, etc. It is mentioned by Vitruvius, but is comparatively a modern art. Benozzo Gozzoli, Ghirlandajo, and the Venetian school, cultivated this department of art in the middle ages; and Pinturicchio, by order of pope Innocent VIII., painted a series of views of cities in the style of the Flemish school, which, under the brothers Van Eyck, had distinguished itself by careful treatment of architectural backgrounds, etc. For a long time, A. P. was regarded only as accessory to other styles of art; but, at the close of the 16th c., P. Neefs, in his views of the interiors of Gothic churches, gave to this branch of the fine arts an independent form; and Steenwyck the younger, in the following century, extended its application in his views of the interiors of prisons, of which his picture of "Peter Liberated from Prison" is an example. The art was still further extended and cultivated by Van der Heijden, Blick, Van Deelen, E. de Ville, Johann Ghering, and others who painted views of church interiors in the Italian style, palaces, and chambers. The interior view of the church of Amsterdam, painted by Ruysdael, deserves especial notice. In the 18th c., the Venetian Canale and his nephew Bellotto (generally known by the name of Canaletto), painted many views of cities, but especially of the canals and buildings of Venice. Collections of their numerous works are found at Dresden, Woburn abbey, etc.

In recent times, A. P. has been very successfully cultivated in Germany, France, England, Holland, and Belgium. Schinkel is celebrated for his fine union of classical taste with richness of decorative invention. His two most striking works are St. Peter's, and the Duomo at Milan; Paul Gropius has shown great talent in his cathedral at Rheims, built in honor of Joan of Arc. His dioramas are well known; and Domenico Quaglio, who d. in 1837, throughout his innumerable compositions, has exhibited an exquisite appreciation of perspective, and of the poetical arrangement of details. Among modern A. painters may be mentioned—in England, Prout (views of Italy, Germany, etc.), Roberts (whose genius has sought for its materials in Spain and the east, and who paints the architecture of foreign lands with rare truthfulness and lively vigor), Mackenzie, Goodall, Williams, and the water-color painters Haghe, Chase, Howse, and others; in France—Granet (d. 1849), the most celebrated art painter of the new French school; and the water-color painters Ouvrié, Garnery, Rochebrune, and Villeret; in Italy—Migliara and Nehrlich (a German, who has been styled "the modern Canaletto"); in Germany—Von Bayer, Hasenpflug, of Halberstadt (who paints beautifully old cloister-alleys under winter-effects), Aimmüller, Vermeersch, Pulian of Düsseldorf (who displays great skill in the representation of old streets and time-worn churches), Conrad, Gärtner, Gröb, Helfft, Dietrich, etc.; in Holland and Belgium—Waldorp, Carsen, Boosborn, Von Haanen, Ten Kate, Springer, and Bossuet.

**ARCHITECTURE** (Lat. *architectura*, from the Gr. *architectōn*, the chief fabricator, the architect), the art of building or constructing. In this country, A. is usually divided into civil, military, and naval. In the present article we shall confine ourselves to the first, the two latter being treated of, the former under the head of **FORTIFICATION**, the latter under that of **SHIP-BUILDING**. Civil A., when taken in the widest sense, may be regarded either from an artistical, a scientific, or a utilitarian point of view. In the first case, as a means of giving external form and sensible expression to mental conceptions or ideas, it is a branch of æsthetics, or of the fine arts properly so called (see **ART**), and takes rank with sculpture and painting; in the second case, it consists in a knowledge of certain laws of physical nature, and a consequent power of calling them into play, or counteracting their operation, and is consequently a branch of that wider department of science to which the name of *mechanics* (q.v.) is given; whereas in the last it becomes a practical art, which has for its object the application of the principles, both artistic and

scientific, which A. embraces, to the elevation of national and individual character, and the increase of the physical comfort and well-being of mankind. But though it admits of being thus analyzed or separated in thought, it must not be imagined that A. can exhibit in practice any one of these principles to the exclusion of the others. The abstract conception of all-pervading deity, as embodied in the Greek temple—the religious aspiration after a personal god, as shadowed forth in the Gothic cathedral—can be realized only in accordance with the principles of mechanics, and the most rigorous adaptation of means to ends; whereas, in an opposite direction, the kraal of the Hottentot, the hut of the Indian in the American wilderness, or even the vulgar chimney-stalk in the dingy manufacturing suburb, if properly constructed for their respective purposes, will be found to have obeyed such æsthetical principles as they may have come in contact with. Nature is not self-contradictory; and art and science, beauty and utility, when rightly understood, are never in conflict. A celebrated German writer and thinker (F. Schlegel) has described A. as “frozen music;” and the comparison is in accordance with the remarks which we have made; for music, though apparently the freest and most lawless, is in reality the most rigorously scientific of the arts. But though a strict adherence to all the principles of A. be indispensable to every genuine architectural structure, whatever be its object, it by no means follows that equal prominence must be given to each of these principles on every occasion. If a building has for its primary object the expression and commemoration of such feelings as grief, gratitude, devotion, or the like, this object manifestly will be best attained by subordinating the scientific and utilitarian to the æsthetic principles of A.; and the reverse will be the case where mere convenience, and also, though in a lesser degree, where convenience, in combination with beauty or magnificence, is sought. It is in a great measure by the prominence which they have given to one or other of these principles, that different nations have displayed their diversities of character in their A. The speculative and poetical character of the Greeks was exhibited in their temples, whilst their preference of the state to the individual appeared in the fact that these structures were designed for the worship of the protecting divinity of the city by the citizen, not for the worship of a personal god by the individual man. Amongst the Romans, again, terrestrial power and material aggrandizement were the exclusively national aspirations, and consequently their A. had their own honor and glory primarily in view. The basilicas, amphitheatres, and triumphal arches of the Romans were their own; but the temples which they raised in honor of the gods were little else than imperfect copies from the Greek, with scarcely any assignable national characteristics. Then, when we come to mediæval times, though, on the revival of spiritual tendencies, æsthetic principles again become prominent, they exhibit themselves under totally different forms; and the distinctions between heathen and Christian thought could scarcely be more distinctly stated in words than they are exhibited to the eye in the difference between a Greek temple and a Gothic cathedral. Even the relation which subsists between Christian and Mohammedan A. (Gothic A. and Arabian A., q. v.) strikingly reminds us of the fact that Mohammedanism was but a sort of bastard Christianity. Domestic life again appeared in full purity and vigor only in modern times; and then only do we see the utilitarian principles of A. finally prevailing over the æsthetic. But apart from the mental characteristics and tendencies of a people, there are many other circumstances which modify their A. Of these, one of the most important is climate. Arrangements for the permanent and commodious residence of the family within doors could not be expected to attain much perfection amongst a race like the Greeks, whose life was spent in the open air; and the climate of Holland, as well as the genius of the people and the character of their occupations, has had much to do with the fact that the Dutch have rarely risen above a town-house. Following thus the peculiarities of national character and circumstances, it is obvious that the more widely these differ in any two nations, the more dissimilar will be the styles of A. which they produce respectively. Moreover, it is apparent that the higher the stage of national development, the more marked will be the character which the A. of a people will assume. A. thus bears a strict analogy to language. Both are an expression of thought, and in the one and in the other, the richness, variety, and precision of the expression will be in proportion to the quantity and quality of the thought to be expressed. Lastly, in the fact that all genuine A. is the expression of the ruling national ideas and forms of thought of some one particular people, we receive the reason why a building compounded of several styles should be characterless and unpleasing; and why this should be more and more the case, the more characteristic the styles compounded, and the greater the equality preserved amongst them. The Doric pillar in itself, and still more, perhaps, the Roman adaptation of it, is the simplest and most rudimentary of all pillars; and what we are in the habit of calling Saxon, is the simplest and most rudimentary of all the styles of Gothic A.; and hence the introduction of a few Tuscan pillars considerably modified into a Saxon or Romanic church, does not awaken feelings of very decided repugnance, whereas an attempt to combine equally the beauties of the Parthenon and of Cologne cathedral in the same building would be unspeakably revolting. The limits of the present article preclude us from presenting to the reader a consecutive account of the origin and development of the different styles of A. These will be treated under separate heads (see EGYPTIAN A., INDIAN A., GREEK A., GOTHIC A., ARABIAN A.; see also ARCH, PILLAR, ARCHITRAVE, etc.); and all that

can be here attempted is to trace the earlier stages through which A. passed in the historical nations, before it reached the point at which it afforded the means of expressing the feelings or supplying the wants of mankind.

1. The earliest stage of monumental A. in every part of the world seems to have been that in which it supplied to the existing generation the means of setting a mark on the face of the earth, of a nature so ineffaceable as that it should continue to be visible to future generations. No attempt was yet made to tell a tale either by the form of the monument, or by any figure or inscription engraven on it. Apart from the tradition intended to accompany it, it was speechless—confessedly unintelligible. But it is easy to see how powerful would be the effect of such an erection in preserving that tradition from oblivion, and fixing it down to the particular locality; for so long as a conspicuous object existed, which obviously was the work of human hands, the cause of its existence would be a subject of curiosity, which could be gratified only by inquiries which must lead to a recital of the events intended to be commemorated. It was with this view that Joshua (xxiv. 26) took a stone, and set it up under an oak that was by the sanctuary of the Lord, "And said unto all the people: Behold, this stone shall be a witness unto us; for it hath heard all the words of the Lord." To this primary class of monuments belong those tumuli or barrows, and conical heaps of stones called cairns, carns, or kearns, which, when they occur in Britain, we perhaps rightly ascribe to the Celtic portion of our forefathers, but which there is much reason to believe have been erected by every race at a certain stage of their progress. The barrow, it is true, is not wholly destitute of architectural arrangements. Occasionally it contains a passage or narrow gallery leading to a square inclosure or small chamber, in which the remains of bones, and of rude urns, drinking-cups, and other articles, sometimes of Roman or Brito-Roman manufacture, are found. The barrows are always, however, of the rudest and most inartificial construction, and in considering them we are only, as it were, on the threshold of architectural science.

2. The earliest class of erections to which this title can with any propriety be given, are those which are commonly spoken of as Druidical temples. These consist generally of separate stones, often of enormous size, raised on their ends, sometimes in a circle, and at other times so as to inclose an oblong space, which in some cases is roofed in by horizontal slabs. These roofing-stones are frequently of such prodigious weight as to give rise to many conjectures regarding the mechanical means by which, and the mechanical knowledge of those by whom, they were placed in the positions in which we see them. These strange, and, to us, almost wholly unintelligible remains of antiquity, when of great extent, assume an air of savage and gloomy majesty. Of this the most conspicuous instance anywhere to be found is that of Stonehenge (q.v.), in Salisbury plain in Wiltshire. Wherever a Celtic population existed, these monuments are to be found. Druidical monuments are more common in France than in England; and in France, as might be expected, they exist in the greatest numbers and variety in Brittany (q.v.), though none of them approach the magnitude, or, in some respects, the workmanship of Stonehenge. The Celtic monuments of Brittany are of different classes, and have received different names—that which is most architectural in character being the dolmen, or cromlech, as it is called in England. The cromlech consists generally of two rows of perpendicular stones, arranged so as to fit pretty closely to each other, and covered with horizontal roofing slabs, thus forming a chamber, which is generally of such height as to allow a man to walk through it upright. But the largest and most perfect specimen of the dolmen is to be seen, not in Brittany, but in the neighborhood of Saumur on the Loire. It measures more than 80 ft. in length. To the same early stage in the science, though probably to a much earlier period in point of time, are to be referred those cyclopean walls and fortifications which at Tiryns and Mycenæ in Argolis excited the wonder of the later Greeks; the Etruscan walls at Fiesole; and the similar structures which are found both in Central and South America.

3. The next stage in advance of that primeval and prehistoric one of which the traces are thus so widely spread, is that at which the science seems to have culminated in all but the classical nations of antiquity, and those races which have had the benefit of their genius and invention. We have here an accurate measurement of parts, and a corresponding division of the building. The pillar also makes its appearance, though it is by no means used with the same freedom, nor does it exhibit the same variety of form to which it attained in Greek A. The stage of which we here speak was attained by the inhabitants of Central and Southern America before its discovery by Europeans; and in Mexico, even by the Toltecs, an earlier race, which had given way before the Mexicans of the days of Cortes. Peruvian A. exhibits neither columns nor arches; but the remains of the palace at Mitla possessed a portico with plain cylindrical columns; and the walls were covered with rude sculpture. In the cloisters of a building at Palenque, a species of inartificial triangular arch, formed by courses of stones projecting over each other, was found. It is very instructive as showing the natural, and, so to speak, necessary character of certain architectural forms at certain stages of national development, to find that the pyramid, which is little more than a regularly constructed cairn, is met with even more frequently in Mexico than in Egypt; and whether or not we regard it as the primary form of the pagoda of India, it certainly formed the basis both of Mexican and Egyptian A. The discussions which have been carried on with so much keenness as to the priority

of date of Indian and Egyptian A., lose much of their importance when we find a race, acting in all probability independently of both, starting from the same primary form as the one, and in the discovery of the pillar and the arch, making two of the most important of the further steps in advance to which they respectively lay claim. Keeping these facts in view, it would seem, moreover, that something more is required to prove an historical connection between Doric and Egyptian A. than the circumstance that the columns which they respectively employ possess a base, a shaft, and a capital, or that both are used to support an entablature. Even the long unbroken horizontal lines which seem to indicate an affinity between the architectural styles of Egypt and of Greece, and which distinguish them both so sharply from the Christian A. of mediæval Europe, may be the result rather of a similarity of circumstances than an identity of origin. Though these styles agree in having columns, and though the columns support horizontal entablatures in each, they disagree in the forms of the columns, in the character of the entablature, and indeed, in almost every other particular. Whilst Greek pillars taper towards the top, and the walls are vertical, in Egyptian buildings the very reverse is the case, the pillars being vertical, and the walls sloped. When the effect of a whole Greek building, surrounded by a colonnade, and of an Egyptian building is considered, a certain similarity appears—the base in each case being wider than the upper part; but the result is produced in the one case by sloping the pillars, and in the other, by sloping the walls, the external edges of which form a slightly acute angle with the base of the building. The great distinction, however, between the A. of Egypt and Greece consists in the stages which they respectively reached. The A. of Egypt retained throughout a character of gloomy strength, and never attained to the lightness, freedom, or variety of that of Greece. In the one case, the traditional forms continued throughout to dominate and subdue the free spirit of art; in the latter, art triumphed over tradition, and owned no laws but its own. It is in this circumstance that the distinction consists between the stage of A. of which Egyptian may be considered the type, and of which Assyrian, Babylonian, and Persian A. are also examples, and that ultimate stage which was reached by the Greeks in one direction, and by the various Germanic nations in another. See ARABIAN A., BYZANTINE A., and GOTHIC A.

**ARCHITRAVE** (Gr. *archi*-, chief; Lat. *trabs*, beam), the lowest part of the entablature (q.v.), or that which rests immediately upon the columns.

**ARCHIVES.** See RECORDS.

**ARCHIVOLT**, the ornamental band or molding which runs round the lower part of the voussoirs of an arch.

**ARCHON**, the highest magistrate in Athens. The government was originally monarchical; but on the death of Codrus (q.v.), the Athenians, according to the traditional account, resolved that no one should succeed him with the title of king (*basileus*), and therefore appointed his son Medon with the title A. (ruler). The office was at first for life, and confined to the family of Medon; but in 752 B.C., the time of office was limited to ten years; and in 714, the exclusive claims of Medon's family to the office of A. were abrogated, and it was thrown open to all persons of noble birth; afterwards to all citizens, without distinction of rank (477 B.C.). In 683, the office had been made annual, and the number of archons had been extended to nine. The year was named from the first A.: to the second, styled Basileus, belonged the care of religious affairs; the third was Polemarchos, or commander-in-chief; and the remaining six, having to conduct all criminal trials, were styled thesmothetæ, or lawgivers.—Among the Jews, during the time of their subjection to the Romans, the title of A. had various meanings; but was generally given to the members of the sanhedrim or supreme council.—In the mystical jargon of the Gnostics, the term A. was frequently employed, and hence one of their sects, especially opposed to Judaism, received the name ARCHONTICS. See GNOSTICS.

**ARCHYTAS** of Tarentum, one of the most illustrious men of antiquity, flourished about the year 400 B.C. His father's name was Mnesagoras. A. is said to have been a contemporary of Plato, and on one occasion to have saved the life of the latter when the tyrant Dionysius wished to put him to death. His public career was glorious. He was seven times elected general of his city, though it was customary for the office to be held only for one year; and in every campaign which he undertook, he was victorious. His civil administration was equally fortunate. Affairs of the highest moment were repeatedly intrusted to him; and yet, though deeply skilled in philosophy and politics, he was possessed of a childlike simplicity of character. He was drowned on the Apulian coast. A.'s virtues were as conspicuous as his talents. He paid the most humane attention to the comfort and education of his slaves, and although one of the greatest geometricians, he did not disdain to make a rattle for the amusement of his children. He solved the problem of the doubling of the cube, and secured almost the reputation of a magician by his numerous mechanical contrivances, the most wonderful of which was the flying pigeon. A Pythagorean in philosophy, he is generally supposed to have exerted a considerable influence on Plato, and some affirm that even the gigantic understanding of Aristotle was indebted to him for the idea of his categories. Only fragments of his writings remain. They relate to metaphysics, ethics, logic, and physics.

**ARCIDOSO**, a t. of central Italy, in the province of Grosseto, 23 m. n.e. from Grosseto, on a feeder of the Umrone, among the Apennines. Pop. of commune, 5859.

**ARCIS-SUR-AUBE**, a small t. in the French department of Aube, situated in lat. 48° 32' n., long. 4° 8' e., with (1876) 2817 inhabitants, is remarkable on account of the battle fought here, Mar. 20, 21, 1814, between Napoleon and the allied forces under prince Schwartzenberg. The battle, beginning with several skirmishes on the first, and ending in a general engagement on the second day, when the French retreated over the Aube, was not in itself very important. But Napoleon now formed the plan of operating in the rear of the allies, and left the road to Paris open; assuming that they would not venture to proceed without attempting first to secure their rear. The allies marched, nevertheless, on the capital, and thus decided the campaign.

**ARCO'LA**, or **ARCO'LE**, a village on the left bank of the Adige, in northern Italy, 15 m. e.s.e. of Verona, famous for the victory gained by Bonaparte over the Austrians, 17th Nov., 1796. The Austrians, relieved by the retreat of Moreau from the Rhine, had begun to take the offensive in Italy, and gen. Alvinzy appeared at the head of 50,000 men, with the main body of which he advanced to Caldiero, and threatened Verona. Bonaparte, recognizing the danger, descended by night the course of the Adige, crossed that river at Ronco, and was thus in a position to threaten the left flank of Alvinzy's army, which was posted at A. A causeway leads from Ronco across the morasses to A., before reaching which, the road crosses the small stream of the Alpon by a narrow bridge. This bridge was defended by the Austrian general, Mittrowsky, with 14 battalions of infantry, and 2 squadrons of cavalry. On the 14th of Nov., Augereau attacked the bridge with two battalions of grenadiers, but being exposed in flank to the Austrian fire, was obliged to withdraw. Bonaparte now seized the standard himself, and rushed on the bridge, followed by the grenadiers; but again the fire of the Austrians, who were in much greater force than the French, made it necessary to draw back. The struggle was renewed on the 16th, with a similar result; and it was only on the 17th that the French succeeded in getting possession of A., not, however, by forcing the bridge, but by sending a column across the Alpon, lower down, and getting in rear of the Austrians. On this Alvinzy was obliged to retreat to Vicenza. It fared no better with the other column of the Austrians under Davidovich. In this series of battles the Austrians lost 18,000 men killed, and 6000 prisoners. The French loss was 15,000.

**ARÇON**, **JEAN CLAUDE D'**, a distinguished French engineer, b. at Pontarlier, 1733, was originally intended for the church, but on manifesting a decided preference for the study of Vauban, his father, an eminent juriconsult, consented to his choice of a military profession. In 1754, he entered the military school at Mézières, and, in the following year, he passed as an engineer. During the seven years' war, he acquired considerable reputation, especially in the defense of Cassel. His fertility of invention was surprising, and of the greatest benefit to that branch of the service with which he was connected. In all his writings—which, in spite of a very faulty style, can be read with pleasure—there are indications of a lively, rich, and vigorous genius. He was even bold enough to question the wisdom of certain strategical propositions of the great Frederick. But his most famous scheme was that by which he hoped to reduce Gibraltar, then in the hands of the English, and defended by governor Elliot. He contrived floating batteries, incombustible, and not liable to sink, which, however, were not successful, though this is mainly to be attributed to the fact of his efforts being indifferently supported. When the French, under Dumouriez, overran Holland, A. took several strongly-fortified places, amongst others, Breda. After this, he retired from public life, and confined himself to the literature of his profession. His most important work is *Considérations Militaires et Politiques sur les Fortifications* (Paris, 1795). In 1799, Bonaparte called him to the senate, but he died the year after.

**ARCOS DE LA FRONTERA**, a t. on the right bank of the Guadalete, in Andalusia, Spain. Its principal manufacture is that of tanned leather, which was the first established in Andalusia; thread and ropes are also manufactured. Pop. 11,270. A. de la F. has a wild and romantic situation, which harmonizes well with the picturesque garb of the inhabitants, who still wear the old national costume. It was called Arcos, from being built in the form of a "bow;" and after Alfonso-el-Sabio had rescued it from the Moors, it received the additional name of *de la Frontera*, from its frontier position, being in the vicinity of the Moorish kingdom of Granada. Almost impregnable by nature, it was furthermore embattled with walls and towers, part of which still remain, and afford a magnificent view of the Ronda mountains. The rich plains that lie below the rocky town are famed in the Spanish ballads for their breed of war-steeds, "Arcos barbs."

**ARCOT**, a city of Hindostan, in the presidency of Madras, the capital of the district of north Arcot. It is situated on the right bank of the Palar, a river which, rising in Mysore, is, in the rainy season, about  $\frac{1}{2}$  m. wide before the town. It stands in n. lat. 12° 54', and in e. long. 79° 24', and is distant from Madras 65 miles. Besides the military cantonment, which can accommodate 3 regiments of cavalry, A. contains some mosques in a tolerable state of repair, and the ruins of the Nawaab's palace. At the census of 1871, the t. of A. (more properly spelled *Arkot*) had a pop. of 10,988. A. is chiefly notice-

able for its history. It was the spot where Clive first firmly established his military reputation. With a force of 300 Sepoys, 200 Europeans, and 3 field-pieces, he marched against A., which was garrisoned by 1100 men; and after having taken it, he stood a siege of 50 days against thousands of assailants, amid hardships and privations of every description.

**ARCOT**, a portion of the presidency of Madras. It consists of 2 districts, the northern and the southern, of which the respective areas are 7139 sq. m., and 4873, and the respective populations, according to the census of 1871, 2,015,278 and 1,755,817.

As most of the rivers are destitute of water in the dry season, there are thousands of tanks in A. Some of them are of an enormous size: that of Caverry-pak, in particular, measures 8 m. by 3. These tanks are indispensable, as well for irrigation as for domestic use. The hot and parching winds from the w., sweeping down the valleys of the eastern ghats, are often fatal to birds on the wing, and also to human beings when exposed for any length of time. Glass cracks and flies in pieces; and wood shrinks, splits, and shivers; and from the mutual friction of the sapless trees, spontaneous combustion sometimes takes place in the jungles.

**ARCTIC** means, properly, lying near the constellation of the bear (Gr. *arctos*), and hence, northern. The arctic circle is a circle drawn round the north pole, at a distance from it equal to the obliquity of the ecliptic, or  $23\frac{1}{2}^{\circ}$ . The corresponding circle round the south pole is the *Antarctic* circle. Within each of these circles there is a period of the year when the sun does not set, and another when he is never seen, this period being longer the nearer to the pole.

**ARCTIC CURRENT** comes from the northern ocean down Davis's strait and also down the e. coast of Greenland, joins the Labrador current off cape Farewell, flows along the Newfoundland coast, and is lost in the gulf stream. Its water is very cold, and has the effect of lowering the temperature of the Labrador coast.

**ARCTIC HIGHLANDS**, a name sometimes applied, though not very appropriately, to that portion of the American continent which lies between Hudson's bay and the mouth of the Mackenzie. It has been the scene of all, or nearly all, the overland efforts in connection with the exploration of a n.w. passage, from Hearne's discovery of the Coppermine, down to the recent voyage of Anderson—the most prominent among the intermediate laborers having been Franklin, Richardson, Back, Dease, Simpson, and Rae.

**ARCTIC OCEAN**, that part of the universal sea which surrounds the north pole. Its single boundary, that towards the s., naturally divides itself into four sections—the northern shores respectively of the two continents, and the northern limits respectively of the two intercontinental oceans.

The A. O. meets the Pacific at Behring strait, in about  $66^{\circ}$  of n. lat., so that here the A. O. overlaps the arctic circle by about  $30'$ . On the side of the Atlantic, again, the common border seems to be equally independent of arbitrary definition, for Scoresby sound almost as definitely terminates the s.e. coast of Greenland as North Cape terminates the n.w. coast of Europe; so that, as both extremes are intersected by about the same parallel of  $71^{\circ}$ , the A. O. here falls short of the arctic circle by about  $4\frac{1}{2}^{\circ}$ .

In the old world, the A. O., if we include its gulfs, stretches s. of the arctic circle, in the White sea, fully  $2^{\circ}$ ; while at cape Severo, the most northerly point of Asia, in lat.  $78^{\circ} 25' \text{ n.}$ , it falls short of the same by  $11^{\circ} 55'$ . Lastly, within the range of the new world, the A. O., in its strict acceptance, is everywhere forced back within the arctic circle, about  $5^{\circ}$  at Point Barrow, about  $7\frac{1}{2}^{\circ}$  on Barrow's strait, and about  $3^{\circ}$  at the strait of the Fury and Hecla.

The waters of the A. O., however, may conveniently be extended beyond these their strict limits. So far as the mere aspect of the map is concerned, Davis's strait, Baffin's bay, and Hudson's bay may be regarded as gulfs rather of the Atlantic than of the A. O. But if essential characteristics are permitted to outweigh mere position, they must be assigned rather to the A. O. than to the Atlantic. Besides being all fed by currents from the A. O., they are all hyperborean in temperature. Even the most southerly of the three illustrates this. While Hudson's straits present, in general, more ice than Davis's strait or Baffin's bay, Hudson's bay itself has been the scene of perhaps the two most abortive, if not most disastrous, of all modern attempts at northern discovery. On opposite sides of Southampton island, Lyons and Black were arrested by impenetrable packs, the one near the bay of God's Mercy, and the other off cape Comfort—the latter point being  $1\frac{1}{2}^{\circ}$ , and the former being twice as much, s. of the arctic circle. Reckoning, therefore, to the bottom of James's bay, as an arm of Hudson's, the arctic seas, thus appended to the A. O. proper, reach as far s. as the parallel of London.

Little as is yet known, at least accurately, of the A. O., its discovery and exploration have developed and tasked more skill and heroism than perhaps the exploration and discovery of all the rest of the world since the age of Columbus. Without anticipating what is to be said on this subject under the heads of NORTH-EAST PASSAGE, NORTH-WEST PASSAGE, and POLAR EXPEDITIONS, it may not be out of place here to state summarily the comparatively easy labors of the Russians while issuing, as it were, from their domestic rivers to survey their domestic shores. About a century and a quarter ago, the Muscovites simultaneously sent forth five expeditions to complete, if possible, the n.e. passage. From the White sea to the Obi, four seasons were consumed; from the Obi to

the Yenesei, four seasons; from the Yenesei to the Lena, season after season was spent in both directions without success; from the Lena to the Kolyma, six seasons were occupied; from the Kolyma to the Pacific every effort was fruitless, though the Cossack Deshneff was known to have accomplished this part of the enterprise about a century before.

Arctic navigation, in fact, is beset by almost every imaginable difficulty and danger. In addition to the peculiar perils of ice in all possible states, the adventurer, often blinded by fogs and snows, has to face, generally without guide or sea-room, the storms, tides, and currents of comparatively unknown waters. If such be his three months of summer, what must be his nine months of winter! Take a general illustration from the personal experience of the most successful of all the arctic navigators. On the parallel of  $73^{\circ}$ , and under a temperature of  $15^{\circ}$  below zero of Fah., capt. McClure spent the night of 30th Oct. 1851, on the ice, amid prowling bears, and that without food or ammunition—his only guide being a pocket-compass, which, however, the darkness, thickened by mist and drift, rendered useless. The gallant officer whiled away the time by sleeping three hours on "a famous bed of soft dry snow," and by wandering 10 m., by the crow's flight, over a surface so rugged as to endanger his limbs. It was at the close of a pedestrian expedition of nine days, on very short allowance of food and water, that the adventure took place; and it had been immediately occasioned by a generous desire of reaching the winter quarters by a nearer cut, so as to have "a warm meal ready for his men on their arrival."

Notwithstanding the labors and researches of two centuries and a half, very little of this vast ocean has been even seen by man. To the n. of  $83^{\circ} 30'$ , in fact, the A. O., so far as authentic evidence goes, is a mere blank to geographers, for Parry, in 1827, barely reached lat.  $82^{\circ} 45'$ ; Kane, in 1854, touched only  $81^{\circ} 23'$ ; the *Polaris*, in 1871, reached only  $82^{\circ} 16'$ ; in 1874, the Austro-Hungarian polar expedition just reached  $83^{\circ} 5'$ ; and the British expedition of 1875-6 could advance no further than  $83^{\circ} 20'$ , the highest latitude ever attained. At all the intermediate points of longitude, the northern limit of geographical knowledge falls short, more or less at every point, of the parallel of  $83^{\circ}$ . Perhaps the actual average of such northern limit, even on the full tale of  $360^{\circ}$  of long., may not exceed lat.  $75^{\circ}$ , so as to leave absolutely unknown a circle of  $30^{\circ}$  of lat., or nearly 2100 miles in diameter—an area little inferior to that of Europe. This untrodden world, however, is not to be regarded as a continuous wilderness of ice. Parry, at his furthest point, found not an unbroken field, but separate floes, with more or less of open water between them—the mildness of the temperature being indicated by falls of rain; and Kane, again, at his furthest point, saw a free sea to the n., as far as the eye could reach, from a promontory 240 ft. high; while, to use his own words, "a gale from the n.e., of 54 hours in duration, brought a heavy swell from that quarter without disclosing any drift or other ice." This is quite in keeping with the fact already noticed, that Hudson's straits and bay are often more encumbered with pack than the waters of far higher latitudes. With regard to currents, Parry, during nearly the whole of his boat-sleigh expedition of 1827, found that his place by reckoning was considerably ahead of his place by observation, or, in other words, that his northward progress on the floes was neutralized more or less by the southward progress of the floes themselves, the existence of a current towards the s. being thus shown. McClure derived advantage from the current, whether advancing through open water or drifting along at the mercy of the pack. The experience of Weyprecht and Payer was different from that of any preceding navigators, since they found that they steadily drifted *north*. While McClure had the fortune to return with the news of the discovery of the n.w. passage, McClintock has shown that the discovery must have been anticipated by Sir John Franklin. Succeeding expeditions, of which a great number have been equipped by England, Germany, France, Sweden, America, Austria, and Denmark, have been mainly directed towards the north pole. The reports of the expedition of 1875-6 lead to the conclusion that the pole is surrounded by an inaccessible region of ice, to which has been given the name of the palæocrystic sea, or sea of ancient ice.

Of the more southerly portion of the A. O., the only section that is tolerably well known to a distance from the continent is that which washes the n.e. of America. It contains, under the collective name of polar archipelago, these islands, or parts of islands: Banks land, Prince Albert land, Wollaston land, Victoria land, Prince Patrick island, Princess Royal islands, Melville island, Cornwallis island, north Devon, Grinnell land, north Lincoln, and various others. Off the coast of the old world, again, are Spitzbergen, Nova Zembla, New Siberia, Wrangel land, King Charles land, etc. The latest discovery, made by Weyprecht and Payer in 1873, is that of Franz-Joseph land, an extensive and mountainous tract, lying about 200 m. due n. of Nova Zembla. Its s. coast is in about  $80^{\circ}$  n. lat., and it was seen to extend as far n. as  $83^{\circ}$ , occupying at least  $15^{\circ}$  of longitude. The chief straits are Lancaster sound, Barrow's strait, Smith's sound, strait of the Fury and Hecla, Wellington channel, Banks strait, etc. The chief rivers, all of them on the mainland, are the Obi, the Yenesei, and the Lena, of the first class; the Mackenzie, the Yana, the Indigirka, and the Kolyma, of the second; and many others of the third.

The principal production of the A. O. has been the whale. The whale-fisheries on the w. coast of Spitzbergen, and on both sides of Greenland, scarcely need to be mentioned. But

it may not be generally known, that, according to official returns as quoted by admiral Beechy, the Americans had, in two years, drawn more than 8,000,000 of dollars, or upwards of £1,600,000 sterling, from the whale-fishery of Behring strait alone.

On the side of east Siberia, however, the A. O. produces a more remarkable article of traffic. Here are found, in the greatest abundance, the bones of the mammoth. Spring after spring, the alluvial banks of the lakes and rivers, crumbling under the thaw, give up, as it were, their dead; while the islands lying off the Yana, and even the depths of the sea itself, literally teem with these mysterious memorials of antiquity.

The American half of the A. O., if it cannot boast of fossil ivory, presents something still more difficult perhaps to be explained. In lat. 74° 25', and lat. 76° 15' respectively, capt. McClure and Lt. Meham discovered large deposits of trees, apparently indigenous, of considerable size. Writing of Banks' island, McClure has the following passage: "From the summit of these hills, which are 300 feet high, to their base, abundance of wood is to be found, and in many places layers of trees are visible, some protruding 12 or 14 ft., and so firm that several people may jump on them without their breaking: the largest trunk yet found measured 1 ft. 7 in. in diameter"—equivalent in girth to about 5 ft. Again, "I entered a ravine some miles inland, and found the n. side of it, for a depth of 40 ft., composed of one mass of wood. Some of it was petrified, the remainder very rotten, and worthless even for burning." Writing of Prince Patrick island, Meham has the following passage: "Discovered buried in the e. bank of the ravine, and protruding about 8 ft., a tree of considerable size. During the afternoon I found several others of a similar kind: circumference of first and second tree seen, 3 ft.; of another, 2 ft. 10 in. From the perfect state of the bark, and the distance of the trees from the sea, there can be but little doubt that they grew originally in this country."

**ARCTIUM.** See BURDOCK.

**ARCTOMYS.** See MARMOT.

**ARCTURUS**, the principal star in the constellation Bootes (the "herdsman"). A. is o. of the first magnitude, and one of the most conspicuous objects in the northern heavens. Its right ascension is 14 h. 10.2 m. and declination 19° 49' n.

**ARCUEIL**, a French village, about 4 m. s. of Paris; pop. about 6000. The place is celebrated as the residence of the chemist Berthollet, and also for the ruins of an aqueduct made by order of the Roman emperor Julian to convey water to his residence.

**ARCUS SENILIS**, a not very well chosen term for a change occurring in the cornea of the eye, in consequence of fatty degeneration of its marginal part. The term is objectionable, because the change usually commences before the advent of old age, and further, because the *arcus*, or arch, is usually converted into a complete circle by the time that the patient has reached the age of 60 or 70 years. The *arcus senilis* usually commences at or even before the age of 40 years, as an opaque whitish crescent, skirting either the upper or lower margin of the cornea; and from this commencement it extends along the edge, till it finally becomes a complete circle, which sometimes assumes a chalky whiteness, and gives to the eye a very peculiar appearance. On careful examination, it may be seen that a narrow interval of partially clear cornea always intervenes between the *arcus* and the opaque sclerotic. As far as the eye is concerned, the formation of this circle is of little importance, but it is of great diagnostic value to the physician if, as Mr. Canton and several late observers maintain, its presence indicates the coexistence of fatty degeneration of the heart.

**AROY, GROTTO OF**, a remarkable cavern 12 m. e. from Auxerre, France. It is supposed to have been used in early times as a stone quarry, and possibly the material for the Auxerre cathedral was taken from it. One of its divisions is 400 yards long, 26 high, and 14 wide.

**ARD**, or **AIRD**, a Celtic root, meaning "height" (cf. Lat. *arduis*, high), which appears in many geographical names, especially in Ireland and Scotland.

**ARDAHAN**, a village of about 300 houses in the portion of Turkish Armenia ceded in 1878 to Russia, 35 m. n.w. of Kars. Its position gives it strategic importance. Its fortress was dismantled by the Russians in the war of 1854-56; in 1878, the Berlin congress sanctioned the cession to Russia of A., which had been captured early in the war. On account of the severity of the climate, the houses of A. are mainly constructed underground.

**AR'DEA.** See HERON.

**ARDEBIL**, or **ARDABIL**, a t. in Persia, 38° 15' n., 48° 19' e., in a fertile plain, 40 m. from the Caspian sea, apparently built from the ruins of a former city. It is surrounded by a wall of mud, with towers and fortified bastions at the corners. Its sacred treasure is the tomb of Shah Ismael Sufi, founder of the Sufi dynasty of Persia. Nadir Shah was here crowned king after the great council of the empire in 1736. A. is an emporium of trade for Tiflis, Derbend, Boku, Ispahan, and Teheran. From remarkable salubrity of climate it has acquired the title of "abode of happiness."

**ARDECHE**, a department in the south of France, taking its name from the river A., a tributary of the Rhone, includes the most northern part of ancient Languedoc. Great

est length from n. to s., 74 m.; greatest breadth, 44. Area, 2130 sq.m.; pop. '76, 384,378. A. is almost wholly mountainous. In the northwest of the department, the Cevennes culminate in the volcanic mont Mezène, 5972 ft. in height. The variety of the numerous extinct volcanic peaks, deep craters, rugged valleys, masses of tufa, grottos, rock-labyrinths, ranges of basaltic columns, gigantic dams, etc., give a most extraordinarily picturesque appearance to the scenery. The upland, which has winter for six or eight months, is devoted to pasturage; but the terraces and valleys near the Rhone enjoy a warm climate, and produce good wine (white and red), olives, figs, almonds, chestnuts, etc. There are manufactures of silk, paper, leather, iron, etc.; and good roads, with water carriage, facilitate commerce. Lead, iron, copper, manganese, etc., are wrought. The chief towns are Privas, Aubenas, Bourg, St. Andéol.

**ARDEE**, a t. in the west of Louth co., Ireland, on the river Dee, 12 m. inland. It contains two ancient castles—one built about the year 1200, and now used as the town-house; the other, a square building, and now used as a prison. The chief trade is in corn and other agricultural products. The pop. in '71 amounted to 2972.

**ARDENNES**, the western division of the slate-plateau of the lower Rhine. It extends over portions of Belgium, France, and Rhenish Prussia, and consists of a broken mass of hills, for the most part of no great elevation, which gradually slope towards the plains of Flanders. In early times, the name was given to the whole of the region lying between the Rhine and the Sambre, a length of about 160 miles. The average height of the hills is less than 2000 ft.; but in the east, mont St. Hubert attains an elevation of 2300 feet. Large tracts of this region consist not of hills, but of gently undulating plateaus, which are densely covered with oak and beech forests, while other portions are marshy, heathy, and barren. The districts through which the Meuse and other rivers flow, present some extraordinary appearances. The channel of the river is sometimes bound in by rugged and precipitous cliffs more than 600 ft. high. The principal rocks of the A. are clay-slate, grauwacke, quartz, etc., interspersed with extensive strata of primitive limestone. Coal and iron mines are wrought in the northwest; lead, antimony, and manganese are also found. There is little cultivation of grain, but multitudes of cattle and sheep are reared.

**ARDENNES**, a frontier department in the northeast of France, bordering upon the provinces of Namur and Luxembourg in Belgium. It formed a part of the old province of Champagne. Length, from n. to s., 63 m.; breadth, from e. to w., 60; area, 2020 sq.m.; pop. '76, 326,782. The northeast of A. belongs to the basin of the Meuse; the southwest is watered by the Aisne; both of these rivers are enriched with affluents, and united by the *Canal of A.* About one eighth of the whole surface is hilly, and covered with forests and wide tracts of pasturage. In the north extremity of the department, near Givet, marble is obtained; but the prevailing rock is limestone, veined with lead and iron. South of this, and stretching across the department, from e. to w., are great layers of slate, with here and there flint, quartz, etc. In the southeast, muschelkalk, rich in iron-ore, abounds; and in the southwest the soil is composed of arid chalk, a naked, treeless, elevated plain. Only the valleys are fertile, and produce corn. The vine is only cultivated at Mézières, in the southwest. Slate, marble, and iron, porcelain-clay, and sand for making glass are obtained. Excellent work-horses and sheep are reared. There are manufactures of earthenware, glass, marble, woolen cloths, metallic wares, etc. The principal towns are Mézières, Rethel, Rocroy, Vouziers, and Sedan, where Napoleon III. surrendered to the Prussians, Sept. 2, 1870.

**ARDESHIR**, or ARDSHEER, BĀBEGAN. See ARTAXERXES LONGIMANUS, *ante*.

**ARDNAMURCHAN POINT**, the n.w. promontory of Argyleshire, and the extreme western point of the mainland of Britain. A light-house was erected here in 1849, which is visible at a distance of 20 miles. For 10 m. around, the country consists of trap, resting on sandstone often hardened, and blue slates. The trap veins form many striking reticulations in the strata. S. of the point are found numerous oolitic and lias fossils.

**ARDOCH**, a small village in Scotland, co. of Perth, 8 m. s.s.w. of Crieff, celebrated for a Roman camp, the most entire now in Britain. The camp is  $2\frac{1}{2}$  m. n. of the Greenloaning station of the Caledonian railway, in the grounds of A. house. The intrenched works form a rectangle 500 by 430 ft., the four sides facing the cardinal points. The n. and e. sides are protected by five ditches and six ramparts, these works being 270 ft. broad on the n. side, and 180 ft. on the e. A deep morass exists on the s.e., and the perpendicular banks of Knaig water, rising 50 ft. high, protect the camp on the w. The pretorium or general's quarter, now called Chapel hill, rises above the level of the camp, but is not exactly in the center, and is nearly a square of 60 ft. each side. Three of the four gates usual in Roman camps are still seen. A subterranean passage is said to have formerly extended from the pretorium under the bed of the Knaig. Not far n. of this station, on the way to Crieff, may be traced three temporary Roman camps of different sizes. Portions of the ramparts of these camps still exist. A mile w. of A., an immense cairn of stones lately existed, 182 ft. long, 45 ft. broad at the base, and 30 ft. in sloping height. A human skeleton, 7 ft. long, in a stone coffin, was found in it.

**ARDOYE**, a t. in Belgium, in the province of West Flanders, 17 m. s. from Bruges. Linen-bleaching is the principal branch of industry. Brewing and candle-making are also carried on. Pop. (including the commune, which is not large) 6500.

**ARDROSSAN**, a small seaport t. and summer bathing-place in Ayrshire. It owes its rise to the public spirit of the Eglintoun family. Its harbor, which is sheltered by an island off the coast, is one of the safest and most accessible on the w. coast of Scotland, and has been greatly improved, at vast expense, by the earls of Eglintoun. There is a large export of coal from this place, and shipbuilding is carried on to a considerable extent. On a hill above the t. stand the ruins of A. castle, said to have been surprised by Wallace when held by the forces of Edward I. Wallace destroyed the garrison, and threw the dead bodies into a dungeon called "Wallace's larder." Pop. in '71, 3845.

**ARE**, the unit of the French land-measure, is a square, the side of which is 10 meters (or 32·809 ft.) long (see **METER**), and which, therefore, contains 100 sq. meters = 1076 English sq. ft. The next denomination in the ascending scale is the *decaire*, containing 10 ares; but the denomination commonly used in describing a quantity of land is the *hectare* of 100 ares, = 2·47 English statute or imperial acres.

**AREA** (Lat.) is a term in mathematics meaning *quantity of surface*. The calculation of areas, or mensuration of surfaces, is one of the ultimate objects of geometry. The measuring unit is a square inch, a square foot, etc., according to the unit of length. As a figure is thus measured by finding an equivalent for its surface in *squares*, the process is sometimes called the *quadrature* of the figure.

**ARECA**, a genus of palms, containing several species, having pinnate leaves and double spathes. The fruit is a fibrous one-seeded drupe, a nut with an outer fibrous husk. *A. catechu*, the **PINANG PALM**, or betel-nut palm, is a native of the East Indies, whose nut yields a sort of catechu. See **CATECHU**. This areca-nut, or betel-nut, is very much used in all parts of the east, the chewing of it with quick-lime and the leaf of the betel-pepper being one of the most prevalent habits of the people. See **BETEL**. The nut is about the size of a hen's egg; the fibrous husk about half an inch thick. It is austere and astringent. It is doubtful if it possesses a narcotic power, or if this is to be ascribed entirely to the leaf which is used along with it. Areca-nuts form a considerable article of trade in the east. The timber of the palm which produces them, and its leaf-stalks and spathes, are also used for domestic purposes. The tree is often 40 or 50 ft. high, and in general less than a foot in diameter. The leaves are few, but very large, their leaflets more than a yard long. In Malabar, an inebriating lozenge is prepared from the sap. — *A. oleracea*, the **CABBAGE PALM** of the West Indies, is a very tall tree, 100 to 200 ft., whose huge terminal leaf-bud is sweet and nutritious, and is sometimes used for the table as cabbage, but when it is cut off, the tree is destroyed. The stem of this tree, notwithstanding its great height is remarkably slender. The nuts are produced in great numbers; they are about the size of a filbert, and have a sweet kernel. — *A. sapida*, the New Zealand palm, is remarkable as extending southward beyond the geographical limits of any other of its order, as far indeed as lat. 38° 22' s. It is a small palm, only from 6 to 10 ft. high, with leaves 4 to 6 ft. long. The young inflorescence is eaten. — *A. vestiaria*, a native of the east, is so called because clothing is made from its fibers.

**ARECIBO**, a t. of Puerto Rico, Spanish West Indies, on the n. coast of the island. It is the chief t. of a province of the same name. It has a considerable trade. Pop. 11,187.

**AREIOP'AGUS** (Gr. for "Mars' hill"), a mount lying to the w. of the acropolis, at Athens, and celebrated as the spot where the most venerable court of justice in ancient times held its sittings. It is not easy to determine satisfactorily why the hill obtained its name; most probably it was on account of sacrifices having been offered there at an early period to the god of war; but all its historic importance is derived from the Areiopagitic council, the origin of which reaches far back into antiquity, and is ascribed by some to the semi-mythological Cecrops. Orestes, according to tradition, was tried before this court, and it is certain that it must have existed long before the first Messenian war (740 B.C.), for the Messenians, in offering to submit to its decisions certain points of dispute, speak of it, even then, as "old." Solon, however, made many changes in its constitution, enlarging its sphere of jurisdiction to such an extent that it ceased to be any longer a mere criminal court, and acquired henceforth social and political powers in addition to the former. Before Solon's time it was strictly oligarchical. It now became a *tertium quid* between aristocracy and democracy, the new qualification for office introduced by Solon being *property* instead of *birth*. It thus naturally allied itself with aristocracy, so that we can perfectly understand why it should have been considered a check upon the impetuous democracy, though it would, perhaps, be fairer to regard it as a check upon both extremes. It is not known how many members were included in its council. The nine archons—if they had recommended themselves by a faithful discharge of their duties—were elected life-members of it. Solon made the council "overseers of everything," and we find instances of their manifold authority in the subsequent history of Greece. They granted money, at the time of the Persian invasion, from a reserve treasury of their own, the ordinary public treasury being empty. After the battle of Chaeroneia, they executed all who had deserted their country. In social mat-

ters, their powers appear to have been curiously minute. They had officers whom they sent or accompanied into private houses, on occasion of a festivity, to see that the rooms were not overcrowded; they called to account persons who lived in such riotous extravagance that their example might be considered hurtful to the community, and conferred marks of honor on those of an opposite character. Their sphere of influence seems to have extended itself to religion also. Innovations in the worship of the gods, neglect of the sacred ceremonies, impiety in any form, brought the offenders under the rebuke and punishment of the A. It is likewise asserted that they possessed and exercised great authority in the education of the young, although this statement, and that regarding some charitable functions attributed to them, are of dubious value.

Until the time of Pericles, the brilliant and powerful ruler of the democracy, the A. continued to maintain its ancient dignity. He soon discovered, however, that it would prove an insurmountable obstacle to the realization of his designs if not shorn of its privileges. After much and vigorous opposition, he succeeded in carrying a decree (458 B.C.), by which, as Aristotle says, the A. was "mutilated," and democratic tribunals acquired supreme authority. It is, however, far from being clear what were the precise changes which Pericles effected, whether he abridged its powers as a criminal, or as a social and political court. From the high estimation in which it was held for centuries after, in the first of these capacities, we are inclined to think that it was its social and political supremacy that was destroyed. Probably the A. was made responsible to the *demos*, or body of citizens. It lingered in life for a very long period. We hear of it as late as 380 A.D., and it would seem, from the case of St. Paul, that it possessed in his day a certain authority in religious matters.

**ARE'NA**, a part of an amphitheater (so called because it was usually strewn with sand, though when a fit of extravagance seized the Roman emperors, they used borax and cinnabar instead), where the combats of gladiators and wild beasts took place. It had four main entrances, and was surrounded by a wall about 15 ft. high, so that the spectators were perfectly safe. The name was afterwards applied by the Romans to any building for exhibitions of baiting animals, horsemanship, etc. On the continent, the name has been given to the large summer theaters for dramatic performances in the open air. It is applied also, in a general sense, to any scene of contest or display of power.

**ARENA'CEOUS ROCKS**. All rocks composed entirely, or to a large extent, of grains of siliceous, are included under this title. Beds of loose sand occur extensively in the more recent deposits. The grains, either of quartz or flint, are generally water-worn and rounded. In older deposits, the grains of sand are bound together by siliceous, calcareous, argillaceous, or ferruginous cements. It is seldom that a rock is composed of quartz materials alone; grains or particles of other mineral substances are frequently mingled with the grains of quartz. Silvery flakes of mica are seldom absent; and they often occur in layers parallel to the planes of stratification, causing the rock to split into thin slabs, and exposing a glittering surface. These are called *micaceous sandstones*. When grains of feldspar occur, it is a *feldspathic sandstone*. Often large quantities of calcareous matter, either as cement or as distinct grains, occur; and these are called *calcareous sandstones*. The presence of lime can always be detected by the effervescence which takes place on the application of muriatic or other acid. When the sandstone is coarse-grained, it is usually called *grit*. If the grains are large enough to be called pebbles, it becomes *conglomerate* or *puddingstone*; if the fragments are sharp and angular, it is called *breccia*.

**ARENA'RIA**, or SANDWORT, a genus of plants of the natural order *caryophyllea*, differing from *stellaria* (stitchwort, q.v.) chiefly in the undivided petals. The species are numerous, annual and perennial herbaceous plants of humble growth, rarely somewhat shrubby, natives of the temperate and colder parts of the world. Some of them are arctic and alpine plants. Many of them are chiefly found in sandy soils. The flowers are generally small and inconspicuous, but if closely examined, are seen to possess no little beauty. A number of species are natives of Britain.

**ARE'NDAL**, a t. on the s.e. coast of Norway, situated near the mouth of the Nid-elf in the bay of Christiania, with a pop. of 5800. It is built partly on poles, partly on rock, and this circumstance, as well as its situation, gives it a very romantic aspect. The bay, which is protected by the island of Tromøe, forms an excellent harbor, and favors the commerce of the town, which is considerable, in proportion to its size. A. is intersected by canals; its exports are iron from the neighboring mines, and wooden articles. Ship-building is also carried on; and on a smaller scale, distilleries and tobacco factories. King Louis Philippe, after the French revolution, when wandering in the north as duke of Orleans, made some stay here.

**ARENG'** or ARENGA. See GOMUTO PALM.

**ARENIC'OLA**. See ANNELIDA.

**AREOMETER** (*araios*, thin, and *metreō*, I measure; Fr. *aréomètre* or *pèse-liqueur*; Ger. *Aräometer* or *Senkwaage*), called also hydrometer, an instrument which is allowed to float freely in liquids, to determine their specific gravity or that of solid bodies. By specific gravity (q.v.) is meant the ratio that the weight of any volume of a substance bears to the weight of the same volume of water. Thus, a cubic foot of alcohol weighs 793

ozs., while the same quantity of water weighs 1600 ozs.; the specific gravity of alcohol is set down, therefore, as  $\frac{793}{1000}$  or .793. A cubic foot of sulphuric acid weighs 1841 ozs., and has, consequently, a specific gravity of 1.841. These relations are not confined to the particular volume, one cubic foot, of these bodies, but hold for any equal volumes of them. Equal volumes of alcohol, water, and sulphuric acid, have always to each other the ratio respectively of 793, 1000, and 1841; and this is only an instance of the general principle, that equal volumes of different substances have weights bearing to each other the direct ratio of the specific gravities of these substances. This is the principle on which areometers with weights, or weight-areometers, are constructed. If, however, equal weights of any two of these liquids were taken, it would be found that .793 of a cubic foot of water would weigh as much as 1.000 cubic foot of alcohol; 1.000 cubic foot of sulphuric acid as much as 1.841 cubic ft. of water; or .793 of a cubic foot of sulphuric acid as much as 1.841 cubic ft. of alcohol; more generally thus—when equal weights of two different fluids are taken, the volumes of each are inversely as their specific gravities. On this latter principle depends the use of areometers with scales, or scale-areometers. The scale-A. is much more commonly employed than the weight-A., and is, in consequence, a much more important instrument. Of the various forms of scale-areometers, that contrived by Gay-Lussac deserves particular notice, from the simplicity of the mode of graduation; and an account of it will give the best idea of the general nature of such instruments. Fig. 1 gives a representation of it. It consists of a uniform glass tube, AB, blown into two bulbs C and D, at the bottom. The lower bulb, D, is loaded with mercury, so that when the instrument floats in any liquid, the stem, AB, is maintained in a vertical position. We shall suppose that the quantity of mercury is so adjusted that when placed in water, the A. sinks to the point W, which may, in consequence, be called the water-point. According to the principle of Archimedes, the weight of the volume of water displaced by the instrument up to this point is equal to the weight of the instrument. Let us suppose, for the sake of simplicity, that the water so displaced is a cubic inch, the weight of the A. will be that of a cubic inch of water, or 250 grains (more correctly 252.5 grains at 60° F.). If the A. be now placed in a fluid heavier than water, such as a mixture of sulphuric

Areometers.

acid and water, having a specific gravity  $\frac{5}{4}$  or 1.25, it is manifest that if it is sunk again to the water-point, the displaced fluid would weigh  $\frac{5}{4}$  of 250 = 312½ grains, or 62½ grains more than the weight of the instrument. As much, therefore, of the stem of the A. must rise above the liquid as will reduce the weight of the displaced liquid to 250 grains, or reduce the volume to  $\frac{4}{5}$  of what it was before. If the stem in this case rises to B, the volume displaced by the part WB is  $\frac{1}{5}$  of the volume displaced by the instrument at the water-point. If we consider the whole divided into 100 parts, and mark 100 at W, B must be marked 80, as the A. displaces up to that point  $\frac{4}{5}$  of 100; and if the intervening space on the stem be divided into 20 equal parts, each of them will correspond with  $\frac{1}{100}$  of the water-volume—viz., .01 of a cubic inch, or with  $\frac{1}{100}$  of the weight of the instrument—viz., 2.5 grains. If the same scale be carried above the point W, and the divisions marked as ascending from 100, the A. will be serviceable likewise for fluids less dense than water, and will mark the volumes which it displaces in each of them. The A. thus graduated gives immediately the volumes which it displaces in different liquids; and from these, seeing that it displaces in every case a weight of liquid equal to its own, the specific gravities may be calculated according to the principle already stated—viz., that equal weights of two different fluids have volumes inversely as their specific gravities. If, in a mixture of sulphuric acid and water, the A. stands at 90, according to the above principle, 90 volumes of the mixture weigh as much as 100 of water; therefore, its specific gravity is  $\frac{100}{90}$  or  $1\frac{1}{9}$ . If, again, in a mixture of spirits and water, it should stand at 110, 110 volumes of the mixture weigh as much as 100 of water, so that its specific gravity is  $\frac{100}{110}$ , or  $\frac{10}{11}$ . In all cases, then, 100 is to be divided by the number read on the A., to determine the specific gravity of the liquid in which it floats.

The delicacy of the A. depends on the distance of the divisions on the scale, or on the thinness of the stem compared with the bulbs. An instrument possessing this advantage cannot be made to serve both for liquids heavier and lighter than water, for the stem would be of an inconvenient length; and it is usual to construct two areometers—

one marked with the water-point at the top, and the scale descending to 50, for fluids heavier than water; and the other, with the water-point at the bottom, and the scale ascending to 150 for fluids lighter than water. The scale is generally marked on a slip of paper, which is fixed inside the stem. Gay-Lussac's A. is also known under the name of "volumometer." Although it cannot be surpassed either for accuracy or simplicity, it is much less used than other instruments of a similar nature furnished with arbitrary scales requiring the aid of tables to interpret the readings. The best known of these is Twaddle's A., used in England; and Beaumé's A., extensively adopted on the continent. The A. with an equally-divided scale is a very ancient instrument; it was known among the Greeks under the name of "baryllion." On some areometers the divisions are not at equal distances, but are so drawn as to give at once, without table or calculation, the specific gravity of the fluid in which they are placed. Although very desirable, in practice they do not possess the accuracy of the A. with equally-divided scales, because the graduation of them is attended with considerable difficulty.

No form of A. can be made to determine specific gravities with perfect accuracy, and such instruments are only useful where a ready and good approximation is all that is needed. They are, in consequence, employed chiefly to ascertain the specific gravity of the various liquors and solutions which occur in the arts and manufactures, and very frequently they are graduated with reference to special liquids, as spirits, wine, milk, brine, etc. The alcoholometer or hydrometer of Sikes is an instrument of this latter description, and is in general use in the excise for estimating the strength of spirits. It is represented in Fig. 2. BC is a hollow brass ball, surmounted by a flat stem AB, and loaded below by a short conical stem CD, terminated by the pear-shaped bulb D. It is accompanied by eight weights, by which the weight of the instrument may be increased, and the range of the scale extended to fluids heavier as well as lighter than water. One of these weights, W, is shown in the figure; it is furnished with a slit, so as to allow of it being slipped on to the narrowest part C, of the lower stem. The stem, AB, is graduated into 11 equal parts, and these again into halves; and the instrument is so adjusted that its indications give the volumes of water that must be added to or taken from 100 volumes of the mixture under examination to reduce it to proof-spirit (see ALCOHOL), which is a mixture of nearly equal parts of water and alcohol. Thus, if the A. indicates 11 over-proof, 11 volumes of water must be added in order to bring the liquid down to proof-strength; and 100 gallons of such strength would be reckoned as 111; 100 gallons, at 11 under-proof, would in the same way be charged as 89. Very carefully-constructed tables accompany the instrument, in which the specific gravity and percentage of alcohol of different mixtures, at different temperatures, are marked, corresponding to each degree of the A. Since the specific gravity of alcohol is known, it might be thought that if that of a mixture of it with water were known, the relative proportions of each would also be known. Such, however, is not the case, for alcohol and water possess a chemical affinity for each other, which causes the combined volumes of the two to measure less than the two volumes separately. Thus, 50 volumes of alcohol mixed with 50 volumes of water does not make 100 volumes of the mixture, but only 96, and thereby the specific gravity of the mixture is higher than it would have been if no contraction had taken place. As the law of this contraction is very complicated, the relative proportions of the two in a combination of given specific gravity are only to be estimated from tables founded upon experimental data.

The peculiar feature of areometers with weights is, that instead of a scale, they have only one mark on the stem, to which the A. is in all cases sunk. One of the best-known instruments of this kind is the A. of Nicholson. It consists of a brass tube, BC (fig. 3), about 1 in. in diameter, closed above and below by conical ends, to the upper of which a wire is fixed, carrying on the top of it a cup A, capable of containing the weights; and to the lower a hook is attached, from which hangs the cup D. The lower part of the cup, D, is also provided with a hook, and the whole instrument is kept vertical, partly by the weight of the cup, and partly by the weight of the ball, E, suspended from it. On the wire, a notch, W, is made, to serve as the mark or fixed point to which the A. is sunk. The specific gravities of liquids are determined by Nicholson's A. in the following way: The weight of the A. itself is first ascertained—let it be in a given case 2000 grains—it is then put into water at the temperature of 60° F., and weights (say 500 grains) put in, till it is sunk to W. It is now removed to the liquid under examination; and if the weight required to sink the instrument now to the standard-point be only 100 grains, we have the specific gravity of the liquid equal to  $\frac{2000}{2100}$ , or  $\frac{20}{21}$ . In both fluids the same volume has been displaced, and that is in each case equal to the weight of the A.; but the weight of the A. in the second case was  $2000 + 100$ , and in the former,  $2000 + 500$ ; hence the above result. Nicholson's A. is seldom used for finding the specific gravity of fluids; its use is almost entirely restricted to ascertaining that of small solid substances, as gems and small pieces of minerals. The following example will show how this is done: If in the cup of the A. already mentioned, when placed in water, the gem be put, and only 440 grains be then necessary to bring the instrument to W, 60 grains is manifestly the weight of the gem, because 500 grains were needed without it to do the same thing. The gem is next placed in the lower cup, D, and if 460 grains are now needed to sink to the standard-

point, the gem has thus lost 20 grains of its weight by being immersed in the water. According to the principle of Archimedes (q.v.), these 20 grains are also the weight of a volume of water equal to that of the gem; so the specific gravity of the gem is  $\frac{20}{3}$ , or 3. By reversing the cup D, which is furnished with perforations to allow free passage to the air, and attaching the weight, E, to the handle of it, the specific gravity of substances lighter than water may also be determined by this instrument. The other forms of weight-areometers are those of Fahrenheit, Tralles, and Charles. For the more accurate determination of the specific gravities of liquids and solids, see SPECIFIC GRAVITY.

AREOPAGUS. See AREIOPAGUS, *ante*.

**AREQUIPA**, a term primarily applied to a mountain in the west Cordillera of the Peruvian Andes, and secondarily to a city at its foot, being from this, again, extended to a district, a province, a department, and a diocese. 1. The city, which is in lat. 16° 13' s., and in long. 72° 18' w., is the third largest in Peru, being inferior only to Lima and Cuzco, and is said to contain 35,000 inhabitants. It carries on a considerable trade both with the interior and by sea. Its port is Islay, one of the larger harbors of the republic. 2. The department is bounded n. by Lima; e. by Ayacucho, Cuzco, and Puno; s. by Moquega, which, along with it, forms the diocese; and w. by the Pacific. It contains 200,000 inhabitants, and is subdivided into seven provinces. Like nearly the whole of the maritime region of Peru, it is generally arid and sterile. 3. The mountain is volcanic, of the form of a truncated cone, and of the height of 20,330 feet. Its neighborhood is subject to earthquakes.

ARÉS. See MARS.

**ARETÆUS**, a famous physician of Cappadocia, who flourished in the latter half of the 1st, and in the beginning of the 2d c. after Christ. He is considered to rank next to Hippocrates in the skill with which he treated diseases; but he did not, in every instance, follow the practice of the "father of medicine." He was less attentive to "the natural actions" of the system, which he frequently counteracted, if he thought it desirable; administered active purgatives copiously, employed narcotics, and did not object to bleeding. He was, in fact, noted for his total want of professional bigotry; and hence, not committing himself to any particular set of opinions, in his accuracy in the detail of symptoms and the diagnosis of disease, he is superior to most of the ancient physicians. His great work, written in singularly elegant and concise Ionic Greek, is divided into two parts. The first four books treat of the causes and symptoms of acute and chronic diseases; the second, the cure of the same. They are almost in a state of complete preservation, and have been translated into various European languages, besides having been frequently edited in the original. The finest edition is the Oxford one of 1723, by J. Wigan; a German translation appeared at Vienna (1790-1802), and an English by T. F. Reynolds, London, 1837.

ARETHUSA. See ALPHEIUS.

**ARETINIAN SYLLABLES** are the syllables *ut, re, mi, fa, sol, la*, used by Guido d'Arezzo for his system of hexachords.

ARETINO, GUIDO, or GUIDO D'AREZZO. See GUIDO ARETINO, *ante*.

**ARETINO**, PIETRO, an Italian author of the 16th c., was the natural son of a gentleman named Luigi Bacci, and was b. at Arezzo, in Tuscany, on the 20th of Mar., 1492. Banished from his native town, he went to Perugia, where he wrought as a bookbinder, and gathered up a few scraps of learning, until, seized with a desire of becoming famous, he abandoned his occupation, and wandered through Italy in the service of various noblemen. At Rome, he distinguished himself by his wit, impudence, and talents, and secured even the papal patronage, which, however, he subsequently lost by writing licentious sonnets. A. now went to the Medicean court, where John de' Medici grew so fond of him that he shared his bed with the adventurer, and even procured him an opportunity of ingratiating himself with Francis I. at Milan in 1524. A few years later, he settled at Venice, where he also acquired powerful friends. The bishop of Vicenza not only soothed the irritation of the pope against A., but also recommended him to the emperor Charles V. The latter, as well as his chivalrous rival, Francis, and other great persons, pensioned the fortunate wit, besides enriching him with splendid presents. He likewise obtained considerable sums for his literary efforts.

Nature had undoubtedly gifted A. with some fine qualities, but these were vitiated by his love of sensual gratifications. His death in 1556 accorded with the character of his life. It is said that while laughing heartily at some trifling adventure of one of his abandoned sisters, he fell from a stool, and was killed on the spot. His poetical works include five comedies and a tragedy. The former are full of wit and genuine comic humor; the latter is not without merit. His *Sonetti Lussuriosi* have been translated into French, under the title of *Académie des Dames*. Besides these, he wrote a number of other pieces, some of which have not been published. His satire procured for him the name of "the scourge of princes;" but it seems clear that he was equally well fitted to be their sycophant. Although the very impersonation of licentiousness, he had nevertheless the impudence to publish some books of a devotional kind, with the view of obtaining the favor of the pope.

**ARETINO**, SPINELLO, an early Italian painter of great genius, was b. at Arezzo in 1316, or, according to others, in 1328. He studied under Jacopo del Casentino; but before he had attained his majority, he had surpassed his master in the vigor and liveliness both of his conceptions and coloring. His reputation attained its full bloom after he went to Florence, where he painted in fresco, in the chapel of St. Maria Maggiore, several incidents in the life of the Virgin and of St. Antonio Abate. The monastery of San Miniato, near Florence, contains to the present day a few of his frescos. He also adorned the monasteries of San Bernardo at Arezzo and Monte Oliveto near Florence. Vasari thought that the finest works of A. were those which he executed for the Campo Santo at Pisa, illustrating the life of San Ranieri. Of these, however, we have only prints, and cannot therefore judge satisfactorily. His principal works, still remaining, are those from the life of pope Alexander III. in the town-hall of Siena. He d. in 1408.

Throughout all Italy, A. was greatly admired for his invention, the grace and simplicity with which he arranged his figures, and the finish of his style. His Madonnas possessed a remarkable sweetness of expression; and his coloring was in most cases bold and beautiful. Vasari prefers him to Giotto.

**AREZZO** (ARETUM), the chief city of the Italian province of A., is situated in a fertile valley near the confluence of the Chiana with the Arno, lat. 43° 27' n., long. 11° 52' e. It is 38 m. e.s.e. from Florence. A. is perhaps the oldest town in Tuscany, and formed one of the 12 cities of the ancient Etruscans. It was devastated by Sylla during the social war; and, like many other Italian cities, was sacked by the Goths when they burst into the peninsula. During the contest of the Guelphs and Ghibellines, in a later age, it became subject to Florence, whose troops defeated those of A. at the battle of Camaldino, in which the poet Dante took part. Arezzo contained (1871) 11,154 inhabitants; but its extensive walls and numerous churches bear record of its more flourishing and more populous period. The *Piazza Grande*, the *Pieve*, an old church founded on the site of a heathen temple, and the cathedral, which, like almost all the other churches, has an unfinished façade, are its principal public buildings. The cathedral has a splendid high altar in marble by Giovanni Pisano; and the several churches contain fine specimens of the old Tuscan school of painting. These ecclesiastical decorations are contrasted with the general aspect of the city, which has dark and dirty streets. Its industry is at present at a very low ebb, there being few or no manufactures, and its people are not generally favorites in Italy; but perhaps no city of its size ever produced a greater number of celebrated men, among whom may be mentioned—Mæcenas, the famous patron of letters in the time of the emperor Augustus; Petrarck; Pietro Aretino; Guido de A., inventor of the gamut; Leonardo de A., the historian; Cesalpino, the botanist; Redi, the physician; pope Julius III.; the notorious marshal d'Ancre; and Vasari, author of *Lives of the Painters*. Michael Angelo was also born in the vicinity of A. The province of A. contains 1276 sq. m., with a pop. of (1871) 234,645. The soil is fertile in corn, wine, and oil.

**ARGÆUS**, MOUNT (Arjis Dag), the highest point in Asia Minor, a little over 13,000 ft., which is nearly 3000 ft. above the line of perpetual snow. On the s. it connects with the Taurus mountains.

**ARGALA**. See ADJUTANT.

**ARGALI**, *Ovis Ammon*, the great wild sheep of Siberia and central Asia. It is found from Kamchatka to the Himalaya mountains, where, however, it is only seen in the more elevated regions. "We came suddenly," says Dr. Hooker in his *Himalayan Journal*, "upon a flock of gigantic wild sheep, feeding on scanty tufts of dried sedge and grass; there were 25 of these enormous animals, of whose dimensions the term sheep gives no idea; they are very long-legged, stand as high as a calf, and have immense horns, so large that the fox is said to take up his abode in their hollows when detached and bleaching on the barren mountains of Tibet." The horns of the male are nearly 4 ft. long, and 14 in. in circumference at the base, where they are triangular. The general color is fulvous gray, white beneath, with a whitish disk around the tail. The wool is concealed by hair. The name A. is Mongolian, and was adopted by Pallas. A similar but smaller species is also found on the Himalaya mountains. The Rocky mountain sheep, or bighorn, is sometimes called the American A. See SHEEP.

**ARGALL**, Sir SAMUEL, 1572-1639; one of the early colonists of Virginia. He became famous for carrying off the more famous Pocahontas, daughter of the Indian chief Powhatan, and presenting her to the government of the colony as a slave. A., it is said, bought the girl from the Indian having charge of her, for a brass kettle. In 1613 A. broke up the French settlement at Mt. Desert, Me., and the act was the cause of war between the English and French colonists, in which the settlements of the latter at Port Royal and St. Croix were destroyed. In 1617 he became deputy governor of Virginia, where he violated the established laws, and made others to favor illegal trade in which he had the earl of Warwick for a partner. Instead of being punished he was shielded by his powerful partner, both acquiring immense wealth, to which A. made large additions by robbing the estate of lord Delaware, of which he was administrator. He was captain in the expedition against the Algerines in 1620, was knighted the next year by James I., and in 1625 was in Cecil's expedition against the Spaniards.

**ARGAN**, *Argania sideroxyylon*, *sideroxyylon spinosum* of Linnæus, a low spiny ever-green tree of the natural order *sapotacea*, a native of the southern parts of the kingdom of Morocco, bearing an ovate drupe about the size of a plum, dotted with white, and full of a white milky juice. The Moors extract an oil from the fruit, which they use with their food.

**ARGAND**, **AIMÉ**, physician and chemist, was born at Geneva about the middle of the 18th century. He was the inventor of the well-known *argand lamp*. The chief difficulties that attended the use of lamps as a source of light were—first, in procuring the complete combustion of the oil, so as to keep the flame from smoking; and second, in preventing the level of the oil in the reservoir from sinking as the combustion goes on. The round cotton-wick, used in the old simple form of lamp, was always attended with smoke and smell. The oils and fats are exceedingly rich in carbon, containing 70 to 80 per cent of that element, and only 10 to 13 of hydrogen. The round thick column, then, of oil-vapor rising from the wick of an old-fashioned lamp, presented too little extent of surface to the air; the oxygen of all the air that could get access was chiefly taken up in burning the hydrogen, and a large proportion of the carbon ascended in the burnt air as smoke. A's improvement was that he made the wick in the form of a ring. The flame thus became a hollow cylinder with a current of air ascending through the inside, so that the burning surface was doubled. It would appear, however, that the

**Argand Burner.** lamp did not satisfy the expectations of A., till his younger brother accidentally discovered the effect of a glass cylinder, as a chimney over the flame, by which the flame was steadied, a draught created, and the greatest possible amount of light yielded.

A. was soon involved in a dispute with one Langé of Paris regarding the originality of his invention. He went thither to vindicate his claim, but rather than risk the chances of a lawsuit, he consented to share the honor, and a patent was obtained by which Langé and A. alone were authorized to make and sell the new lamps in France for 15 years. The French revolution, however, destroyed their privilege, and A. retired to England. After some time, he returned to his native country, a victim to melancholy and fantastic humors, and d. on the 24th Oct., 1803.

**ARGAUM'**, a village in the territory of the Nizam. It is in lat.  $21^{\circ} 2' \text{ n.}$ , and in long.  $77^{\circ} 2' \text{ e.}$ , on the route between Ellichpore and Aurangabad. Its single claim to notice is that, on 28th Nov., 1803, about two months after the battle of Assaye, major-gen. Wellesley here gained another victory over the Mahrattas. To commemorate this action, a medal was struck in 1851, about a year before the death of the illustrious conqueror.

**ARG'EL**, or **ARGHEL**, *Solenostemma A.*, or *Cynanchum A.*, a plant of the natural order *asclepiadacea*, a native of Arabia and of the north of Africa, deserving of notice only because of the frequent use of its leaves for the adulteration of senna. They are lanceolate and leathery, and may readily be distinguished from genuine senna leaves by their texture, their being downy, their greater heaviness, the comparative absence of veins, and the symmetry of their sides, the sides of the true senna leaves being unequal. They are acrid, and cause sickness and griping, but a difference of opinion subsists as to their possessing purgative properties.

**ARGELANDER**, **FRIEDRICH WILHELM AUGUST**, one of the most eminent astronomers of our time, was b. Mar. 22, 1799, at Memel. He studied at Königsberg, where the science of finance first attracted him; but he was subsequently drawn away to that of astronomy by the lectures of Bessel, by whom he was employed to make calculations and observations. In 1820, he was appointed assistant to Bessel in the Königsberg observatory, and in 1823 succeeded Walbeck as astronomer at the observatory of Abo, in Finland. Here he commenced a series of observations on the fixed stars which have a perceptible "proper motion." His studies were unfortunately interrupted by a fire which destroyed the observatory; but after a time, he resumed them in a new observatory at Helsingfors, and published a catalogue of not less than 560 stars having "proper motions." This contained the results of his observations at Abo, and received from the academy of St. Petersburg the great Demidov prize. After removing to the university of Bonn in 1837, A. published his *Uranometria Nova* (Berlin, 1843), containing celestial charts of the fixed stars seen in our hemisphere with the naked eye; also (in 1846) his *Astronomical Observations*, containing the results of an examination of the northern heavens from  $45^{\circ}$  to  $80^{\circ}$  declination. His *Atlas of the Heavens* will combine with these works to perpetuate his memory. A. was long engaged in a series of observations on the changes of light in variable stars, and he also demonstrated the theory that there is a progressive motion of the solar system in space. He d. in 1875.

**ARGEMONE**, a genus of plants of the natural order *papaveraceæ*, distinguished by 4 to 6 petals, 4 to 7 radiating concave stigmas, and an obovate capsule, opening by valves at the point. *A. Mexicana*, sometimes called Mexican poppy, is an annual herbaceous plant with large yellow flowers, and sessile, waved and sinuated, spiny leaves, variegated with white. It is a native of Mexico and of the southern parts of the United States, and is now also common in many tropical and sub-tropical countries, in which it has been naturalized. Its seeds are narcotic, purgative, and diuretic, exhibiting in

a strong degree those qualities of the order of which the seeds of the poppy are devoid. They are used in the West Indies as a substitute for ipecacuanha, also instead of opium; and the juice of the plant is employed as a remedy for ophthalmia.—This plant is not unfrequently to be seen in flower-borders in Britain; but in the northern parts, at least, the seed is generally sown in a hot-bed.

**ARGENS, JEAN BAPTISTE DE BOYER, Marquis d'**, b. at Aix, in Provence, June 24, 1704. He was originally intended for a learned career; but, from a love of adventure, he entered the army at 15. Fascinated by a certain actress, he eloped with her to Spain, but was captured, and brought back to Provence. In spite of his glaring breach of discipline, he had the good-fortune to be employed in the French embassy to Constantinople, and on his return, re-entered the army. Being disabled by accidents in military service, and disinherited by his father, he tried his fortune in authorship, and by his *Lettres Juives*, *Lettres Chinoises*, *Lettres Cabalistiques*, and *La Philosophie du Bon Sens* (London, 1737), attracted the notice of Frederick II., then crown-prince of Prussia, and became a favorite at the court of Prussia when Frederick came to the throne. The king appointed him chamberlain, and a director of the art academy at Berlin, with a salary of 6000 livres. He was a constant associate of Frederick, who liked exceedingly his frank and vivacious character, but used to tease him on account of his hypochondriacal fits. When almost a sexagenarian, he renewed the adventures of his youth by again falling a victim to the charms of an actress, Mademoiselle Cochois, whom he married without Frederick's permission. This and other circumstances irritated the despotic monarch, who deprived A. of his pension. The latter now returned to Provence, and d. at Toulon, Jan. 11, 1771. His numerous writings, but especially his *Histoire de l'Esprit Humain*, *Lettres et Mémoires*, and those above mentioned, once enjoyed a considerable reputation.

**ARGEN SCLA, LUPERCIO and BARTOLOMÉ LEONARDO DE**, two of the first among the Spanish poets in the "golden age," were b. at Barbastro, in Aragon; the former in 1565, the latter in 1566. They studied at the university of Huesca. Lupercio afterwards went to Madrid, while Bartolomé entered the church. In character and fortune, however, they were closely united throughout the whole of their career. Both were patronized by Marie of Austria, who appointed the one her chaplain, and the other her private secretary. The latter was subsequently made chamberlain to the archduke Albert of Austria, and Philip III. appointed him historiographer of Aragon. Bartolomé was employed by the count de Lemos to edit the *Conquista de las Molucas* (Madrid, 1609); and when this nobleman was appointed as viceroy of Naples, both the brothers A., who had acquired fame as poets, attended his court at Naples, where Lupercio, who then filled the office of secretary of state, died in 1613. Bartolomé returned to Spain with the viceroy in 1616, and occupied the position formerly held by his brother, as historiographer of the kingdom of Aragon, where he proceeded with the work left unfinished by Lupercio—a continuation of Zurita's *Annals of Aragon*. While engaged in this work, he d. Feb. 26, 1631. The collected poems of the two brothers were first published in 1634, by the son of Lupercio, and passed through several editions. These poems (*Rimas*) consist of epistles, odes, sonnets, and satires, and are singularly alike in character. They are imitative of the style of the Latin poets (especially Horace, for which reason the brothers have been styled "the Spanish Horaces"), and display more care and polish than originality of invention or richness of fancy. Bartolomé A., as a prose-writer, is reckoned among the Spanish classics. The style of his continuation of Zurita is a great advance on the original, especially in correctness.

**ARGENSON, MARC ANTOINE RENÉ DE PALMY, D'**, 1722–87; a French diplomat and author, son of Louis XVth's minister of foreign affairs. He was envoy to Poland, Switzerland, and Venice; a member of the royal academy, and is gratefully remembered for the princely donation of 150,000 volumes to its library. He was editor of 40 volumes of the *Universal Bibliography of Romance*, in which are some novels of his own.

**ARGENSON, MARC PIERRE, Comte d'**, a celebrated French statesman, was b. in 1696. After holding a number of inferior offices, he succeeded M. de Breteuil as secretary of state to the war minister in 1742. On the death of cardinal Fleury, in the following year, the whole care of the war then raging devolved upon him. He found matters in the most deplorable condition. The French troops, decimated by sword and disease, were in full retreat across the Rhine; the Austrians already swarmed in Alsace and Lorraine, and the very political existence of France was imperiled; but A., by his vigor and lucky choice of generals, changed the fortunes of the war in the course of one year. After the victories of Fontenoy and Lawfeldt, and the capture of Bergen-op-Zoom peace was secured by the famous treaty of Aix-la-Chapelle, signed in 1748. A., however, did not remain inactive, he established the *Ecole Militaire* in 1751, and, by various measures, kept alive the military spirit of the nation. He was an illustrious patron of literature. Diderot and D'Alembert dedicated to him their great *Encyclopédie*; and to Voltaire, whose fellow-student he had been, he furnished materials for his *Siècle de Louis XIV.* In 1756, he was exiled to his estate, it is supposed by the machinations of Madame Pompadour. On her death he returned to Paris, where he d. in 1764.

**ARGENSON, MARC RENÉ D'**, 1771–1842; a French soldier and statesman. He served as Lafayette's adjutant, and took part in the expulsion of the English from Walcheren. In 1809, he was prefect of Antwerp (then Deux-Nèthes), but resigned rather

than confiscate the property of the mayor at the order of the French ministry. He was elected deputy for Belfort in "the hundred days," and re-elected after the second restoration. In 1830 he appeared in the chamber to represent Strasburg, and in 1832 was one of the members who signed the *compte rendu*. The next year he put his name to the manifesto of the "Society of the Rights of Man." He was a prominent member of the Carbonari, and was to be dictator in case the expected revolution should succeed.

**ARG'ENT**, the French word for silver, is always used in English heraldry to signify that metal. In engraving shields it is left white.

**ARGENTA**, a t. of central Italy, in the province of Ferrara, and 18 m. s.e. from Ferrara, on the Reno, in the plain near the marshes of Comacchio. Pop. of commune, 15,926.

**ARGENTAN**, a t. of France, department of Orne, and chief t. of the arrondissement of the same name. It has an ancient castle, manufactures of linen and lace, and bleach-fields. Pop. '76, 5254.

**ARGENTEUIL**, a co. in Canada, on the Ottawa river, 850 sq. m.; pop. '71, 12,806. The soil is good, and there are valuable deposits of bair (burr) stone. Principal t., Lachute.

**ARGENTEUIL**, a t. of France, in the department of the Seine-et-Oise. Its priory, now in ruins, was founded in the 7th c., and was by Charlemagne turned into a nunnery, of which the famous Heloise became abbess. Pop. of A. (1876), 7934.

**ARGENT'EUS CODEX**. See **ULFILAS**.

**ARGENTINE**, *Argentina*, a genus of small fishes of the family *salmonidae*, of which one is rarely found on the British shores, and two or three are found in the Mediterranean. They are chiefly remarkable for the resplendent silvery lustre of their sides, and the abundance of *nacre*, the substance used in making artificial pearls, with which their air-bladder is externally loaded. It consists of a coat of silvery fibers. Upon account of it, they are sought after. They are commonly taken in nets along with anchovies or sardines.

**ARGENTINE CONFEDERATION**. Under the constitution of the A. C., the executive power is in a president elected once in six years by the 133 representatives of the 14 provinces. The legislative authority is in a national congress, consisting of a senate of 28 members, two from each province, and a house of deputies of 50 members. The government is modeled after that of the United States in nearly all particulars. The governors of the provinces are elected by the people. The public revenue is mainly from customs or duties, which are very heavy. For 1876 the receipts were \$13,040,285, and the expenditures \$25,279,520. The public debt at the close of 1877 was \$40,621,700. At the end of 1876 the army numbered 12,393 men, besides which there was a national guard of 19,867 men. The navy consisted of 26 steamers of all sizes, carrying 78 guns. There were, Jan. 1, 1878, ten railroads in operation, with a total length of 1409 m.; besides 1568 m. in prospect, sanctioned by the government, including an international line, 864 m. long, from Buenos Ayres to Chili. At the end of June, 1877, there were 4820 m. of telegraph in operation, with 9880 m. of wire. About 70 per cent of the lines are under government control, and 30 per cent in private hands. See **ARGENTINE REPUBLIC**, *ante*.

**ARGENTINE REPUBLIC**, the confederation of the Rio de la Plata, or River of Silver, South America—the Latinized epithet and the Spanish term being merely copy and original of one and the same misnomer. Lat. 22° 30' to 41° s., long. 54° to 70° 31' w. This confederation, as constituted by its reunion with Buenos Ayres in 1859, consists of what may be roughly termed a rectangle comprising 19° of lat. and 18° of long. On the w. it is bounded by the Andes, which separate it from Chili and the desert of Atacama; on the n. by Bolivia; by Paraguay, Brazil, Uruguay, and the Atlantic on the e.; and on the s. by Patagonia. The republic embraces 14 provinces, divided into 173 departments. The following table is compiled from the census of 1869:

PROVINCES.	Depart- ment.	Area in sq. miles.	Popu- lation.	CHIEF TOWNS.	Popu- lation.
1. Buenos Ayres.....	51	83,615	495,107	Buenos Ayres.....	177,787
2. Santa Fé.....	4	25,087	89,117	Santa Fé.....	10,670
3. Entre Ríos.....	10	29,955	134,271	Concepcion.....	6,531
4. Corrientes.....	17	45,454	129,023	Corrientes.....	11,218
5. Cordova.....	14	58,997	210,508	Cordova.....	28,523
6. San-Luis.....	8	24,151	53,294	San-Luis.....	3,748
7. Santiago.....	8	33,799	132,898	Santiago.....	7,775
8. Mendoza.....	8	30,699	65,413	Mendoza.....	8,124
9. San-Juan.....	4	18,772	60,319	San-Juan.....	8,353
10. Rioja.....	7	31,103	48,746	Rioja.....	4,489
11. Catamarca.....	8	35,780	79,962	Catamarca.....	5,718
12. Tucuman.....	9	23,286	108,953	Tucuman.....	17,438
13. Salta.....	16	63,461	88,933	Salta.....	11,716
14. Jujuy.....	9	33,527	40,379	Jujuy.....	3,071
Total.....	173	542,786	1,736,923		

Foreigners—of whom there were reckoned to be about 200,000 in the republic, consisting of Americans, Italians, Spaniards, French, English, Swiss, Germans, and others—are included in these numbers. The A. R. claims, besides the provinces enumerated, the desert of Gran Chaco in the n.; and that which, in the s., lies between the Rio Colorado and the Rio Negro; Patagonia is also within the region to which it asserts a right. These wide and wild domains, however, have been hitherto sources rather of disquiet than desirable acquisitions, as the Indians occasionally commit inroads upon the settled provinces.

Except the most purely Indian districts to the west of Buenos Ayres, the provinces of the A. R. lie chiefly in the basin of the Rio de La Plata, embracing much the larger half of the same. Mountains abound in the n.w.; and elevated ranges are found also in Entre Rios, which is situated, as its name implies, between the Parana and the Uruguay. But, with these exceptions, nearly the whole country presents boundless plains, covered alternately with rich pasturage and gigantic thistles. The climate and productions vary considerably—being tropical and temperate respectively to the n. and s. of Corrientes (in 27° 27' n. lat.). Agriculture, however, of every description is very backward—less, perhaps, than  $\frac{1}{100}$  of the surface being under cultivation. The rearing, in fact, of live-stock is the grand business of the country. Millions of cattle wander at will across the plains, or are kept on breeding-estates of vast extent; and likewise of mules and horses there are immense bands. Besides the Rio de La Plata, which is rather an estuary than a river, and its far-reaching affluents, the hydrography of the A. R., comprises the head-waters of some southern streams, which fall into the open Atlantic, such as the Rio Colorado, the Rio Negro, etc.; and along the w. border, under the shadow, as it were, of the Andes, salt lakes are common. In connection, doubtless, with this feature in the hydrography, mines of rock-salt exist, and salt here and there abundantly encrusts the plains, both to the satisfaction and benefit of the roaming herds. The names of the country and its estuary are, as already characterized, to a great extent, misnomers, yet silver ore, gold, copper, sulphur, coal, and alum have been found near the Andes. Little mining has yet been done. The export trade, chiefly in hides and wool, is increasing, and there are several lines of railway.

In 1515, Juan Diaz da Solis, while searching for a passage into the Great South sea newly seen by Balboa, entered the Rio de la Plata. In 1526, Sebastian Cabot, son of the discoverer of Newfoundland, penetrated nearly to the confluence of the Parana and the Paraguay, being arrested by the rapids, which afterwards gave name to Corrientes. In 1535, Buenos Ayres was founded, to command, though indirectly, the most practicable channel of the only outlet of the country, a city which, in conjunction with its own colony of Montevideo, on the opposite bank, has virtually monopolized the history of a region equal in extent to western Europe. Gradually other cities were planted, partly by colonists from Spain, and partly by adventurers from Peru, each city generally giving its own name to its own province. The chief staples of the country—horses and cattle—had been largely introduced before 1552. Down to 1775, the basin of the Rio de la Plata was a dependency of the viceroyalty of Lima. In that year, however, was erected the viceroyalty of Buenos Ayres, which, to the basin in question, added Bolivia, under the name of upper Peru, thus embracing the head-waters of the Amazon, and also most of the plateau of Titicaca. The year 1806 ushered in a new order of things. Spain, as an ally of France, being then at war with England, both Buenos Ayres and Montevideo were occupied by the English—a change which, brief as was its duration, virtually sowed the seeds of revolution. The colonists had felt the inconvenience of belonging to a state which left them, in a great measure, to defend themselves; they had successfully tried their strength against a foe more powerful than their own masters; and they had been encouraged, not less by the sayings than by the doings of their invaders, to assert their independence. These influences were, in fact, instantaneously exemplified. The triumphant militia, after deposing and expelling the legitimate viceroy for cowardice, elected in his stead the French officer who had led them to victory. Thus had the viceroyalty of Buenos Ayres become peculiarly ripe for taking its share in the outbreak, which Napoleon's dethronement of the Bourbons, in the spring of 1808, almost immediately occasioned throughout Spanish America. The constituents of the A. R. did not, however, submit to the sovereignty of Joseph Bonaparte when he was shuffled on to the Spanish throne to replace Ferdinand VII. In 1810, they organized a government in the name of the latter monarch. This arrangement, which lasted only for a short and inglorious period, ended, like a great many others, in utter confusion. In 1816, a general congress declared the independence of the "united provinces of Rio de la Plata;" but those provinces, in 1827, returned once more to a state of isolation. In 1831, Buenos Ayres, Entre Rios, Corrientes, and Santa Fé, sometimes classed as the coast or riverine states, entered into a federal compact, and invited the others to form a voluntary alliance with them. This Argentine confederation led to little but anarchy till 1835, when gen. Rosas was elected captain-general or governor of it, with all but absolute power. He secured quiet and order for a time; but the great aim of his policy, both warlike and commercial, being to achieve the supremacy of Buenos Ayres, the struggles with this end in view, to which he was goaded on also by personal ambition and reckless daring, led to his ultimate overthrow in 1851. Buenos Ayres, refusing to submit to Urquiza, the next governor of the A. R., declared

itself independent in 1854; but was compelled by a signal defeat at Cepeda, in 1859, to re-enter the confederation. Continuing restless, however, another war, in which its army was ably led by gen. Mitre, placed that province in the position of supremacy which it still holds. In 1865, the A. R. became involved, along with Brazil and Uruguay, in a war against Paraguay, which ended only with the death of Lopez, president of Paraguay, in 1870, and which accomplished little in the interest or to the credit of the A. R. The boundless interior of this country has a standing feud with the narrow seaboard which shuts it out from the ocean; the Banda Oriental has been a bone of contention between the Brazilians and the Argentines; while England and France, with a view to the freedom of commerce, have thrown their weight in favor of its separate and independent existence. The jealousies also of Buenos Ayres and Montevideo are constant sources of irritation; and the relations with Chili are unfriendly, owing to disputed territory in Patagonia.

**ARGES**, a genus of small fishes, of the family *siluridae*, of extreme interest on account of their being frequently thrown out in vast numbers by some of the South American volcanoes, with torrents of muddy water. Humboldt was the first accurately to inquire into this wonderful fact, and to describe one of these fishes, which he referred to the genus *pimelodes*, and called *P. cyclopum*. It is now called *A. cyclopum*. The quantities of these fishes ejected from the volcanoes in the neighborhood of Quito is sometimes so great, that the stench of their putrefaction is felt at a great distance, and putrid fevers are caused by it. They are expelled from craters or from lateral openings at an elevation of 16,000 or 17,000 ft. above the sea. It is supposed that they exist in lakes within the cavernous recesses of the mountains, but nothing is positively known on this subject. Their capacity of enduring the high temperature of the water with which they are ejected, has excited much interest. Several species are known, to which the common name of *peradillas* is given in the country, and which are placed by ichthyologists in the genus *A.*, and the closely allied genera *brontes* and *astroblepus*.

**ARGIL**, clay or white clay, a term now little used, but of which the derivative *argillaceous* is still in frequent use as descriptive of soils, geological deposits, etc., and in the name *argillaceous slate* or *argillaceous schist*, instead of which, however, the name *clay-slate* (q.v.) is more generally employed. The term *argillaceous* is rather vague, and sometimes *clayey*, sometimes *aluminous*, would seem to be its equivalent. See **ARGILLACEOUS ROCKS**.

**ARGILE PLASTIQUE**, a series of beds at the base of the tertiary system in France, resting on a conglomerate or breccia of rolled and angular chalk-flints. They consist of extensive deposits of sand, with occasional beds of plastic clays, used for pottery. Marls occur, inclosing, in some places, the fluviatile shells that are met with in the same position in the London basin, and in others, large numbers of a species of oyster. Beds of impure lignite also occur.—The A. P. is the equivalent in the Paris basin of the Woolwich and Reading series, or lower eocene of the English geologists. See **Eocene**.

**ARGILLA'CEOUS ROCKS**. All rocks composed entirely or to some extent of clay are included under this title. Pure clay is known as *kaolin* or *porcelain clay*. It is a hydrated silicate of alumina. Decomposed feldspar, from which the silicates of potash, soda, etc., have been washed out, supplies the material which forms kaolin. *Common clay*, however, contains many impurities; the chief are sand, in variable proportions, and oxide of iron, which gives its color to the mass. Any matter that contains sufficient alumina (more than 10 per cent.) to enable it to retain its shape when molded and pressed, is called clay. Plastic clays occur abundantly in the superficial deposits and in the tertiary strata. The older clays become more or less indurated. When they are regularly laminated, and split into thin layers in the direction of the laminae, they are called *shale*. In *clay-slate*, the clay has become highly indurated and metamorphosed, so as to split into plates that are altogether independent of the original lamination, and frequently cross it at right angles. Clay-slate forms extensive deposits in the azoic rocks, but it is not confined to these, for the palaeozoic shales are often converted into clay-slate, when, from their proximity to crystalline rocks, or other cause, they have been subjected to the action of heat.

A. R. can generally be distinguished by the peculiar "argillaceous" odor which they give out when breathed upon.

**ARGIVES**, or **ARGIVI**, a name often applied by Homer, and sometimes by others, to all inhabitants of Greece, but more accurately only to those of the more powerful state or government of Argolis, in whose chief city, Mycenæ, Agamemnon had his residence. (See **ARGOLIS**, *ante*.)

**ARGO**, a large southern constellation, in which is commemorated the mythical ship of the Argonautic expedition. Canopus, a star of the first magnitude, is its chief ornament; its declination, 52° 38' s., renders it invisible in the northern and central United States.

**AR'GOL** is a crude variety of cream of tartar which forms a crust in the interior of wine vats and wine bottles. Originally, it exists in the juice of the grape, and is soluble therein; but during the fermentation of the juice, and as it passes into wine, much alcohol

is developed, which remaining in the fermenting liquor, causes the precipitation of the A.; the latter being very sparingly soluble in an alcoholic liquid. Some wines, when they are bottled, are not fully ripe, and more alcohol being thereafter developed, a further precipitation of A. takes place as a crust in the bottles, and hence the meaning of the term *crusted port*. A. is generally of a reddish tinge, obtained from the color of the grapes, but sometimes is of a grayish-white color, when it has been deposited during the fermentation of the juice of colorless grapes. The *red* or *white A.* is denominated in commerce *crude tartar*, and its principal uses are in the preparation of cream of tartar (q.v.) and tartaric acid (q.v.). The constituents of A. are bitartrate of potash (cream of tartar), (KO,HO,T), tartrate of lime, with coloring and extractive matters.

**AR'GOLA.** See ADJUTANT.

**AR'GOLIS**, the n.e. peninsula of the Morea (Greece), lying between the bays of Nauplia and Ægina, forms a nome, or department, in the modern kingdom of Greece. The plain of Argos, famous in ancient times for its breed of horses, is naturally fertile, but is now made pestilential by morasses. It is surrounded by an eastern continuation of the range of mountains on the n. of the Peloponnesus, which also girds the river and shattered-looking coast. The highest summits attain an elevation of between 5000 and 6000 ft. The plain of A. is the most extensive in the whole peninsula, being 12 m. in length and 5 in breadth. The eastern part is higher and more rocky than the western. Near where the plain opens on the sea, the ground is marshy. This was the Lernean marsh of antiquity. The nome of A. and Corinthia has now Nauplia as its capital, and contains 127,820 inhabitants.

It was from the importance of the ancient kingdom of A. that the Greeks were collectively often styled Argivi by ancient writers. A. was colonized in very early times. According to the old traditions, Inachus, the Pelasgic chief, settled here in 1800, and Danaus in 1500 B.C., with colonists from Egypt. Here Pelops ruled, and was succeeded by Atreus, Agamemnon, etc. Here also Hercules was born, and achieved his victories over the Lernean hydra and the Nemean lion.

The ancient capital, Argos, was situated about 3 m. from the sea, and was considered the oldest city in Greece. It was supposed to have been built by that Inachus of whom we have spoken, or by his grandson Argus; but as the whole period in which his deeds are said to have been accomplished belongs to the unhistorical age, we cannot possibly determine the truth of such a statement. It is certain, however, that at one period A. was the head of a league composed of several Doric states or cities—Cleonæ, Philus, Sicyon, Trezen, Hermione, Ægina, and Epidaurus. Latterly, Sparta robbed it of its supremacy and influence. The population of A., during its most prosperous condition in ancient times, was—inclusive of the town territory—upwards of 100,000. It was noted for the attention it paid to the worship of the gods. Juno was the principal divinity, but many of the other gods had temples and statues also. This gave a stimulus to the fine arts, and we know that A. possessed one of the most famous of the ancient schools of statuary. The natives were, moreover, renowned for their love of music. Herodotus considered them the finest musicians in Greece. They do not, however, seem to have cultivated literature. Few poets, and no orators or philosophers, were born amongst them. The modern Argos, built on the site of the ancient, is 7 m. from Nauplia, and is a large and thriving t. It still exhibits some remains of antiquity, though these were nearly wholly destroyed in 1825, during the Greek war of independence. Cotton, vines, and rice are grown. Pop. 11,000.

**AR'GONAUT**, *Argonauta*, a genus of cephalapodous mollusca, pretty generally known by the name of *paper nautilus*, and, in consequence of similarity in the form of the shell, often confounded with the genus *nautilus* (q.v.), but in fact much more nearly allied to the poulpe (*octopus*). The shell is not chambered like that of the true nautilus, but has one spiral cavity, into which the animal can entirely withdraw itself. The animal has no muscular attachment to the shell, and some naturalists therefore suspected that it might be merely, like the hermit crab, the inhabitant of a shell originally belonging to some other animal; but this question has been set at rest by the observations of Mme. Power, proving the beautiful but fragile shell to be the production of the A. itself. It has, however, also been discovered that the shell is peculiar to the female A., and does not answer the ordinary purposes of the shells of mollusca, but rather that of an "incubating and protective nest." The eggs, which are very numerous, are attached to filamentary stalks, and by these the whole compacted mass is united to the involuted spire of the shell, where it is usually concealed by the body of the parent. The descriptions, until recently admitted into the works of the most respectable naturalists, of argonauts sailing about in pretty little fleets upon the surface of the water, employing six of their tentacula as oars, and spreading out two, which are broadly expanded for the purpose, as sails to catch the breeze, are now regarded entirely as fabulous, and indeed are founded upon an entire misapprehension of the position of the animal in its shell, and of the use of the two expanded arms or *vela* (sails). The membranes of these arms are extended at the pleasure of the animal, so as to envelop the shell, and appear to be the secreting organs employed in its fabrication. Two species of A. are common in the Mediterranean.

**AR'GONAUTS**, heroes of Greek antiquity (so named from their ship *Argo*), who, according to tradition, about a generation before the Trojan war, undertook a long voyage into

unknown seas, under the command of Jason. Homer alludes to the story; Hesiod, Mimnermus, Pindar, the Pseudo-Orpheus, and many others relate it, all in different ways, the accounts in some instances being utterly irreconcilable. The plainest and most complete narrative is that of Apollodorus, which is as follows: Jason was commissioned by his uncle, Pelias—who ruled over Iolcus, in Thessaly—to fetch from the country of Æetes (Colchis) the golden fleece of the ram, which was suspended on an oak, and guarded by a sleepless dragon. He therefore caused Argus, the son of Phrixus, to build a ship of fifty oars; and, in pursuit of this adventure, gathered together the choicest heroes from all parts of Greece, fifty in number, with whom he sailed. Their first landing place was Lemnos, where the A. stayed two years, because the women, in consequence of the wrath of Aphrodite, had slain all the men, excepting Thoas. Next they sailed to the Doliones, and were hospitably received by king Cizycus, who was afterwards accidentally killed by Jason. After landing at Mysia, where they left Hercules and Polyphemus—who had wandered too far inland in pursuit of the lost Hylas—they came to the country of the Bebryces, where king Amycus was killed by Pollux, or Polydeuces, in a pugilistic fight. They next sailed along the coast of Thrace to Salmydessus, where two of their number, Zetes and Calais, having delivered the blind seer, Phineus, from certain winged monsters called Harpies, he in return gave them good counsel respecting their future adventures, and especially warned them against the dangerous passage between the opening and closing Symplegades, from which they escaped with but little injury to their vessel. The story goes that Phineus advised the A. to let loose a dove when they approached the dreaded rocks, and to judge from its fortune what they themselves might expect. The bird escaped with the loss of its tail. The A. resolved to risk the passage, and, after heroic efforts, got safely through, their ship only losing some of the ornaments of its stern. After visiting several other lands, they arrived at the mouth of the river Phasis, in Colchis. Here the king, Æetes, promised to give up the golden fleece to Jason, on condition that the latter should yoke to a plow the two fire-breathing bulls with brazen hoofs, and should sow the dragon's teeth left by Cadmus in Thebes. Jason, by the help of the famous sorceress Medea, daughter of Æetes, who had fallen passionately in love with the bold navigator, fulfilled these conditions; and was also assisted by Medea in still more wonderful exploits. He obtained from her, under promise of marriage, a charm against fire and steel, and was enabled to destroy all the warriors who sprung up from the land sown with the dragon's teeth. While this was taking place, Æetes had resolved to burn the ship *Argo*, and put to death the crew; but Jason, informed of the scheme by Medea, anticipated it, hastened into the grove, stupefied the dragon-sentinel by an opiate-charm prepared by Medea, seized the golden fleece, and, embarking in the *Argo* with his mistress and her brother Absyrtus, sailed away from Colchis by night. Æetes followed, but was hindered in his pursuit by an atrocity committed by his fierce daughter. It is said that she slew her brother Absyrtus, and cut him into several pieces, which she threw overboard, one at a time. While king Æetes stayed to gather up the fragments of his son, Jason escaped from the pursuit. The A. now reached the mouth of the river Eriadmus; but were driven on the Absyrtian islands by a storm sent from Jove, who was angry on account of the murder of Absyrtus. Meanwhile the mast of the *Argo*—which had been cut from the sacred grove of Dodona—delivered an oracle to the effect that Jove could not be appeased unless they sailed towards Ausonia, and were purified through the expiatory agency of Circe. This was accomplished; and next the A. passed by the Sirens, from whose charms they were preserved by Orpheus, who sang to them, but could not hinder one of their number, Butes, from swimming off to the sea-maidens; then through Scylla and Charybdis, by the help of Thetis, and at length landed on the island of Corcyra, where Alcinoüs ruled. On leaving this place, they encountered a storm at night, but were saved by Apollo, who, in flashes of lightning, revealed to them the haven of Anaphe, where they raised an altar to their preserver. At Crete, their landing was opposed by the giant Talus, who was slain by Medea. They subsequently touched at Ægina, and, sailing between Eubœa and Loeris, arrived safely at Iolcus, after a four months' voyage. Jason dedicated the good ship *Argo* to Neptune, at the isthmus of Corinth.

It is perhaps useless to speculate on the real character of the Argonautic expedition, even if it be more than a mere myth. The accounts given by other writers differ so widely, especially in the geographical parts, from those of Apollodorus, that it becomes impossible to determine satisfactorily whether the expedition sailed n., e., or w. The common historical interpretation of the legend is that Jason sailed on a voyage of discovery, which had for its aim and stimulus the hope of new commercial relations; others would modify this hypothesis, and suggest that the enterprise was partly commercial, partly piratical, and partly adventurous, and that Jason's crew was in all probability composed of young, restless, and ambitious spirits, who were ready for anything that might turn up.

ARGONNE, a rocky, tree-covered plateau in n.e. France, extending along the border of Lorraine and Champagne, and forming parts of the departments of Ardennes and Meuse. Dumouriez called his defense of this frontier in 1792 the "Argonne campaign."

ARGOON, or ARGUN, an affluent of the Amoor river, rising in the Mongolian mountains and running n.e. through the northern part of the desert of Gobi to lake Kulon;

thence n., separating Russian from Chinese Tartary, to meet the Shilka, the two forming the Amoor.

ARGOS. See ARGOLIS, *ante*.

ARGOS/TOLI, a seaport on the s.w. of Cephalonia, and capital of the island. Its lat. is 38° 10' n., and long. 19° 59' e. Its pop. is 8000; and its quay is a mile long.

ARGOT, French for what the English call "slang," especially the dialect of thieves and vagabonds. Like all such tongues, A. is often sparkling with wit and remarkable for aptness and comprehensiveness of expression. Many specimens of it are to be found in Victor Hugo's *Les Misérables*, and in the lower grade of Parisian journals and stories.

ARGUELLES, AUGUSTIN, a prominent Spanish politician of the modern liberal school. On the breaking out of the war of independence in 1808, he went to Cadiz, where he agitated for the organization of a regency along with a free constitution, as the best method of strengthening and consolidating the powers and resources of the nation. In 1812, he was sent as representative of his native province to the cortes, where he was appointed one of the members of the committee to whom was intrusted the drawing up of the plan of a new constitution. His splendid talents as a public speaker soon won him the admiration of the liberal party, who used to term him the Spanish Cicero. But on the return of Ferdinand VII., A. fell a victim to the reactionary spirit which ensued. On the 10th of May, 1814, he was arrested and imprisoned; but at his trial he displayed such dexterity that it was found impossible to convict him. Different judges were nominated five successive times, but they could not agree in their decision. At last the monarch himself passed sentence, which was that A. should be confined for ten years in the prison at Ceuta. He was not, however, alone in his misfortunes. Fourteen persons were condemned along with him, amongst whom was his friend Juan Alvarez Guerra. In their confinement they experienced such barbarous treatment, that in four years three died, two became mad, and the rest received grievous injuries. The revolution of 1820 restored them to freedom. A. became minister of the interior, but soon resigned, in consequence of the king complaining of the weakness of the executive. Although provoked beyond measure by the narrow bigotry of the court, he did not rush into extremes, but continued a constitutional liberal to the end of his life. In the cortes held at Seville in 1823, he voted for the suspension of the royal power; but after the violation of the constitution he fled to England, where he remained till the amnesty of 1832. On his return to Spain, being nominated to the cortes, he was repeatedly made president and vice-president of the chamber of deputies, and always showed himself a moderate but unwavering reformer. In July, 1841, on the discussion of the law regarding the sale of church property, he delivered himself strongly against all concordats with the pope. Next to Espartero, he was the most popular man in the kingdom with the enlightened party. During the regency, he was appointed guardian to the young queen Isabella, but d. soon after, on the 23d of March, 1844, at Madrid. In his old age, he still exhibited the fiery eloquence that marked his youth.

ARGUMENT (Lat. *argumentum*), in logic, means properly the ground or premise on which a conclusion is rested; popularly, it is applied to a series of arguments, or to a controversy. *Argumentation* is reasoning put into regular shape, with a view to convince or silence an objector. Logicians have given distinctive names to various kinds of arguments. Thus, we have the *argumentum ad hominem*, which is no real proof, but only an appeal to the known prepossessions or admissions of the persons addressed. In this style, when a man upholds one method of fraud, he may, by an appeal to his consistency, be driven to uphold another. The A. *ad veritatem*, again, has no regard to anything save objective truth. Next we have the A. *e consensu gentium*, or an appeal to the common belief of mankind, which, of course, may be used to prove or disprove anything. The A. *a tuto* rests upon the supposed safety or prudence of adopting a certain conclusion. It is sometimes used by Roman Catholics against Protestants in the following form: Protestants teach that salvation is possible in any church; this is denied by Catholics; therefore, it is safer to belong to the Catholic church, as even the Protestant admits that a man may be saved in that church. Lastly, the *argumentum a baculo* (or use of the cudgel), though objectionable, is concise in its style, and has settled many controversies.

ARGUMENTUM AD HOMINEM. See ARGUMENT.

ARGUS, the son of Zeus and Niobe, succeeded Phoroneus in the government of the Peloponnesus, which took from him its name of Argos, as did also the territory of Argolis.—A., surnamed Panoptes (all-seeing), had one hundred eyes, some of which were always awake. He was enormously strong, and, on account of the wonderful exploits he performed, Juno appointed him to watch over Io, transformed into a cow. Mercury being commissioned by Zeus to carry off the cow, slew A. by stoning him; or, as Ovid says, first charmed him to sleep by playing on the flute, and then beheaded him. Juno used the eyes of A. to decorate the peacock's tail.—A., the builder of the ship *Argo* (see ARGONAUTS).

**ARGUS**, a genus of gallinaceous birds, remarkable for magnificence of plumage. The only known species is *A. giganteus*, formerly called *phasianus A.*, and still very generally the *A. pheasant*. The sides of the head and of the neck are destitute of feathers; the tail consists of twelve feathers, of which the two middle ones in the male are very much elongated; the secondary feathers of the wings are much longer than the primary. The name *A.* has allusion to the many beautiful eye-like markings which adorn the plumage of the male, and particularly the secondaries of the wings. The long secondaries are said to impede the flight of the bird; but its wings are much employed to aid it in running. The female is of comparatively tame plumage, not only wanting the eye-like markings, but even the great length of the secondaries and of the middle tail-feathers. The size of the bird, when divested of its plumage, is not much greater than that of a common barn-door fowl, but the tail-feathers of the male are nearly 4 ft. long. The *A.* is a native of Sumatra and other eastern islands, of the peninsula of Malacca, Siam, etc. It is said to be found even in the northern parts of China. It is impatient of confinement, and has very seldom been brought alive to Europe.

**ARGYLE**, ARCHIBALD CAMPBELL, Marquis of, an eminent political character of the 17th c., was b. in 1598, and succeeded to the earldom of A. in 1638. Already he had given proofs of that strength of religious principle which marked his whole life, and of a perilous union of attachment to the king and of faith in the principles against which the king made war. In the general assembly at Glasgow, in Nov., 1638, he openly took the side of the covenanters, and thenceforth became recognized as their political head. In 1640, he commanded a military expedition through Badnoch, Athole, Mar, and Angus, for the purpose of enforcing subjection to the Scottish parliament. On the king's visit to Scotland, in 1641, he found it convenient to show peculiar favor to A., and created him a marquis. On the breaking out of hostilities, A. was still desirous for negotiation, but was finally compelled to take the field. In April, 1644, he dispersed the royalist forces under the marquis of Huntly, in Aberdeenshire. He was less successful in withstanding the genius of Montrose, who, on the 2d Feb., 1645, almost annihilated his army at Inverlochy. His estates had suffered so much in the preceding year from the ravages of the brilliant cavalier, that a sum of public money was voted for his support. In Aug., 1646, he went to London, with Loudon and Dunfermline, to treat with the parliament for a mitigation of the articles presented to the king. He was at the same time the bearer of a secret commission from the king, to treat with the duke of Richmond and the marquis of Hertford, on the propriety of a Scottish demonstration in favor of Charles. On the defeat of the "engagement" plan, to which he had been decidedly opposed, the government of Scotland devolved on A. and the other Presbyterian leaders. In the parliament of Feb. 1649, Charles II. was proclaimed king, and at Scone, on the 1st of Jan., 1651, A. put the crown on his head. At this time, it was even said that the complaisant monarch intended to marry one of his daughters. As head of the committee of estates, A. took vigorous measures to oppose Cromwell's invasion of Scotland, and still adhered to the king, after the subjugation of the country. After the battle of Worcester, he retired to Inverary, where he held out for a year against Cromwell's troops. Falling sick, he was taken prisoner by gen. Dean. He refused submission to the protector, but took an engagement to live peaceably, which he strictly kept. On the restoration, he repaired to Whitehall, encouraged by a flattering letter from the king to his son. Impeached with the crime of having submitted to the usurper (to whom he had refused allegiance), he was committed to the Tower, and on the 13th Feb., 1661, was brought before the Scottish parliament on the charge of treason. He defended himself with spirit, but in vain. On the 27th May, he was executed at Edinburgh—having displayed throughout his whole trial, and on the scaffold, the dignity of a true nobleman, and the meekness of a Christian.

His son, ARCHIBALD, 9th Earl of A., was early distinguished by personal accomplishments, and exhibited great bravery on the disastrous day of Dunbar, where he commanded a regiment on the royal side. After Worcester, he continued, like his father, in arms, and made himself so obnoxious to the parliamentary leaders, that he was specially excepted by Cromwell from the act of grace in 1654. After much harassing persecution, he submitted to the parliament, but continued to be closely watched. On the restoration of Charles II., he was received into high favor (as a balance to the execution of his father), and, unfortunately for his own fame, participated in some of the iniquitous acts of the Scottish legislature. He had, however, numerous and active enemies; and, on the ground of an intercepted letter, in which he had complained of neglect, he was tried and condemned to death by the Scottish parliament for the imaginary crime of *lesa majestas*. The influence of Clarendon restored him to liberty and favor; even the king himself was prejudiced in his favor; but his explanation in subscribing the infamous test framed by the Scottish parliament in 1681 was declared treasonable, and he was again condemned to death. The devotion of his wife enabled him to escape from Edinburgh castle in the disguise of a page; and after remaining concealed some time, he fled to Holland. Landing in the north of Scotland, in May, 1685, with an armed force, to co-operate in the revolt of Monmouth, he was, after a series of misfortunes, taken prisoner, hastily condemned, and beheaded, June 30, 1685. His son Archibald, one of the deputation sent by the Scottish convention to present the crown to the prince of Orange, was in 1701 created duke of Argyle.

**ARGYLE**, GEORGE JOHN DOUGLAS CAMPBELL, 8th duke of A., was b. in 1823, and succeeded his father in 1847. At the age of 19, his grace, then marquis of Lorn, wrote a pamphlet entitled *A Letter to the Peers from a Peer's Son*, on the subject of the struggle which ended in the disruption of the Scottish church. Seven years later he published an essay on presbytery, which contains a historical vindication of the presbyterian system. On taking his seat in the house of peers, he soon commanded the respect of that dignified assembly. On the formation of the coalition ministry by lord Aberdeen, his grace was invested with the office of lord privy seal, which he continued to hold in lord Palmerston's administration. In Nov., 1855, he relinquished his office, and accepted that of postmaster-general. On the fall of lord Palmerston's administration, he retired into opposition; and in 1859, on that nobleman's return, he again accepted the office of lord privy seal. On the formation of Mr. Gladstone's cabinet in 1868, he was appointed secretary of state for India. In 1854, he was chosen lord rector of the university of Glasgow; in 1855 presided at a meeting of the British association in that city; and in 1861, was elected president of the royal society of Edinburgh. His grace is hereditary master of the queen's household in Scotland, chancellor of the university of St. Andrews, a trustee of the British museum, also hereditary sheriff and lord-lieutenant of Argyleshire. Besides numerous papers on zoology, geology, etc., he has written *The Reign of Law*, 1866; *Primer of Man*, 1869; and, in 1870, *A History of the Antiquities of Iona*. In 1844, he married the eldest daughter of the duke of Sutherland (d. 1878). His eldest son, the marquis of Lorne, married the princess Louise in 1871; and in 1878 was appointed governor-general of Canada. In the ducal title, A. is now generally spelt Argyll.

**ARGYLE**, JOHN CAMPBELL, 2d Duke of, son of the first duke, was b. in 1678, and took an important part in the political and military affairs of his time. As royal commissioner in 1705, he had a principal share in bringing about the act of union. As a soldier, he distinguished himself under Marlborough at Ramilies, Oudenarde, Lille, Ghent, and Malplaquet. Previous to the change of ministry in 1710, A. had been a keen whig. He now veered with the wind of the court, and became a declaimer against the duke of Marlborough. As the reward of his apostasy, he was appointed by the tories generalissimo of the British army in Spain; but considering himself to have been unhand-somely treated by the ministry, he shortly after returned, and finding his influence greatly diminished, he again became a whig. His career up to the rebellion of 1715 was most tortuous and unprincipled, and seriously detracts from his meritorious services during that critical period. He was, however, completely successful in quelling disturbances, and his services were rewarded in 1718, among other dignities, with an English peerage, and the title of duke of Greenwich. His restless vanity and ambition, however, constantly prompted him to political intrigues. In 1721, he again played into the hands of the tories, for the purpose of securing the entire patronage of Scotland. In 1737, he rose into immense popularity in his own country, by his spirited defense before parliament of the city of Edinburgh in regard to the Porteous mob. He d. on the 3d Sept., 1743. He was a man of lax principles and selfish character, but possessed of considerable shrewdness and talent, and noted for his kindness and courtesy in private life. The benevolence of his disposition procured him the title of "the good duke of Argyle."

**ARGYLESHIRE** (*Airer-Gaethil*, territory of the Gael), a co. in the w. of Scotland, cut up into many peninsulas by arms of the sea, and including numerous islands. It is bounded n. by Inverness-shire; w and s. by the sea; e. by Perthshire, Dumbarton, Loch Long, and Firth of Clyde. Its greatest length is about 115 m.; greatest breadth, about 60 m.; its extent of coast-line is very great, amounting to 663 m., owing to the indentation of the coast by numerous lochs running inland. Next to Inverness, it is the largest co. in Scotland—area, 3210 sq. m., of which 1063 are occupied by the numerous islands. No part is above 12 m. from the sea or from large inland lochs. The co. is divided into the districts of Cantire, north and south Argyle, Lorn, Appin, Cowal, Morven, and Sunart. The chief islands are Mull, Islay, Jura, Tiree, Coll, Lismore, and Colonsay, with Iona and Staffa. There are upwards of thirty other islands of smaller size. The general aspect of A. is wild and picturesque, marked by rugged and lofty mountains and deep inland bays. Some fertile valleys exist. The north part is entirely mountainous, and presents some of the grandest scenery in Scotland, as Glencoe. The highest peaks are (Ord. Trig. Survey) Bidean nam Bian, 3766 ft.; Ben Cruachan, 3693; Buachael Etive, 3341—all in Lorn; Ben Ima (end of Loch Long), 3319; Ben More (Mull), 3185; Ben Creach (Morven), 2790; North Pap of Jura, 2565. The chief bays are (going south)—Loch Moidart, Loch Sunart, Linnhe Loch, branching off into Loch Eil and Loch Leven, Loch Fyne, and Loch Long. There are no rivers of any size. The streams are short and rapid, the principal being the Urchay, running through Glenorchy into Loch Awe, and the awe connecting that lake with Loch Etive. The inland or fresh-water lochs are Loch Awe and Loch Lydoch. The rocks of A. are mica-slate, which predominates on the main-land; trap in Mull and Lorn; quartz rock in Islay and Jura; granite around Loch Etive and in Knapdale; patches of lias and oolite in many of the isles; and a little old red sandstone w. of Loch Fyne and in South Cantire. Lead-mines occur at Strontian (where the mineral strontianite was discovered, and from which the names of the earth called *strontia* and the metal *strontium* are derived), at Tyndrum, and in Islay and Coll. A copper-mine exists in Islay. The Easdale and Ballachulish quarries supply the best

roofing-slates in Scotland. Coal occurs near Campbelton; fine marble in Tiree, etc.: excellent granite near Inverary; and limestone in most parts of the county. The fertile parts of A. lie along the arms of the sea and the mountain streams. The soil is mostly light, sandy, and gravelly loam along the coast and the sides of rivers, and gravelly, with a till bottom, on the hillsides. Sheep and cattle rearing are the chief occupations of the farmer. More sheep are reared in A. than in any other Scotch co., and nearly a million acres are in permanent pasture. In number of cattle, A. yields only to the counties of Aberdeen, Ayr, Lanark, and Perth. In 1875, A. had 23,552 acres under corn, and 12,131 under green crops, as well as 58,504 acres under permanent pasture, exclusive of heath or mountain-land. A. abounds in deer and game. Loch Fyne is famed for its herrings. Loch Awe abounds in salmon and trout.

In many parts of A. the peasantry are still very poor, notwithstanding that steamers now connect every portion of the coast with the commercial center of Scotland. The manufactures are unimportant, the chief being whisky, in Campbelton and Islay, and coarse woollens for home use. The chief towns and villages are Inverary, Campbelton, Oban, Dunoon, Appin, Lochgilphead, and Tarbert. The three former unite with Ayr and Irvine in returning one member to parliament; the co. returns another. Pop. in '71, 75,679, represented as mostly using the Gaelic language. This exhibits a considerable decrease since 1831, which has chiefly resulted from emigration. This extensive county is divided ecclesiastically into not more than fifty parishes, which contain only two royal burghs, Iverary and Campbelton, the former of which is a station of the circuit court of justiciary. The principal proprietors are the duke of Argyle, the head, and the earl of Breadalbane, a branch of the Campbell family. Among the antiquities of A. are the ruins of Iona and Oronsay, and many *duns*, or circular forts along the coast. In Cantire formerly lived the Macdonalds, or lords of the isles, whose power was weakened by James III.

**ARIA** (Ain), in music, a rhythmical song, as distinct from recitative. The term was formerly applied to a measured lyrical piece either for one or several voices; but is now commonly applied to a song introduced in a cantata, oratorio, or opera, and intended for one voice supported by instruments. **ARIETTA**, a short melody. **ARIOSO**, a passage in the style of the A., often introduced into recitative. **A. BUFFO**, a comic song, etc.

**ARIADNE**, a daughter of Minos, king of Crete, by Pasiphaë. When Theseus, with the offerings of the Athenians for the Minotaur, landed in Crete, A. conceived a passion for the beautiful stranger, and gave him a clew by means of which he threaded the mazes of the labyrinth, and was enabled to slay the monster. For this service, Theseus promised to marry her, and she escaped with him, but was slain by Diana on the island of Naxos.—According to another tradition, A. was left by Theseus at Naxos, where she was found by Bacchus returning from his triumph in India, who was captivated by her beauty, and married her. At her death, he gave her a place among the gods, and suspended her wedding-crown as a constellation in the sky. A., as left forsaken by Theseus, and as married to Bacchus, has been a favorite subject with artists.

**ARIALDUS**, a deacon of the church of Milan, who flourished during the 11th century. He took a prominent part in the ecclesiastical contentions of his times. The Catholic church in the n. of Italy was then very corrupt, a wide-spread licentiousness, originating from the unnatural institution of priestly celibacy, prevailed. Great numbers of the clergy kept concubines openly. Such as looked earnestly in those days at this flagrant evil, were disposed to consider the strict enforcement of celibacy the only effectual cure. Chief among these reformers stood A., whose life was one continued scene of violent controversy. Although successively sanctioned by popes Stephen X., Nicholas II., and Alexander II., he found little sympathy among his brethren, and used to complain that he could only get laymen to assist him in his agitation. Having at length succeeded in obtaining a papal bull of excommunication against the archbishop of Milan, a fierce tumult ensued in the city, whose inhabitants declared against A. and his coadjutors. A. now fled to the country; but his hiding-place being betrayed, he was conveyed captive to a desert isle in lake Maggiore, where he was murdered by the emissaries of the archbishop, and his remains thrown into the lake, June 28, 1065. He was afterwards canonized by pope Alexander II.

**ARIA'NA**. See **ARYAN RACE**.

**ARIA'NO**, *Arianum*, a city of south Italy, in the province of Avellino, beautifully situated 2800 ft. above the sea, in one of the most frequented passes of the Apennines, 50 m. n.e. from Naples. It is a bishop's seat, and has a fine cathedral. The chief manufacture is earthenware. There is a considerable export trade in wine and in butter. A. is said to have been founded by Diomed. Roger II. held a parliament here to settle the affairs of the province, after his defeat of the allied armies of pope Innocent II. and the prince of Capua. In the face of the hill on which the city is built, hundreds of caves have been dug, in which many of the poorer inhabitants dwell. Pop. 12,588.

**A'RIANS**. See **ARIUS**.

**ARIAS MONTANUS**, BENEDICTUS, a Catholic divine noted for his great linguistic attainments, was b. 1527, in the village of Frexenal de la Sierra, situated amongst the mountains separating Estremadura from Andalusia. He studied first at Seville, and

afterwards at Alcalá de Henares, where he distinguished himself by the ardor he manifested in the acquisition of the oriental languages, Arabic, Syriac, and Chaldee. He next proceeded on a tour through Italy, France, Germany, England, and the Netherlands, in the course of which he obtained a knowledge of various modern tongues. He was present at the celebrated council of Trent; but on his return to his own country, he resolved to retire into seclusion, and dedicate his whole time to literature. In 1568, however, Philip II. persuaded him to repair to Antwerp and superintend the publication of the famous edition of the "Polyglot Bible," executed in that city at the suggestion of the printer, Christopher Plantin. After four years' labor, the work was issued under the title *Biblia Sacra, Hebraice Chaldaice, Græce et Latine, Philippi II. Regis Catholici Pietate et Studio ad Sacrosanctæ Ecclesiæ Usus Chph. Plantinus excudebat*. It was received with universal applause. The Jesuits, to whom A. was sincerely and strenuously opposed, alone attempted to fasten the charge of heresy on the author, who made several journeys to Rome to clear himself of the accusation. Philip II. rewarded him with a pension of 2000 ducats, besides bestowing on him various other emoluments. He d. at Seville in 1598. His literary works are very numerous. They relate principally to the Bible and to Jewish antiquities; but he also wrote a poem on rhetoric, and a history of nature.

**ARICA**, a seaport of Moquega, the most southerly department of Peru, in lat. 18° 28' s., and long. 70° 24' w. Though it has merely a roadstead, it affords safe anchorage to shipping, and is one of the chief outlets of the trade of Bolivia, being connected with La Paz in that republic by a mule-path which leads across the west Cordillera of the Andes. Its exports mostly consist of copper, silver, alpaca, wool, and guano. A. has frequently suffered from earthquakes; a most destructive one occurred in 1868. About 230 vessels, of some 260,000 tons, enter this port annually, and about the same number clear it with cargoes. The climate is salubrious, the thermometer ranging from 86° F. in summer to 52° in winter.

**ARICHAT**, a seaport of Cape Breton island, in the province of Nova Scotia, with a harbor for the largest vessels. It is near the Gut of Canso, the most southerly of three channels of communication between the gulf of St. Lawrence and the Atlantic. The t. has about 1000 inhabitants, is largely engaged in fishing, and at the head of its harbor a lead-mine has recently been opened.

**ARIEGE**, or **ARRIÈGE**, a river in the s. of France, rises in the department of the east Pyrenees, flows through a beautiful vale, and falls into the Garonne near Toulouse.—The department of **ARIEGE**, which lies along the northern slopes of the Pyrenees, formed a part of the old co. of Foix, the territory of Couserans, and the province of Languedoc, is bounded n. and w. by Haute Garonne, e. by Aude, s. by the republic of Andorra and the Pyrenees. It contains some of the highest mountain-summits in France, such as Fontargente, 9164 ft.; Serrère, 9592 ft.; Montcalm, 10,513 ft.; Estats, 10,611 ft.; Montvalier, 9120 ft. The department, nevertheless, has a mild climate. Area, 1880 sq. m. Pop. '76, 244,795, engaged chiefly in agriculture, pasturage, iron-mines, and the manufacture of woollens, linen, pottery, etc. The three arrondissements are Foix, Pamiers, and St. Girons. Chief towns, Foix, Pamiers, St. Girons.

**A'RIEL**, used by Isaiah as a proper name, which he applies to Jerusalem, as "victorious under God." In Shakespeare's *Tempest*, A. is a spirit of the air, in the service of the magician "Prospero."

**A'RIES**, the Ram, one of the signs of the zodiac, including the first 30 degrees of the ecliptic measured from the vernal equinox, or that point where the vernal passage of the sun across the equator takes place. The vernal equinox, or, as it is also called, the first point of A., is constantly changing its position among the fixed stars, in consequence of the precession of the equinoxes, moving westward at the rate of 50".2 annually. It is from this circumstance that the sign A. no longer corresponds with the constellation A., which was the case about 2000 years ago, when the ecliptic was divided into 12 equal parts called signs, each named after the group of stars through which it passed. The present sign A. is the constellation Pisces, about 30° w. of the original sign; and although the sun at the vernal equinox will always be at the first point of A., yet nearly 24,000 years will elapse before that point will again coincide with the beginning of the constellation A.

**A'RIIL**, *Arillus*, a peculiar covering of the seed in some plants, formed by an expansion of the *funiculus* (the cord which attaches the ovule to the *placenta*), or of the *placenta* itself. This expansion takes place after fertilization, and sometimes invests the seed entirely, sometimes only partially. In the nutmeg, the A. forms what is called *mace*. In the spindle-tree (*eucynymus europæus*) it forms the remarkable orange-colored covering of the seed.

**ARINO'RI MORI**. See **MORI**, **ARINORI**.

**ARIN'OS**, a river of Brazil, which, after a n.w. course of 700 m., enters the Tapajos, itself an affluent of the Amazon, in lat. 9° 30' s., and long. 58° 20' w.

**ARION**, a celebrated lute-player, a native of Methymna, in Lesbos, about 700 B.C., was regarded by the ancients as the inventor of the dithyrambic meter. According to a tradition first given by Herodotus, and afterwards decorated by the poets, A. was sent

by Periander, ruler of Corinth, to Sicily and Italy, and at Tarentum won the prize in a poetical contest. As he returned laden with gifts in a Corinthian ship, the avaricious mariners determined to slay him and seize his wealth; of this the poet-musician was forewarned by Apollo in a dream. He asked for permission to try his skill in music; and after playing on his lute, threw himself from the deck into the sea. Here several dolphins, charmed by his music, had assembled round the vessel. On the back of one of them the musician rode safely to the promontory of Ténarus, where he landed, and journeyed on to Corinth. The sailors who, arriving afterwards, assured Periander that A. was dead, were confronted with him, when they confessed their guilt, and were crucified. The lute and dolphin were raised among the constellations; and the story became a favorite theme with artists. A. W. Schlegel, in one of his best poems, gives this story of A.

**ARIOS TO**, LUDOVICO, one of the greatest of Italian poets, was b. at Reggio, Sept. 8, 1474, being the eldest son of the military governor of that city. He was bred to the law, but abandoned it for poetry. However, at an early period of life, he was compelled to exert himself for the support of a large family, left as a burden on him at the death of his father. His imaginative powers were developed in early life. In 1503, after he had written two comedies, with several lyrical poems in Latin and Italian, he was introduced to the court of the cardinal Hippolytus d'Este, who employed him in many negotiations. Here, in Ferrara, in the space of about 10 years, he produced his great poem *Orlando Furioso*, which was published in that city, in 1 vol. 4to, in 1516, in 40 cantos. After the death of the cardinal, the duke, his brother, invited the poet to his service, and acted to him with great kindness and liberality. In the early part of 1521, a second edition of his poems was published, the *Orlando Furioso* being still in 40 cantos. Shortly after, he was commissioned by the duke to suppress an insurrection which had broken out in the wild mountain-district of Garfagnana; a task which seems more like a punishment than a mark of honor. A., however, succeeded in this arduous undertaking; and after remaining three years governor of the quarter, he returned to Ferrara, where he lived comfortably, nominally in the service of his patron, but in reality enjoying what he highly prized—an abundant leisure for prosecuting his studies. It was at this time that he composed his comedies, and gave the finishing touch to his *Orlando*. At length, in the latter part of 1532, that poem made its appearance in a third edition, enlarged to its present dimensions of 46 cantos. He now became seriously ill of a painful internal distemper, of which, after a few months of suffering, he d. on the 6th of June, 1533, in his 59th year, and was buried in the church of San Benedetto, at Ferrara, where a magnificent monument indicates the resting-place of his remains. A. is described as a man of noble personal appearance and amiable character. His *Orlando Furioso* is a romantic, imaginative epic, marked by great vivacity, playfulness of fancy, and ingenuity in the linking together of the several episodes. It takes its name and its theme from a chivalrous romantic poem by Boiardo, the *Orlando Innamorato*. That poem treats of the wars between Charlemagne and the Saracens, confounded as they were by tradition with those of Charles Martel, wherein Orlando, or Roland, stood forward as the champion of Christendom. Orlando is the hero of Boiardo's piece, and falls in love with Angelica, a clever and beautiful oriental princess, sent by the Paynim to sow discord among the knights of the Christian armies. The story of this lady being left unfinished in the *Orlando Innamorato* is taken up by A., who makes her fall in love herself with an obscure juvenile squire, on which Orlando gets furious, and long continues in a state of insanity. Besides his great work, A. wrote comedies, satires, sonnets, and a number of Latin poems, all more or less marked with the impress of his genius. In 1845, Giamperi, a librarian of Florence, announced that he had discovered at Argenta, near Ferrara, an autograph manuscript by A., containing a second epic, *Rinaldo Ardito*, describing, like the *Orlando*, the battles of Charlemagne and his paladins against the Saracens. The manuscript had been mutilated, and contained in a complete form only the cantos 3, 4, 5, while 2 and 6 were imperfect; and it was stated that the entire poem had consisted of 12 cantos. The work was published under the title *Rinaldo Ardito di L. Ariosto, Frammenti Inediti Pubblicati sul Manoscritto Originale*, Florence, 1846. In genius and style, it has been found by critics by no means to accord with the *Orlando*. Of the *Orlando* there are three several translations into the English language: the first, by Sir John Harrington, appeared in the year 1634; the second, by John Hoole, in 1783; and the third, by W. Stewart Rose, in 1823 and following years. In the last only is there to be found a fair representation of the feeling and spirit of the original.

**ARIOVISTUS** (probably the Latinized form of the German *Heer-fürst*, army-prince), a German chief, leader of the Marcomanni and other German tribes, was requested by the Sequani, a Gallic people, to assist them in a contest against the Ædui. Having gained a victory for the Sequani, A. was so well pleased with their fine country (now Burgundy), that he and his followers determined to abide there. Many other Germans followed him into Gaul, where he soon collected an army of 120,000 men. The Gallic people turned now for help towards the Romans, and Cæsar demanded an interview with A., who proudly replied, that "he did not see what Cæsar had to do with Gaul." After another message from Cæsar had been treated in the same scornful manner, the Roman forces under Cæsar advanced and occupied Vesontium (now Besançon), the chief city

of the Sequani. A furious engagement took place (58 B.C.), in which Roman discipline prevailed over the German forces, which were utterly routed. A., with only a few followers, escaped over the Rhine into his own country. His subsequent history is unknown.

**ARISPE'**, a t. in Sonora, the extreme n.w. department of the Mexican confederation. It is situated in the Sierra Madre, the western range of the Rocky mountains, on the banks of the Sonora, which is said to lose itself in an inland lake. Its pop. has been estimated as high as 7600. The surrounding district abounds in the precious metals, as also in cotton, wine, grain, and live stock.

**ARISTA** and **ARIS'TATE**. See **AWN**.

**ARIS'TA**, **MARIANO**, 1802-55, a Mexican general. He commanded at the battle of Palo Alto, May 8, 1846, and was defeated by the Americans under gen. Taylor. In 1848, he was minister of war, and two years later president of Mexico. In 1853, Santa Anna led a successful revolution, as the result of which A. was deposed and banished.

**ARISTE'US** (from a Greek word signifying *the best*), an ancient divinity whose worship in the earliest times was widely diffused throughout Greece, but whose myth is remarkably obscure. According to the common tradition, he was the son of Apollo and Cyrene, the latter the granddaughter of Peneius, a river-god of Thessaly. She is said to have given birth to A. on the coast of Libya, in Africa, whence the region is alleged to have derived its name of Cyrenaica. Hermes placed the child under the protection of the Horæ, the fosterers of cities, culture, and education. According to another tradition, A. was the son of the nymph Melissa, who fed the infant with nectar and ambrosia, and afterwards intrusted his education to Chiron. The great diversities in the legend were probably caused by the fusion into one of separate local divinities, whose functions were similar, and whose histories were, in consequence, carelessly commingled. After A. left Libya, he went to Thebes, in Boeotia, where he was taught by the muses the arts of healing and prophecy, and where he married Autonoe, the daughter of Cadmus, by whom he had several children. After the unfortunate death of his son Actæon (q.v.), he went to Ceos, where he liberated the inhabitants from the miseries of a destructive drought by erecting an altar to Zeus *Iemæus*—i.e., the rain-maker. He now returned to his native land; but shortly after, set out a second time on a voyage of beneficence. He visited the islands of the Ægean sea, Sicily, Sardinia, and Magna Græcia, leaving everywhere traces of his divine benignity. At last he went to Thrace, where he was initiated in the mysteries of Dionysus; and after a brief residence in the vicinity of Mt. Hæmus, he disappeared from the earth.

This myth is one of an extremely pleasing character, from the invariable beneficence which is attributed to A. It is less disfigured by anthropopathic errors than most of the myths of Greek divinities. A. was especially worshiped as the protector of vine and olive plantations, and of hunters and herdsmen. He also trained men to keep beehives, and averted the burning heats of the sun from the open fields. Later mythology often identified A. with the higher gods Zeus, Apollo, Dionysus.

**ARISTARCHUS** OF SAMOS, a celebrated ancient astronomer, of the Alexandrian school, who flourished 281-264 B.C. All his writings have perished, excepting a short essay on the sizes and distances of the sun and the moon. In this he shows the method of estimating the relative distances of the sun and the moon from the earth, by the angle formed by the two bodies at the observer's eye at that moment when the moon is exactly half luminous. It will be obvious from a glance at the annexed figure that the three bodies must then form a right-angled triangle, of which the moon is at the right angle. The angle MES, then, being observed, it is easy to find the ratio between EM and ES. This is quite correct in theory; but the impossibility of determining when the moon is exactly half illuminated, renders the method useless in practice. Besides, in the days of A., there were no instruments for measuring angles with anything like accuracy. A. estimated the angle at E at 83°, and determined EM to be  $\frac{1}{10}$  of ES; the truth being that the angle at E differs only by a fraction of a minute from a right angle, and that EM, the distance of the moon from the earth, is about  $\frac{1}{100}$  of ES, the distance of the sun. According to some accounts, A. held, with the Pythagorean school, that the earth moves round the sun; but this seems to be a mistake. Vitruvius speaks of A. as the inventor of a kind of concave sun-dial.

**ARISTARCHUS** OF SAMOTHRACE, a grammarian, who lived, about 150 B.C., in Alexandria, where he founded a school of grammar and criticism, and educated the children of Ptolemy Philopator. His life was chiefly devoted to the elucidation and restoration of the text of the Greek poets, especially of Homer. The form in which we now have the Homeric poems preserved is in a great measure owing to his judgment and industry. The strictness of his critical principles has made his name a general term for a severely just and judicious critic. Being afflicted with an incurable dropsy, he ended his life by voluntary starvation at the age of 72. The fragments of his writings that have been preserved are to be found scattered through the scholia on Homer, first published by Villoison (Venice, 1788).

**ARIS'TEAS**, an entirely fabulous character, who may be styled "the wandering Jew" of popular tradition in ancient Greece. First we find A. teaching Homer; then, some ages afterwards, b. at Proconnesus, an island in the sea of Marmora. It is stated that having visited the Arimaspeæ, the gold-watching griffin, and the Hyperboreans, he died on his return home; but, soon afterwards, a traveler asserted that he had been met and accosted by A. Consequently, neighbors searched the house where the body of A. was supposed to be lying, but it could not be found. Seven years afterwards he appeared as an author, and wrote a poem entitled *Arimaspeia*, in three books, giving accounts of northern and central Asia, which were copied by Herodotus and others. After thus establishing himself as a poet, he vanished again; and after 340 years of mystery, reappeared at Metapontum, in the s. of Italy, where he advised the people to erect an altar to Apollo, and an altar to "the everlasting A.," assuring them that, when Apollo founded their city, he (A.), in the form of a raven, had accompanied the god, and had assisted in the ceremony. In the early controversy of the Christian church, heathens sometimes quoted this tale of A. as a counterpart to the miracles recorded in the New Testament.

**ARISTIDES**, surnamed "THE JUST," was the son of Lysimachus, and descended from one of the best families in Athens. He was one of the ten leaders of the Athenians against the Persians at the battle of Marathon (490 B.C.). It had been arranged that each leader (or *strategos*) should hold the supreme command for one day; but A., who saw the folly of this want of unity, induced his companions to give up their claims, and make Miltiades commander-in-chief, which proved the means of winning the battle. In the following year A. was chief archon, and in this position, as in every other, secured the general respect of the citizens. Some years later, probably because he had opposed the plans of Themistocles, that unscrupulous leader brought about the banishment of A. It is said that when an illiterate citizen, who did not know him personally, requested him to write his own name on the voting shell, he asked the man whether A. had injured him. "No," said the voter; "but I am weary of hearing him always styled 'the Just.'" A. submitted to the sentence with dignity, praying to the gods, as he left the city, that the Athenians might not have cause to repent of their decision. Only three years later, Xerxes, with an overwhelming force, had invaded Greece. A., hearing that the Greek fleet was surrounded by that of the Persians, hastened from Ægina to apprise Themistocles of the danger, and offer his aid. After taking a prominent part in the battle of Salamis, A. was restored to popular favor, and soon afterwards aided greatly in achieving the victory at Platea, in which he commanded the Athenians. In 477 B.C., he introduced a change in the constitution, by which all citizens, without distinction of rank, were admitted to political offices. As showing the confidence reposed in A., it is related that Themistocles having announced that he had a scheme very advantageous for Athens, but which he could not disclose in a public assembly, A. was deputed to consult with Themistocles on the subject. The plan was to secure the naval supremacy of Athens by burning all the vessels of the other Greek states, her allies, then lying in a neighboring harbor. A. reported to the people that nothing could be more advantageous than the plan of Themistocles, but nothing could be more unjust; and the matter was immediately rejected by the people. After a variety of other public services, A. died in old age, and universally respected, 468 B.C., so poor that it is said his funeral had to be provided for by the public. He left a son and two daughters, for whom provision was made by state bounty.

**ARISTIDES**, **ÆLIUS**, surnamed **THEODORUS**, a Greek rhetorician, b. about 117 A.D. son of a priest of Zeus. He had a natural taste for rhetoric and public speaking, and won such renown for eloquence in Greece, Italy, Egypt, and Asia, that monuments were erected to him in several cities. He is said to have been very vain of his attainments in oratory. For 13 years he was afflicted with some strange nervous disease, apparently hypnotism, or nervous sleep, something like mesmerism. When Smyrna was destroyed by an earthquake, in 178, A. was living there, and wrote to the emperor Aurelius an eloquent account of the catastrophe; the emperor responded with substantial aid for the sufferers, and for this the grateful Smyrneans called Aristides the founder of the city, and erected to him a bronze statue. The only personal honor which he would receive was the appointment of priest of Esculapius, which office he held until his death about 189 A.D. His works extant consist of orations and declamations, which show no great power, and two treatises on rhetoric.

**ARISTIDES OF THEBES**, a Greek painter in the time of Apelles, about the middle of the 4th c. B.C., and brother of Nicomachus, who was one of his teachers. He was noted for power of expression in his work, one of his finest pictures being that of a babe approaching the breast of its mother who was mortally wounded, and whose face shows her fear lest the child should find blood instead of milk. His works were bought at enormous prices, and one of them was the first foreign painting ever exhibited to the public in Rome. He left two sons, Nicerus and Ariston, to whom he taught his art.

**ARISTIP'PUS**, the founder of the Cyrenaic school of philosophy among the Greeks, was the son of Aritades, a wealthy gentleman of Cyrene, in Africa, and was b. in that city about the year 424 B.C. Having come over to Greece to attend the Olympic games, he heard so much of Socrates, that he was filled with an eager desire to see the sage, and

hurried to Athens, where he became one of his pupils. He remained with Socrates up nearly to the last moments of the great teacher, though he does not at any period seem to have followed his doctrines or his practice. We know that subsequently he was the object of strong dislike, both to Plato and to Antisthenes, the stoic. He passed a considerable part of his life in Syracuse, at the court of Dionysius, the tyrant, where he acquired the reputation of a philosophic voluptuary. That his manners must have been at once extremely graceful and accommodating, is clear from the saying of his opponent, Plato, who declared that "A. was the only man he knew who could wear with equal grace both fine clothes and rags." Diogenes Laertius records a number of his *dieta*, some of which take the form of *bons-mots*, and indicate a sharp, cutting, lively, and self-complaisant nature. A. also lived at Corinth, in intimacy with the famous courtesan Laïs, but towards the close of his life, he is supposed to have retired to Cyrene. His daughter Arete seems to have been a person of superior abilities, inasmuch as her father imparted his leading doctrines to her, and she to her son, A. the younger (hence called *Metrodidaktos*, "taught by the mother"), by whom they are supposed to have been systematized. A., in all probability, published nothing during his life. He prided himself more upon spending his days in what he conceived to be a philosophical manner, than in elaborating a philosophical system for the benefit of the race.

The Cyrenaic school, all the teachers of which were probably imbued with the spirit of A. and merely carried out his doctrines to their legitimate results, professed a great contempt for speculative philosophy, and for physical and mathematical knowledge. They confined their investigations to morals, and formed an ethical system completely in harmony with the gay, self-possessed, worldly, and skeptical character of their master. The chief points of the Cyrenaic system were: 1. That all human sensations are either pleasurable or painful, and that pleasure and pain are the only criterions of good and bad. 2. That pleasure consists in a gentle, and pain in a violent motion of the soul. 3. That happiness is simply the result of a continuous series of pleasurable sensations. 4. That actions are in themselves morally indifferent, and that men are concerned only with their results. Wieland in his historico-philosophical romance, *Aristipp und einige seiner Zeitgenossen* (A. and Some of his Contemporaries), presents us with a charming picture of the life and opinions of the great philosophical sensualist, who stood out in strong relief against the gloom and austerity of Antisthenes and the cynical school. See Wendt's *De Philosophiâ Cyrenaicâ* (Gött. 1842).

**ARISTOBULUS**, an Alexandrian Jew who lived under Ptolemæus Philometer about 175 B.C., and was considered by the early fathers as the founder of the Jewish philosophy in Alexandria. He was long considered the author of the *Exegetical Commentaries on the Books of Moses* which went under his name, but it is now admitted that the work in question was the composition of a later period. Only fragments of it remain. It was intended to show that the oldest Greek writers borrowed from the Hebrew Scriptures; and to support this theory, numerous quotations were professedly taken from Linus, Musæus, Orpheus, etc., of which the Christian apologists made abundant use. These, however, have long been considered forgeries, inasmuch as they do not exhibit a trace of the antique Greek spirit, but make the writers speak in the tone and style of the Old Testament. See Valckenær's treatise, *De Aristobulo Judæo* (Leyden, 1806).

**ARISTOBULUS I.**, Prince of Judea, succeeded his father, John Hyrcanus, in 106 B.C. The son took the title of king, the first instance of its assumption among the Jews after the Babylonian captivity. He murdered his mother, to whom his father's will left the government, and imprisoned all but one of his brothers, and this one at a later period was put out of the way through the influence of Salome, the queen. During his reign he subdued the Iturians and compelled them to adopt Jewish laws. It is supposed that the death of A. was hastened by remorse for the crimes which he had committed.

**ARISTOBULUS OF CASSANDRIA**, probably the same with the Greek historian A., 330 B.C.; one of the companions of Alexander the great, whom he accompanied in his Asiatic expeditions. He did not write his history until he was 84 years old, and he died at 90. Subsequent historians, Arrian particularly, made free use of Aristobulus, work.

**ARISTOCRACY** (Gr. *aristokratia*, from *aristos*, best, and *kratos*, power) means etymologically the power or government of the best, noblest, or most worthy; and in the sense which it originally bore, A. had reference not to a social class, but to a form of government in which the sovereignty was placed in the hands of a minority of the citizens of the state, exclusive altogether of the slave population, which generally existed in antiquity. It is in this sense also that we use it when we speak of the Italian states of the middle ages as aristocracies. In order to constitute an A., it was further necessary that the minority which composed it should consist of the highest class, in point not of wealth alone, but of birth and culture; the government of a minority in numbers simply, being known by the more odious name of an *oligarchy*. Were the whole government of England intrusted to the house of lords, even though that body were to become vastly more numerous than it is, so long as it did not include half of the whole adult males, and were not elective, but hereditary, we should be ruled by an A., and our rulers would be aristocrats in the antique sense of the term. In this, its political sense, the term A. has

never been acclimatized in England, because the thing which it signifies has always been unknown. Our territorial nobility, though possessing great influence in the government of the country, has, at every stage of its career, been controlled either by the crown from above or the commons from below; and thus it is that, though more important as a social influence than in any other country, the English A. has never assumed the form of a ruling-class. When used with reference to English society, the term A. has two significations—a narrower and a wider one. According to the first, it is nearly synonymous with *nobility*. In this sense, it will be treated of under that head, and its relative subdivisions. According to the second, it is synonymous with *gentry*, and includes the whole body of the people, titled and untitled, above a certain very indefinite social line. Perhaps the nearest approximation which we shall make to a definition of A. in this, its proper English sense, will be by adopting that which Aristotle has given not of *aristocratus*, but of *eugeneia*, or good birth. "Good birth," he says, "is ancient (long inherited) wealth and virtue." (*Politie*. lib. iv. c. 7.) The question as to the extent to which either of these qualities is requisite to constitute a claim to admission into the ranks of the A., is one to which probably not two persons, either within or without the pale, would return the same answer; but that the absence of either would be a ground of exclusion, is a point on which there will be little difference of opinion. No amount of mere wealth will, in general confer it either on a tradesman or his immediate descendants (see GENTLEMAN); and scarcely any deeds, however noble, will give it to him who is not the possessor of inherited fortune. Neither Burns the gauger, nor Shaw the life-guardsman, has ever been regarded as an aristocrat, though nobody denies that the one was a poet, and the other a hero. But when the claim to recognition as an aristocrat has been inherited, it will scarcely be lost by the individual himself, however adverse may be his worldly circumstances, or however ignoble his conduct; and it is not difficult to imagine an elevation of moral tone which would confer it even on a beggar.

**ARISTOGEITON.** See HARMODIUS AND ARISTOGEITON.

**ARISTOLOCHIA**, a genus of plants of the natural order *aristolochiaceæ* or *asarineæ*. This order, which is dicotyledonous or exogenous, consists of herbaceous plants or shrubs, often climbing shrubs, and contains upwards of 130 known species, chiefly natives of warm climates, and particularly abundant in the tropical regions of South America. The leaves are alternate, simple, stalked, often with a stipule; the flowers axillary, solitary, hermaphrodite, of a dull color; the perianth at its base adhering to the ovary, tubular, sometimes regular, but generally very irregular; the stamens 6 to 12, epigynous (or inserted upon the ovary), distinct, or adhering to the style; the ovary is generally six-celled, with numerous ovules; the style simple, the stigmas radiating, as numerous as the cells of the ovary; the fruit dry or succulent; the seeds with a very minute embryo at the base of fleshy albumen.—The genus *A.* is distinguished by a tubular oblique perianth, generally inflated at the base, the mouth dilated on one side, and by stamens adherent to the style, so that it is included in the Linnæan class *gynandria*. The species are mostly shrubby, and natives of tropical countries, some of them climbing to the summits of the loftiest trees. Several are found in the s. of Europe; one only, the common BIRTHWORT (*A. clematitis*), occurs upon the continent as far n. as about lat. 50°, and is a doubtful native of England. It is a perennial plant, with erect, naked, striated stem—heart-shaped dark-green leaves on long stalks—the flowers stalked, and growing to the number of sometimes 7 together from the axils of the leaves, the tube of the perianth about 1 in. long, and of a dirty yellow color. It grows chiefly in vineyards, hedges, about the borders of fields, among rubbish, and in waste places. It has a long branching root, with an unpleasant taste and smell, which, with the roots of *A. rotunda* and *A. longa*, two herbaceous species, natives of the s. of Europe, was formerly much used in medicine, being regarded as of great service in cases of difficult parturition, whence the English name. These roots possess powerful stimulating properties, and those of the southern species are still used as emmenagogues. The root of *A. indica* is used in the same way by the Hindoos.—*A. serpentaria*, VIRGINIAN SNAKEROOT, is a native of most parts of the United States, growing in woods. It has a flexuous stem, 8 to 10 in. high, bearing heart-shaped very acute leaves. The flowers are on stalks, which rise from the root; the orifice of the perianth is triangular. The root has a penetrating resinous smell, and a pungent, bitter taste. It has long been a fancied remedy for the bite of the rattlesnake. It possesses stimulant and tonic properties. It forms an article of export from the United States to Europe, and bears a high price, being highly esteemed as a medicine in certain kinds of fever.—Its reputation as a cure for serpent-bites is shared by other species, particularly *A. angulicida* and *A. guaiaco* (the guaco of Colombia), natives of the warmer parts of America. The juice has certainly the power of stupefying, and even of killing serpents; and it is said that a number of species are used by Egyptian jugglers, in order to their handling serpents with impunity.—Several South American species seem also to possess medicinal properties analogous to those of the Virginian snakeroot.—*A. siphon*, a climbing shrub of 15 to 20 ft. in height, a native of the southern parts of the Alleghany mountains, is frequently planted in the United States, in Britain, and on the continent of Europe, to form shady bowers. It has very large heart-shaped leaves (a foot in breadth), of a beautiful green. The flowers hang singly, or in pairs, on long stalks; the tube of the perianth is crooked

in its upper part, inflated at the base, and veined with reddish-brown veins, having a sort of resemblance to the bowl of a tobacco-pipe, for which reason the shrub is sometimes called pipe-shrub, pipe-vine, or Dutchman's pipe. The tropical species are distinguished for their beauty and the peculiar forms of their flowers. Some of them are much prized ornaments of our hot-houses.

To the natural order *aristolochiaceae* belongs also the genus *ASARUM*.

ARISTOMENES, a Messenian statesman and general, who commanded the army in the second Messenian war. He fought with success from the battle of Derae, 685, until 668 B.C., when he was finally defeated, and returned to Rhodes, where his son-in-law was one of the reigning princes. His fame lasted through many centuries.

ARISTOPHANES, the only writer of the old Greek comedy of whom we possess any entire works, was the son of one Philippus, and was b. at Athens about the year 444 B.C. We know very little of his history. Plato, in his *Symposium*, relates that he was fond of pleasure—a statement which it is easy to credit when we consider the tendencies of his profession in all ages. It seems equally clear, however, from the vigorous and consistent expression of his convictions in his various works, and from the fearless manner in which he assails the political vices of his day, that he was possessed of an honest and independent spirit. He appeared as a comic writer in the fourth year of the Peloponnesian war (427 B.C.). The piece which he produced was entitled *Daitaleis* (the Banqueters), and received the second prize. It ridiculed the follies of extravagance, and, like all his subsequent works, was pervaded by a contempt of modern life, and an admiration of the sentiments and manners of the earlier generations. Next year, he wrote the *Babylonians*; in which he satirized Cleon, the so-called demagogue, so sharply, that the latter endeavored to deprive him of the rights of citizenship, by insinuating that he was not a real Athenian. This, in all probability, gave rise to the various traditions of A. having been born in Rhodes, Egypt, etc. Fragments of these plays remain. In 425, his *Acharnians* obtained the first prize. It was written to expose the madness of the war then waging between Athens and Sparta, and exhibits the feelings of the "peace-party" in the former city. It is still extant. In 424 appeared *Hippais*, the *Knights* or *Horsemen*. It was the first which the poet produced in his own name, and evinces the singular boldness of the author. It is leveled against Cleon, and presents us with a striking picture both of a vulgar and insolent charlatan, and of the fickle, cunning, credulous, and rather stupid mob over whom he precariously despotizes. It is related of this piece that, when no actor would undertake to play the part of the influential Cleon, A. himself impersonated the demagogue. Unfortunately for the character of Cleon, as well as that of the Athenian democracy, these caricatures and misrepresentations of A. have been received as historical pictures. How far they are from the truth, has been clearly shown by Grote, in his *History of Greece*. See CLEON. In 423, A. produced the *Clouds*, which, along with the *Knights*, are the two most famous of his comedies. They exhibit in overflowing richness that fancy, wit, humor, satire, and shrewd insight which characterize this greatest of all Greek comic writers. The *Clouds*, however, displays at the same time the weaknesses and limitations of A.'s mind. Its aim was to deride the pretensions of the new sophistical school, and to point out its pernicious tendencies. So far well. But A., who was no philosopher, demonstrates his own incapacity to appreciate the highest range of thought and character, by selecting no less a person than Socrates as the most perfect representative of a sophist. A., who was both religiously and politically conservative, had apparently no clearer conception of abstract truth than is involved in reverence for the sanctities of the past, the old gods, old traditions, old manners, and old sentiments. He had an instinctive hatred of innovations, and considered all equally pernicious. As he had represented Cleon the reformer as a vulgar innovator and demagogue, ruled by the lowest considerations, he makes the innovating views of Socrates also proceed from corrupt motives, veiled perhaps with more craft. Alcibiades is caricatured in this brilliant comedy as a wildly extravagant youth, whose career of ruin is accelerated by the insidious instructions of Socrates; and a hint is thrown out towards the end of the piece, which unfortunately proved to be the "shadow" of a "coming event." A. represents the father of Alcibiades as about to burn the philosopher and his whole *phrontisterion* (subtlety-shop); and there can be little doubt that this dramatic vilification of the purest of heathen moralists led to that persecution which, twenty years later, culminated in his condemnation and death. In 422 appeared the *Wasps*, still extant, in which the popular courts of justice are attacked; and three years later, in his *Peace*, he returns to the subject of the Peloponnesian war, which is ridiculed with great cleverness. In 414, he produced two comedies, *Amphitruus* and the *Birds*, both of which caricature, in the liveliest manner, the Sicilian expedition, then being meditated, but which proved so utter a failure. The *Lysistrata* belongs to the year 411, and exhibits a civil war of the sexes, as the monstrous issue of that in the Peloponnesus. In his *Plutus* and *Ecclesiazusae*, which respectively appeared in 408 and 392, true to his mission as the enemy of innovation, he assailed the new passion for Doric manners and institutions, and ventured to ridicule Plato, in that, however, in which the philosopher is weakest—namely, his political theory. Euripides, also, as the sophist among poets, is severely handled in the *Frogs*, which belongs to the year 405.

A. wrote 54 comedies, of which only 11 are extant. He is acknowledged to stand far

above all his contemporaries or successors of the middle and new comedy in wealth of fancy and beauty of language. His choruses sometimes exhibit the purest spirit of poetry; and Plato himself says that the soul of A. was a temple for the graces. The ingenuity which he displays in the mechanical artifices of verse is not less wonderful. Frogs are made to croak choruses, pigs to grunt through a series of iambs, and words are coined of amazing length—the *Ecclesiastusa* closes with one composed of 170 letters. It only remains to be added, what might naturally be expected, that the personalities in which A. indulged descend at times into coarseness and indecency, and that even the gods whom he undertook to defend are treated with levity, and placed in the most ludicrous lights.

The comedies of A. have been edited by Brunck (1781–1783), Dindorf (1794–1826), Bekker (1829). They have all been translated into German by Voss (Brunswick, 1821), and there are several translations of single plays into English.

**ARISTOTELIA.** See MAQUI.

**ARISTOTLE** was b. at the Grecian colonial town of Stageira, on the w. side of the Strymonic gulf (now the gulf of Contessa, in Turkey in Europe), in the year 384 B.C. He belonged to a family in which the practice of physic was hereditary. His father, Nikomachus, was the friend and physician of Amyntas II., king of Macedonia, father of Philip, and grandfather of Alexander the great. A. lost both parents while he was quite young, and was brought up under the care of Proxenus, a citizen of Atarneus, in Asia Minor, who was then settled at Stageira. It is to be conjectured that his education, such as it was, would take the direction of preparing him for the family profession, and that whatever knowledge and power of manipulation attached to the practice of physic at that time would rank among his early acquisitions. In after-life, he occupied himself largely in the dissecting of animals, and was acquainted with all the facts that had been derived from this source by others before him. It seems probable, however, that he early abandoned the intention of following physic as a profession, and aspired to that cultivation of universal knowledge for its own sake, in which he attained a distinction without parallel in the history of the human race.

In his 18th year (367 B.C.) he left Stageira for Athens, then the intellectual center of Greece and of the civilized world. Plato, on whom he doubtless had his eye as his chief instructor, was then absent at Syracuse in that extraordinary episode of his life connecting him as political adviser with the two successive Syracusan despots—Dionysius the elder, and Dionysius the younger—and with Dion. A., therefore, pursued his studies by books, and by the help of any other masters he could find during the first three years of his stay. On the return of Plato, he became his pupil, and soon made his master aware of the remarkable penetration and reach of his intellect. The expressions said to have been used by Plato imply as much; for we are told that he spoke of A. as the "intellect of the school." Unfortunately, there is a total absence of particulars or precise information as to the early studies of the rising philosopher. He remained at Athens twenty years, during which the only facts recorded, in addition to his studying with Plato, are, that he set up a class of rhetoric, and that in so doing he became the rival of the celebrated orator and rhetorical teacher, Isocrates, whom he appears to have attacked with great severity. It was in the schools of rhetoric that the young men of Athens got the principal part of their education for public life. They learned the art of speaking before the dikasteries, or courts of law, and the public assembly, with efficiency and elegance; and incidentally acquired the notions of law and public policy that regulated the management of affairs at the time. We can easily suppose that A. would look with contempt upon the shallowness—in all that regarded thought or subject-matter—of the common rhetorical teaching, of which, doubtless, the prevailing excellence would lie in the form of the address, being artistic rather than profound or erudite. One of the disciples of Isocrates, defending his master against A., wrote a treatise wherein allusion is made to a work (now lost) on proverbs, the first recorded publication of the philosopher.

The death of Plato (347 B.C.) was the occasion of A.'s departure from Athens. It was not extraordinary or unreasonable that A. should hope to succeed his master as the chief of his school, named the academy. We now know that no other man then existing had an equal title to that pre-eminence. Plato, however, left his nephew Spensippus as his successor. We may suppose the disappointment thus arising to have been the principal circumstance that determined A. to stay no longer in Athens; but there are also other reasons that may be assigned, arising out of his relations with the Macedonian royal family at a time when the Athenians and Philip had come into open enmity.

Whatever may be the explanation, he went in his 37th year, after a stay of nearly 20 years in Athens, to the Mysian town of Atarneus, in Asia Minor, opposite to the island of Lesbos. Here he lived with Hermias, the chief of the town, a man of singular energy and ability, who had conquered his dominion for himself from the Persians, at that time masters of nearly all Asia Minor. A. had taught him rhetoric at Athens, and he became in return the attached friend and admirer of his teacher. For three years the two lived together in the stronghold of Atarneus; but by treachery and false promises, the Rhodian Mentor, an officer in the Persian service, got possession of

the person of Hermias, put him to death, and became master of all the places held by him. A. accordingly fled, and took refuge in Mitylene, the chief city of the neighboring island of Lesbos. He also took with him Pythias, the sister of Hermias, and made her his wife. In a noble ode, he has commemorated the merits of his friend thus lost to him through the treachery of a Greek renegade. His wife, Pythias, died a few years afterwards in Macedonia, leaving him a daughter of the same name. His son, Nikomachus, to whom he dedicated his chief work on ethics—called, in consequence, *Nikomachean Ethics*—was born to him at a later period of his life by a concubine.

After two years' stay at Mitylene, he was invited (in the year 342 B.C., age 42) by Philip to Macedonia, to educate his son Alexander, then in his 14th year. What course of study Alexander was made to go through, we cannot state. He enjoyed the teaching of A. for at least three years, and contracted a strong attachment to his preceptor, which events afterwards converted into bitter enmity. The two parted finally when Alexander commenced his expedition into Asia (334 B.C.), and A. came from Macedonia to Athens, having recommended to the future conqueror, as a companion in his campaigns, the philosopher Calisthenes, whom he educated along with Alexander. Now at the age of 50, he entered on the final epoch of his life; he opened a school called the "Lyceum," from its proximity to the temple of Apollo Lyceus. From his practice of walking up and down in the garden during his lectures arose the other name of his school and sect, the *Peripatetic*. It would appear to have been his habit to give a morning lecture to select pupils on the more abstruse subjects, and one in the evening of a more popular kind to a general audience. He may now be supposed to have composed his principal writings; but, unfortunately, there is nothing known of the dates of any of them. This crowning period of his life lasted twelve years. After the death of Alexander, the anti-Macedonian party at Athens obtained an ascendancy, and among other consequences, an accusation was prepared against A., the pretext being impiety. With the fate of Socrates before his eyes, he chose a timely escape, and in the beginning of 322 B.C., took refuge at Chalcis in Euboea, where, in the autumn of the same year, he died, aged 62. He had long been afflicted with indigestion, and ultimately sank under this malady.

The *philosophy* of A. differed from that of Plato on many points, especially in the fundamental doctrine termed the theory of ideas. The Platonic "ideas" or "forms" were conceived as real existences, imparting all that is common to the particular facts or realities, instead of being derived from them by an operation of the mind. Thus, the actual circles of nature derive their mathematical properties from the pre-existing "idea," or circle in the abstract; the actual men owe their sameness to the ideal man. A. was opposed to this doctrine throughout, although he always speaks of its author with respect, and sometimes with affection. The whole method of A. was in marked contrast to the Platonic handling of philosophical subjects: he was a most assiduous observer and collector of facts, from which he drew inductions with more or less accuracy. Plato, on the other hand, valued facts merely in criticising the views that he was bent upon demolishing, and not as a means of establishing sound theories.

The writings of A. may be said to have embraced the whole circle of the knowledge of his time. Many of them are lost; those that remain refer principally to the following departments.

Astronomy, mechanics, physics, were treated of by him at some length; but here his failure was complete, if we look at his writings from the point of view now acquired. He was the victim of capricious fancies, based upon doctrines common among his contemporaries, accepted by him as principles of reasoning, and conducting him to the most unsound conclusions. His theory of the rotation of the sphere, the necessary perfection of circular motion, of the impossibility of a vacuum, and the like, did more to confuse than to explain the phenomena of nature. Nor can it be said that the time was not ripe for putting these subjects on a rational basis; for he was very shortly followed by a series of men, who both observed and reasoned soundly respecting them, and laid the foundation of their great subsequent progress—namely, Euclid, Apollonius, Archimedes, Eratosthenes, and Hipparchus.

The thirteen books called metaphysics contain much profound thought, but are obscure and defectively arranged; indeed, neither the actual arrangement of the books nor the title which they bear, can be ascribed to A. himself. The subject to which they are devoted is ontology—the science of *ens*, *quatenus ens*—which he terms *philosophia prima*, and sometimes theology. He distinguishes three branches of theoretical philosophy. 1. Physics—the study of sensible material particular things, each of which differs from every other, and all of which have in themselves the principle of change or motion. 2. Mathematics—that of geometrical and numerical entities, known by general definitions, susceptible neither of change nor of movement, capable of being considered and reasoned upon apart from matter, but not capable of existing apart from matter. 3. The first or highest philosophy—which studies the essences of things eternal, unchangeable, and apart from all that change, movement, and differentiation which material embodiment involves.

The metaphysics, or first philosophy, does in fact deal with the extreme abstractions or generalities of all sciences. It is a collection, partly of doubts and difficulties, partly of attempted solutions, upon these last refinements of the human mind. It includes

many valuable comments on the philosophy of Plato and others anterior to or contemporary with A. The general terms and subtle distinctions which this treatise first brought to view, were highly prized throughout all the philosophy of the middle ages.

He appears in a very different light in his great work on animals. He has here amassed a stock of genuine observations, and also introduced a method of classification which continues to this day as the most approved groundwork of zoological classification. In this work we see perhaps, in the most advantageous light, the two great qualities of his mind, rarely coupled in the same individual—the aptitude for observation and logical method. The excellence shown in his various writings generally depends upon one or other of these qualities.

His organon or logic is his complete development of formal reasoning, and is the basis and nearly the whole substance of syllogistic or scholastic logic. This science he almost entirely created. Mr. Grote observes (*History of Greece*, part ii. chap. lxviii.) that “what was begun by Socrates, and improved by Plato, was embodied as a part of a comprehensive system of formal logic by the genius of A.; a system which was not only of extraordinary value in reference to the processes and controversies of its time, but which also, having become insensibly worked into the minds of instructed men, has contributed much to form what is correct in the habits of modern thinking. Though it has now been enlarged and recast by some modern authors (especially by Mr. John Stuart Mill in his admirable *System of Logic*) into a structure commensurate with the vast increase of knowledge and extension of positive method belonging to the present day—we must recollect that the distance between the best modern logic and that of A. is hardly so great as that between A. and those who preceded him by a century—Empedocles, Anaxagoras, and the Pythagoreans; and that the movement in advance of these latter commences with Socrates.”

A considerable portion of his writings relate to the human mind and body. In one of these, a short treatise on *Memory and Recollection*, he gave the first statement of the laws of association of ideas.

His treatises on rhetoric and poetics were the earliest development of a philosophy of criticism, and still continue to be studied. The same remark is applicable to his elaborate disquisitions on ethics.

Perhaps one of his greatest works is his *Politics*, based upon a collection made by himself of 158 different constitutions of state; the collection itself being unhappily lost. Here we see the spirit of the inductive observer, which indeed is no less apparent in the works mentioned in the last paragraph. It is, however, a singular fact, that he gives no evidence of having read the historian Thucydides; and his only reference to Herodotus is on a point of natural history. Yet the narratives and descriptions contained in the works of both these writers are probably of as much value, and as much in point, in a political philosophy, as the very best observations made by himself.

The great current distinctions of matter and form, substance and quality, actuality and potentiality, are due to A. See Grote's *Aristotle*, 1872.

**ARISTOXENUS**, of Tarentum, a pupil of Aristotle's, and one of the oldest writers upon music, flourished about 330 years B.C. He was extraordinarily active and versatile in his literary studies, and is said to have composed upwards of 450 treatises on music, history, and philosophy. On the death of Aristotle, he fully expected to be appointed his successor, and is said to have been deeply mortified when Theophrastus was preferred; but this statement is discredited by many. He founded a school of musicians, who were called after him, Aristoxeneans, and whose distinguishing characteristic was that they judged of the notes in the diatonic scale exclusively by the ear, while the Pythagoreans determined these mathematically. Except his *Elements of Harmony*, in three books, which we still possess, only a few fragments of his writings survive in later authors.

**ARITA**, one of the most famous seats of the Japanese porcelain industry, in the province of Iizen, Japan, containing 8 or 10 quarries of finest kaolin clay. The town lies 300 ft. above the sea, contains 80 potteries and 12 kilns; pop. 6400. Seven other villages devoted to the ceramic industry are near A., and receive their clay from its quarries. These contain in all 100 porcelain and faience factories, and in each village are two *nobori*, or series of kilns with from 12 to 14 ovens each. Some of the kilns have 22 chambers. All the *nobori* are built up the sides of a hill, so that the heat and flames may ascend from the lowest to the topmost oven. The baking of the biscuit ware requires 24 hours, the pieces being left in 20 days for annealing. Fine vases have three firings, one for biscuit, one for glaze, and the final for color and gilding. The beds of clay were first discovered and put to use towards the end of the 17th century. They are the detritus of old volcanic rocks, are white, compact, and amorphous, with few visible crystals of quartz. Though of various qualities, they are practically inexhaustible. Smaller beds furnish fine-layered clays, which yield light yellow and green glazes. From A. came most of the Japanese porcelain and faience long renowned in Europe, and now so familiar in America. The wares, carried on the backs of men for safety, are shipped from Imari, the seaport, or from Nagasaki, hence sometimes receiving the names of the latter places.

**ARITHMETIC** is the science that treats of numbers (Gr. *arithmos*). It is sometimes divided into theoretical and practical; the former investigating the properties of numbers and their combinations, the latter applying the principles so established, in the form of rules, to actual calculations. Some restrict the term A. to this art of reckoning, assigning the investigation of the principles to analysis.

Among the ancient Greeks and Romans, A. made little progress, owing to their clumsy modes of notation. Few of their writings on the subject have come down to us; the most important are those of Euclid (7 to 10 B. of the *Elements*), Archimedes, Diophantus, and Nicomachus. After the introduction of the decimal system and the Arabic or Hindu numerals (see NUMERALS), about the 11th c., A. began to assume a new form; but it was not till the 16th c. that the double rule of three, or compound proportion, was discovered, and decimal fractions were introduced. The invention of logarithms in the 17th c. is the last great step in advance that the art has made. Passing over the elementary operations of addition, etc., the chief heads, such as FRACTIONS, DECIMALS, PROPORTION, LOGARITHMS, etc., will be noticed in their proper places.

**ARITHMETICAL MEAN** is that number that lies equally distant between two others; thus, the A. M. between 11 and 17 is 14, which is found by taking half their sum.

**ARITHMETICAL PROGRESSION** is a series of numbers that increase or diminish by a common difference, as 7, 10, 13, 16, 19, 22; or 12, 10½, 9, 7½, 6. To find the sum of such a series, multiply the sum of the first and last terms by half the number of terms. The series of natural numbers, 1, 2, 3, 4, etc., form an A. P., of which the difference is 1.

**ARITHMETICAL SIGNS** are arbitrary marks or symbols used to denote the operations to be performed on numbers, or the relations existing between them. *Ex. gr.*,  $7 + 5$  indicates that 7 and 5 are to be added together;  $7 - 5$ , that 5 is to be subtracted from 7;  $7^5$  that 7 is to be raised to the fifth power;  $7 + 5 = 15 - 3$ , that when 7 and 5 are added together, the result is equal to the difference between 15 and 3. The same signs are also used in algebra; and an enumeration and explanation of them may be found in almost any treatise on arithmetic or algebra.

**ARIUS**, the celebrated founder of Arianism, was a native of Libya, and is generally supposed to have been b. shortly after the middle of the 3d century. About the year 306 A.D., Alexandria was thrown into confusion by the violence of its religious disputes, and in these A. was largely mixed up. At first, he took part with Meletius, bishop of Lycopolis, in upper Egypt, a man who was strenuously opposed to certain notions of discipline entertained by Peter, bishop of Alexandria; but afterwards he became reconciled to the latter, who made A. a deacon. The reconciliation, however, was brief. A. once more took the part of Meletius, and was excommunicated by Peter in consequence; but the latter dying soon after, Achilles, his successor, restored A. to his office, and even advanced him to the dignity of a presbyter, 313 A.D. His new function required that he should interpret the Scriptures, and, as he possessed an abundance of natural gifts, united with great learning, it is not wonderful that his preaching should have become popular, and his peculiarities of opinion been vehemently embraced. The first time, however, that A. was brought into collision on a point of doctrine with his ecclesiastical superiors, was in 318 A.D. Alexander, bishop of Alexandria, and successor of Achilles, having in a public assembly of clergy, while speaking of the Trinity, said that it contained one single essence, or indivisible unity of substance, A. alleged that such a conception was impossible to the human mind, and accused Alexander of Sabellianism—i.e., of destroying the distinction of persons. The dispute grew hot, and a conference which was held to settle it only embittered the disputants. In maintaining his ground, A. went beyond his first statement of the absolute distinctness of person between the Father and the Son; he maintained that the Son was not co-equal or co-eternal with the Father, but only the first and highest of all finite beings, created out of nothing by an act of God's free will, and that he ought not to be ranked with the Father.

A. was successful in securing the adherence of large numbers both of the clergy and laity in Egypt, Syria, and Asia Minor. In 321 a synod of bishops was held at Alexandria. These deposed and excommunicated A., and active measures were taken to let this decision be known over all the Christian churches; Alexander himself wrote numerous letters (two of which are still extant), exhorting the bishops not to receive the "heretic." In consequence of these violent steps, the breach was widened between both parties. To escape persecution, A. retired to Palestine, where he wrote a letter to his friend Eusebius, who was bishop of Nicomedeia, a city of Bithynia, and not far from Constantinople. Eusebius, one of the most influential Christians of his time, warmly sympathized with him; wrote in his behalf to Paulinus, bishop of Tyre, and others; absolved him from the Alexandrian synod's excommunication; and in 323 convened another synod in Bithynia, which pronounced favorably on A. He even enlisted Constantine on the side of the latter, to this extent at least, that the half-pagan emperor addressed admonitions to both Alexander and A., assuring them that the point in dispute was a trifling one, and ought not to provoke a serious quarrel. While A. was residing at Nicomedeia, he wrote a theological work in verse and prose, called *Thaleia*, some fragments of which remain, and indicate an earnest and philosophic mind, but at the same time contain expressions which could not but pain a believer in the divinity of

Christ. The *Thaleia* is said to have been sung by the Arian neophytes, who thus kindled the passions of their adversaries, and increased the virulence of the contest. The comedians, who were pagans, took advantage of the occasion to ridicule the Christian religion in the theaters. The officers of the emperor in several cities wished to repress this profane temerity, but the interference only created greater confusion.

It now became impossible for the emperor to remain neutral or indifferent, with safety to himself, or to the tranquillity of the empire. Hosius, bishop of Corduba, whom he had appointed mediator betwixt Alexander and A., took part with the former, and reported unfavorably of A. The result was, that Constantine, in order, as he thought, to effect a final settlement of the question, convoked the memorable council of Nicea (Nice, q. v.), in Bithynia, 325 A. D. Three hundred and eighteen bishops from almost all parts of the Christian world, but especially from the east, were present, besides numbers of priests, deacons, and acolytes. A. boldly expounded and defended his opinions. He declared in the most unambiguous manner that the Son of God was created out of nothing; that he had not always existed; that he was not immutable or impeccable; that it was through his free-will he remained good and holy; that if he had chosen, he could as easily have sinned as not; in a word, that he was a mere creature and work of the Deity. He further affirmed that the Son of God was not of the same substance with the Father; that he was not the "Word" or "Wisdom," properly speaking; and that the Scriptures only attribute these names to him as they do to other created intelligences. These propositions were listened to with great calmness by the bishops, but the inferior clergy, or at least a majority of them, manifested the most violent opposition. The document containing his confession of faith was torn to pieces before his face. Arguments, however, of a more rational kind were also employed. Alexander was ably seconded by the young deacon, Athanasius, the equal of A. in eloquence, and in the power of his logic. It was principally by the reasonings of Athanasius that the council was persuaded to define, in the most precise manner, the doctrine of the Godhead—viz., the absolute unity of the divine essence, and the absolute equality of the three persons. All the bishops subscribed it except two, Theonas of Marmarica, and Secundus of Ptolemais, who had the heroism (for it must be considered such) to follow the banished A. into Illyricum.

An imperial edict was now issued commanding the writings of A. to be burned, and threatening with capital punishment all who should be convicted of concealing them. This change in the emperor's sentiments as to the importance of the doctrine at issue is attributed by some writers to his recognizing the will of heaven in the harmonious consent of so many bishops. A more probable explanation is, that he anticipated the utmost social confusion from the collision of opinions, and resolved to crush that which was at once the youngest and the weakest, hoping thereby to remove the ground of disturbance. He was mistaken, however. At Alexandria, the Arians continued in a state of open insurrection, and began to league themselves with other condemned sects, for the purposes of mutual defense. The great influence of Eusebius was also exerted on behalf of the exiled heretic, as well as that of Constantia, the sister of the emperor, who had herself embraced Arian tenets, and in 328, permission was granted him to return from Illyricum. Constantine was very gracious, perhaps because he thought the chances of peace being restored to the community were now greater, for it had been represented to him by Eusebius that the doctrines of A. did not essentially differ from those of the Nicene council. In 330 A. D., A. had an interview with the emperor, and succeeded in convincing him that Eusebius had only spoken the truth. In the confession of faith which he presented, he declared his belief that the Son was born of the Father before all ages, and that as the "Word," he had made all things both in heaven and earth. The emperor was satisfied, and sent orders to Athanasius, now bishop of Alexandria, to receive A. into the communion of the church. This Athanasius refused to do, and a series of tumults was the consequence. Eusebius was greatly irritated. He called a synod of bishops at Tyre, in 335 A. D., which proceeded to depose Athanasius. The emperor was even prevailed on to remove the latter to Gaul, though he alleged as his reason that he wished to deliver him from the machinations of his enemies. In the same year, another synod met at Jerusalem, which revoked the sentence of excommunication uttered against A. and his friends. Still the majority of the Christians of Alexandria clung to the doctrines of Athanasius, and resolutely resisted every effort to establish the new opinions among them. Disappointed in his expectations, A., in 336 A. D., proceeded to Constantinople, where he presented the emperor with another apparently orthodox confession of faith; whereupon orders were issued to Alexander, bishop of Constantinople, to administer to Arius the holy communion on the Sunday following. This was considered a grand triumph by Eusebius and his friends, and when the day arrived, they escorted A., as a guard of honor, through the streets of the metropolis. When about to enter the temple in which it was intended that he should be received with solemn pomp, he retired a moment to relieve nature, but fainted, and died of a violent hemorrhage. His disciples declared that he had been poisoned, while the orthodox devoutly affirmed that God had answered the prayers of Alexander.

A. was exceedingly handsome, but the harassing cares of a life spent in a continual struggle with his adversaries, are said to have given him a worn and haggard look. His manners were graceful and modest; he was noted for even an ascetic abstinence, and the

urity of his moral character was never challenged by a single enemy. A. is said to have composed songs for sailors, millers, and travelers, in popular measures, for the purpose of spreading his peculiar tenets; but no traces of these survive.

After the death of A., his followers rallied round Eusebius, now bishop of Constantinople (338), from whom they were styled Eusebians. The reconciliatory middle party of Eusebius of Cesarea (d. 340 A.D.), who wished to end the great controversy by abstaining from all strict dogmatic assertions on the matter, soon dwindled into insignificance between the two contending parties. Constans, who ruled the west after the death of Constantine (337), and Constantius, in the east, made an essay towards reconciliation; but it failed at the synod of Sardeis (347), where the occidental bishops gathered themselves round Athanasius in support of the *homoousian* doctrine (identity or sameness of substance), while in a separate council at Philippopolis, the oriental bishops asserted the *homoiouian* doctrine (implying merely similarity of substance). Slight as might appear the verbal difference between the two parties, the bitterness of the controversy was intense, and pervaded almost all departments of public and private life. Constantius having, by the death of Constans (350) and conquest over Magnentius (353), gained dominion over the west, the Arian cause, which he favored, triumphed at the synod of Arelate or Arles (353), and at that of Milan (355). These victories, however, were more apparent than real. The Nicene doctrine had still strong support on its side, and was strictly maintained by the banished Athanasius and his friends, while the Antiniceans, soon after their triumph, were divided into at least three parties. The old Arians, also styled Anomœoi, or Heterousians, asserted, in the boldest style, their doctrine of "distinct substances." The semi-Arians (a large majority in the eastern church) maintained the homoiousian doctrine of similar substances. A third party held the same doctrine with some qualification. Morally, the victory was leaning to the side of the Nicæans. Julian the apostate (361-363), in his hatred of the Christian religion, left all parties at liberty to contend as they pleased with one another, so that they did not interfere with his plans. Jovianus and his followers in the west, Valentinianus I., Gratianus, and Valentinianus II., extended full toleration to both parties. Arianism, at last, was virtually abolished in the Roman empire, under Theodosius in the east (379-395), and Valentinianus II. in the west. Among the German nations, however, it continued to spread through missionary efforts. Bishop Ulfilas, the translator of the Bible into the Mæso-Gothic language, had been the means of converting the west Goths to Arian Christianity as early as 348; and they adhered to it until the synod of Toledo in 589. The east Goths, Vandals, Burgundians, the Suevi in Spain, and the Longobards also adopted Arianism; but in all these instances the Nicene doctrine ultimately prevailed, most slowly among the Longobards, who retained the Arian creed until 662. The Arian controversy has never excited any great interest in modern times, though in England it was revived for a time by the writings of the learned Dr. Samuel Clarke (1675-1729), and also by Whiston, who d. in 1752. More recently, a part of the Arian doctrine, the denial of "the eternal sonship," was broached in the Wesleyan Methodist society by Dr. Adam Clarke and a few followers; but it was soon suppressed by the conference. Pure Arianism can hardly now be said to exist. It has gradually lapsed into Unitarianism. See UNITARIANS.

**ARIZONA**, a territory of the United States, lying between 31° 20' and 37° n. lat., and 109° and 115° w. long. It is bounded n. by Nevada and Utah, e. by New Mexico, s. by Mexico, w. by California. Area, 113,916 sq. miles. The surface consists of elevated table-lands intersected by mountains and interspersed with valleys. Grazing lands cover three fourths of the territory, but its chief wealth lies in its mineral resources. Pop. '70, 9658; capital, Prescott. A., formerly a part of New Mexico, was organized as a separate territory in 1863.

**ARIZONA** (*ante*), one of the territories of the United States, bounded n. by Utah, e. by the territory of New Mexico, s. by Mexico, w. by the states of California and Nevada, extending from 31° 37' to 37° n., and from 109° to 114° 25' w.; area about 114,000 sq. miles. This territory was taken in 1863 from that of New Mexico, including also the Gadsden purchase, and in 1870 had 9568 inhabitants, besides Indians. The latter number about 32,000, of whom 5000 are settled on reservations. Those on the reservations, and some of the roving tribes, are friendly with the whites, but many are hostile, and of these the Apaches are the most numerous and warlike, comprising several tribes scattered over the middle and eastern part of the territory. Of the friendly Indians the most important are the Pima and Maricopa tribes on the Gila river. Near the Mexican border are the Papogos; on the Colorado are the Mohaves and Yumas, and the Utes are on the upper Colorado. The settled tribes are engaged in agriculture and stock-raising. In the northern part of the territory are a few Pueblo, or "town," Indians, called Moquis, who are, perhaps, the remnant of the once powerful Aztecs, though some suppose of a still earlier race. They are a quiet, inoffensive people, dwelling in stone houses, and enjoy many of the arts of civilization.

A. is a rough and elevated country of broad plateaus from 7000 to 7500 ft. above the sea in the n., but declining toward the s. to less than 100 feet. Mountain chains cross the plateaus, with summits and isolated peaks from 12,000 to 14,000 ft. high. The streams flowing southward have worn enormous gullies or canyons in their course, to a depth in some places of many thousands of feet. The great canyon of the Colorado is the

largest in the world, so far as known, being 400 m. long, with walls for the most part perpendicular and from 1500 to 6000 ft. high; while at the bottom of this chasm the river plunges and roars down cataracts and whirlpools that make extended navigation impossible, and even exploration very difficult and dangerous. The mountains are chiefly spurs and branches of the Rocky mountains, and range generally from n.e. to s.w. The main groups or ranges are the Castle Dome, in the s.w.; the Black and the Aquarius in the w.; the North Side in the n.w.; the Carizo and San Francisco in the n.; the Cata-moza in the n.e.; the Mongolon and Zuni in the e.; and in the n.e. the St. Catherine, the Pinaleno, and the Piloncello. There are also buttes, or solitary peaks, which rise to a great height; and in the n. there is a large table-land more than 1000 ft. above the plateau, known as the table-land of cows. Some of the mountains were once active volcanoes, but not within historical record. The mountains consist of granite and kindred rocks. The grand canyon of the Colorado shows most of the geological formations from the underlying granite to the upper carboniferous limestone.

The principal river is the Colorado, over 1200 m. long, rising in Utah, draining 300,000 sq. m., and falling into the northern end of the gulf of California. The Colorado forms the boundary between A. and the lower part of Nevada and the whole of California, entering A. in the center of its northern line, running s.w. about 70 m., then irregularly w. 1000 m. or more, and then nearly s. to its end. It receives 200 streams, chiefly small; runs 600 m. in deep canyons, and falls 3000 ft. from the northern to the southern line of the territory. The river is navigable from the mouth to the beginning of the Grand canyon, in Nevada, but the voyage is very difficult. The second river in point of size is the Gila, rising in New Mexico and flowing nearly w. across A., emptying into the Colorado not far above the mouth of the latter. The Gila has several tributaries, but none of much size, nor are any of them useful for navigation, though of great importance for irrigation and mining. Though much of the territory is occupied by mountains, high table-lands, and vast canyons, there is good soil, especially in the southern part around the Colorado and Gila, where the overflow fertilizes, and enormous crops are produced. The plateau in the s. and n.e. is well wooded, and the larger part of the territory is excellent for stock raising. The census of 1870 showed 14,585 acres of improved, and 7222 acres of unimproved land in farms, though settlement had scarcely begun, and the land cultivated by Indians was not reckoned. The climate is delightful in winter in the southern section, but cold in the northern, though frost and snow are unusual except on the mountains. The summer heat is intense in some places, particularly near the junction of the Colorado and Gila, where 120° in the shade, and 160° in the sun, have frequently been noted. In the north, however, the summer heat is seldom continuous for a long period. The rainy season is in June, July, Aug., and Sept., no rain falling in the other eight months; hence the importance of irrigation. There were, Jan. 1, 1879, 27½ m. of railroad in the territory, starting from Yuma, and designed ultimately to be a portion of the Southern Pacific route from the Mississippi to California. School age in A. is from 6 to 21; whole number of children, 2955, of whom 1213 were enrolled; average attendance, 900; 180 school days in the year; 20 teachers; income \$31,449, raised by a levy of 15 cents on each \$100 of taxable property in general, and 35 cents on each \$100 for the several counties. Value of school property, \$42,230.

ARK, a term in the Bible for three objects: Noah's A., the A. of bulrushes in which Moses was laid, and the A. of the Covenant (see ARK OF THE COVENANT, *ante*). Noah's A. was not a ship, but more like a barge, intended not to sail, but only to float. Its shape was that of a parallelogram, 300 cubits long, 50 wide, and 30 high; but the length of the cubit is unknown, and it is impossible to ascertain the dimensions of the craft. Dr. Robinson concludes that it was an oblong house of three stories, with a flat or slightly inclined roof, a door in the side, and one or more windows in the roof. Many nations have the common tradition of the preservation of their ancestors in an A., or some vessel which would float on the water. The A. of bulrushes was really of papyrus reed, of which Pliny says the Egyptians "weave boats;" such boats were light and noted for swiftness. The slime, with which the A. of B. was covered, was for the purpose of keeping out the water.

ARKANSAS, one of the larger states of the American Union, taking its name from the river A. Throughout its entire length, it occupies the right bank of the Mississippi, being separated by that stream, towards the e., from Tennessee and the n. half of Mississippi. Its boundaries to the s.w. and n. are purely arbitrary and conventional, and are best learned from a map. With a length of 240 m., and an average breadth of about 225, the area of A. is 52,198 sq. m., being pretty nearly the same as that of England proper. In 1870, out of the equivalent 33,406,720 acres, only 1,859,821 were cultivated, very little more than 1/7 of the whole, or than 1/4 of the lands liable to taxation as being allotted and occupied. The principal products of this cultivated land were 740,000 bushels of wheat, 13,382,145 bushels of Indian corn, 529,000 bushels of oats, and 247,968 bales of cotton. A. had in 1820 only 14,273 inhabitants; in 1870, the pop. was 484,471, of whom 122,169 were colored. Though nominally colonized by the French in 1685, it was still virtually a wilderness, when purchased as a part of Louisiana by the United States in 1803. It was only in 1819 and 1836 respectively that it became first a territory, and then a state of the union. The towns of A. are small, the principal being Little

Rock, the seat of government, with 12,380 inhabitants, which is about four times as populous as any other of the principal towns, which are, Camden, Fort Smith, Pine Bluff, Helena, Hot Springs, and Princeton.

In climate and productions A. occupies, as it were, an intermediate position between the states of the w. and those of the s. A. is rich in minerals, particularly in manganese, zinc, and gypsum. It also contains the principal varieties of coal—canal, anthracite, and bituminous. It likewise possesses lead-ores, which are said to contain a large proportion of silver. The manufactures of the state are comparatively insignificant.

The internal improvements of A. consist in great measure of plank-roads and levees or embankments against the Mississippi. In 1875, there were 810 m. of railway in A. The state, however, is comparatively independent of works of this description, penetrated as it is by so many navigable rivers—the A., the White river, the St. Francis, the Red river, the Washita, etc.

In 1870, the public indebtedness of A., contracted mainly in support of banks, amounted to \$4,151,152, nearly half of it representing "interest accrued and unpaid." The taxation for the same year was \$2,866,890, chiefly the result of a direct assessment on property of almost every description—lands, houses, furniture, horses, mules, cattle, stock-in-trade of all trades, gold watches, jewelry, etc.

The state legislature meets only once in two years. To the lower house of congress, A., in the proportion of its population, sends four representatives; while, like every other state, it has two senators in the upper house.

ARKANSAS (*ante*), one of the United States, the 12th in the order of accession after the original thirteen. The first white settlements within the bounds of the present state (which is a part of the Louisiana purchase of 1803) were made about 1670-80 by Frenchmen near the junction of the St. Francis river with the Mississippi. After Louisiana had been admitted as a state, the remainder of the purchase was organized as the territory of Missouri; and after Missouri applied to become a state, the territory of A., including the present Indian territory, was formed, Mar. 2, 1819. A state constitution was formed Mar. 1, 1836, and A. was admitted as a state June 15 of the same year. The name is from that of the chief river; the nick name is "Bear state." The boundary of A. is the Mississippi river up to 36°, where the n. boundary runs w. to the St. Francis river, and n. up that stream to the famous political line dividing free from slave territory or 36° 30' n.; thence directly w. to the s.w. corner of Missouri, and then s. on the line of the Indian territory, about 94° 30', to Red river; then e. a short distance with the river, then s. direct to the n. line of Louisiana 33°, and finally e. on that parallel to the Mississippi river. The area of A. is 52,198 sq. m. The surface in the e. is level and broken with swamps, bayous, and small lakes, large tracts being subject to overflow when the Mississippi is high. In the central portion are hilly and rolling lands, and w. and n.w. are wide prairies. There are no mountains of importance in the state; the Ozark hills rise 1500 to 2000 ft., and there are isolated peaks reaching 3000 ft. The Arkansas river crosses the state from n.w. to s.e., and is navigable throughout; the other rivers of the state are St. Francis, White, Big Black, Washita, and Saline. The Red river enters the s.w. corner, and for a short distance forms the boundary between A. and Texas. More than half the counties of A. are bordered or traversed by navigable streams, and the whole state is well watered. There are no lakes worth naming. The surface in the n. and w. is rolling and beautiful.

The search for precious metals in A. has not been successful; but there seems to be a large supply of lead, of paying quantity, in some places yielding 70 per cent of metal to the ton of ore, with 50 oz. of silver besides. There are also ores of copper, zinc, manganese, and iron, some of the latter ores being of the very best quality. Coal deposits underlie nearly 8,000,000 acres in the state, the coal being slightly bituminous and easily mined. Beds of lignite have been discovered; also pink and gray marble, slate of first quality, and the excellent Arkansas oil-stone. There are also grit, or millstone, and grindstone, porcelain clay, mineral ochers, granite and other building stone, salt, and marls. Mineral and medicinal springs are found, and the hot springs, at the town of that name, 60 m. s.w. from Little Rock, have a world-wide fame. There are more than 50 of them, varying in temperature from 93° to 148°, largely impregnated with carbonic acid and various alkalies and carbonates, and supposed to be of benefit in many chronic diseases. Similar springs are found in other places in the state, and in Fulton co. there is an immense fountain charged with carbonic acid or other effervescing substance, constantly in action and of even temperature (60°) at all seasons. This spring discharges about 15,000 bbls. of water every hour.

Except along the swampy grounds near the Mississippi, the climate of A. is pleasant and healthful. Malarial diseases occur, but the dreaded yellow fever, which so often devastates the eastern side of the Mississippi, is seldom violent in A. The greater part of the state is exceptionally salubrious, as the mortality records of the census show. Vegetation is prolific. There are large forests of cypress, oak, pine, red cedar, black-walnut, sassafras, locust, maple, and mulberry trees. The orange grows to great size. Besides these we find beech, sycamore, ash, elm, hickory, cotton-wood, hackberry, willow, holly, butternut, box-elder, plum, dogwood, palmetto, ironwood, laurel, juniper,

scrub oak, hazel, sumac, etc., and occasionally cane-brake. There are wild plums, haws, persimmons, pawpaws, whortleberries, and chinquapins. Of cultivated fruits peaches, apples, apricots, nectarines, cherries, grapes, strawberries, etc., abound. Corn and all the cereals are easily grown, and bring large returns; but cotton-raising is the leading business, and cotton is grown in all parts of the state. There are many varieties of native grasses, and hay is one of the most important crops.

A. has still much forest area, and game remains in large supply; such as the deer, bear, turkey, prairie-hen, and quail. Fish are plentiful in the streams and bayous, where very rarely an alligator may be found. In the lowlands are many reptiles, and moccasin and rattle snakes inhabit the hills in some sections.

The railroads in A. at the opening of 1879 were: the A. Midland, 48 m., Helena to Duncan and Clarendon; the Hot Springs, 25 m., Malvern to the springs; Little Rock and Fort Smith, 165 m., L. R. to F. S.; Little Rock, Mississippi River and Texas, 100 m., Arkopolis to Pine Bluff and Collins; Memphis and Little Rock, 133 m., Hopefield to L. R.; St. Louis, Iron Mountain and Southern, 304½ m., St. Louis to Texarkana on the Texas line. The Memphis and Little Rock railroad will be a part of the Southern Pacific, when that enterprise is completed.

Seventy-nine newspapers and magazines were published in A. at the beginning of 1879: 7 daily, 70 weekly, and 2 monthly. A. has 216,475 children of school age—6 to 21 years.—of whom 32,747 were enrolled in 1878. The school fund amounted to \$168,236; income, \$256,450; expenses, \$148,292. There were normal departments in the industrial university at Fayetteville, and in the university at Pine Bluff. There are four colleges in the state: Arkansas college, Presbyterian, Batesville; Cane Hill college, Cumberland, Presbyterian, Boonsboro; Judson university, Baptist, Judsonia; and St. John's college, non-sectarian, Little Rock. There is also an industrial university at Fayetteville. In all the colleges there were 35 instructors and 204 students. Both sexes are admitted to all except St. John's.

Probably no other of the states has less of written history than A. Doubtless the first European on its soil was De Soto, or some of his men, and there is a belief that the great explorer was buried in the Arkansas and not in the Mississippi. The Spaniards left no marks; they were searching for gold, and did not attempt to settle. The French, however, who came with or followed Bienville, made a settlement about 1680, near the junction of the St. Francis with the Mississippi. In 1720, Louis XV. granted to John Law, the notorious Scotch speculator, 12 sq. m. of land on the A. river, on condition that he would settle upon it 1500 German immigrants, and maintain at his own expense a sufficient force to protect them against the Indians. This was a small part of the famous "Mississippi scheme," but the settlement of Germans was not made; 200 Alsations came over, and 500 negroes were imported from Africa shortly before Law's failure, and they settled at Cote d'Or, 80 m. from New Orleans. It was long after the revolution that a permanent settlement was made within the bounds of A., which was French territory till 1803, and when the territory was organized, in Mar., 1819, by congress, the entire pop., excluding Indians, was less than 1000. But even then the printing press was on its way, and in Nov., 1819, the *Arkansas Gazette* was started at Little Rock.

A. was one of the first of the seceding states, voting for a convention on the subject in Jan., 1861; in favor, 27,412; opposed, 15,826. The state officers anticipated the business by seizing upon fort Smith and the federal arsenal, at Napoleon and Little Rock. In May, 1861, the convention adopted, with but one negative vote, an ordinance of secession, but did not submit it to the popular vote. The confederates were defeated at the battle of Pea Ridge in Mar., 1862, and again, under Hindman, Dec. 7, 1862, at Prairie Grove. The union forces captured Arkansas Post, Jan. 11, and Little Rock, Sept. 10, 1863. A diversion against the rebellion was made in 1864, when nearly two thirds of the counties in the state were represented in a convention at Little Rock. A constitution was adopted and voted upon a few weeks later, 12,177 being for it, and 226 opposed. Congressmen and local officers were chosen, and a regular state government was organized in April. In this manner, A. practically returned to the union a year before the end of the rebellion. Under the reconstruction acts, a convention to frame a constitution was elected in Nov., 1867, and in the following Mar. the present constitution was indorsed by a small majority of the popular vote. Near the close of 1868, several counties were declared to be in insurrection, and were put under military rule, in consequence of the frequency of outrages upon individuals.

The state capital is at Little Rock; the governor is chosen for two years, and has a salary of \$3500 per year. Legislative sessions are biennial, and limited to 60 days. The three electoral votes of A. were given first in 1836 and 1840 for Van Buren and Johnson; 1844, for Polk and Dallas; 1849, for Cass and Butler; 1852 (4 votes), for Pierce and King; 1856, for Buchanan and Breckenridge; 1860, for Breckenridge and Lane; 1864, no vote; 1868 (5 votes), for Grant and Colfax; 1872 (6 votes, not counted); 1876, for Tilden and Hendricks.

ARKAN'SAS, a co. in Arkansas, on the Arkansas and White rivers; 1260 sq. m.; pop. '70, 8268—4212 colored. It is level, with good prairie and river lands, producing corn and cotton. Co. seat, De Witt.

**ARKAN'SAS RIVER**, next to the Missouri the largest affluent of the Mississippi. It is 2000 m. long, rising in the Rocky mountains on the borders of Utah, and joining the "father of waters" in lat.  $33^{\circ} 54'$  n., and long.  $91^{\circ} 10'$  w. Flowing generally through a level country, it presents but few obstacles to navigation. The principal difficulty is connected with its periodical rise and fall—the difference between season and season being not less than 25 ft. Notwithstanding this, however, the A. is practicable for steamboats, during nine months of the year, to a distance of 800 m. from its mouth. It divides the state which takes its name into nearly equal parts, varying in breadth within the limits of the same from three furlongs to half a mile. Its banks also, in its lower course, contain a good deal of stone-coal.

**ARK'LOW**, a seaport t. in the s.e. corner of Wicklow co., in lat.  $43^{\circ} 40'$  n., and long.  $4^{\circ} 38'$  w., at the mouth of the river Avoca, which is crossed here by a bridge of 19 arches. It consists of an upper well-built t., and a lower, inhabited by fishermen. Two hundred boats are employed in the herring and oyster fishery. Near the town is Shelton abbey, the seat of the earl of Wicklow. Sand-banks unfit the harbor for ships of any size, and extensive sand-dunes exist on the adjacent coast. In 1798, a bloody encounter took place here between the royal troops and the united Irishmen. Pop. '71, 5178.

**ARK OF THE COVENANT**, **ARK OF THE TESTIMONY**, or **ARK OF JEHOVAH**, one of the most important parts of the furniture of the tabernacle, which, by divine direction, the Israelites constructed in the wilderness, and afterwards of the temple built by Solomon at Jerusalem. A description of it is to be found in Exodus xxv., in the command given to Moses for its construction; and also in Exodus xxxvii., from which it appears that it was a chest of shittim-wood (very generally supposed to be the wood of a species of acacia, but by some regarded as more probably that of the wild-olive), overlaid with gold within and without, two cubits and a half in length, one cubit and a half in breadth and in height—that is, according to the common estimate of the length of the cubit, 3 ft. 9 in. in length, and 2 ft. 3 in. in breadth and height—the lid being formed entirely of pure gold, with a crown or raised border of gold round about. Within the ark was deposited the "testimony," consisting of "the two tables of the law," i.e., the stone tablets upon which the ten commandments were inscribed. The golden lid of the ark was called the *mercy-seat* or *propitiatory*, and above it were the *cherubims* (q.v.), made of the same piece of gold with it, and between them was the place of the *Shechinah* or manifestation of the divine presence. The ark had also golden rings, through which passed staves of shittim-wood, overlaid with gold, for carrying it in the journeyings of the Israelites, concerning which very particular rules were laid down (see Numbers iv.). Whilst being carried from one place to another, it was covered first with a "covering of badgers' skins," and above this with "a cloth wholly of blue;" and in the tabernacle and temple it was put into the "most holy place," into which the high-priest alone was to enter upon the "day of atonement." The ark was called the A. of the C., because it was the appointed symbol of the presence of God as the God of Israel, and of his covenant with his people. The things of the Jewish dispensation being regarded as typical, and the Jewish religion as essentially one with the Christian, the ark is commonly regarded as a type of Christ; the excellency and unchangeableness of the moral law, as indicated by the place assigned to it within the ark, which, however, sprinkled with the blood of typical sacrifice, was interposed between it and men, who, having transgressed it, were exposed to its curse; and the mercy-seat, in like manner sprinkled with the blood of sacrifice, was interposed, as it were, between the law and God, who is represented in the Old Testament as "dwelling between the cherubims," and thence shining forth as the God of mercy, favorable to his worshippers. A complete harmony is thus made out between these Old Testament types and Christian theology.—It is worthy also of notice that sacred arks or chests have been connected with the worship of various heathen nations, and have been placed as the most sacred things in the innermost parts of the temple, which only the priests were permitted to enter. The relation of these to the ark of the Jews has been the subject of much learned inquiry, but has not yet received thorough and satisfactory elucidation.—The ark appears not to have been brought back from Babylon, and so never to have been in the second temple. No figure of it appears among the sacred vessels of the temple represented on the arch of Titus.

**ARKONA**, the n.e. promontory of the island of Rügen, in the Baltic, almost the most northern extremity of Germany. Its steep cliffs mainly consist of mixed chalk and loam, with horizontal veins of flint. There is a small deposit of pure chalk towards the e. Myriads of sand-martins build in the clefts of these cliffs. The view from their summit extends to the coast of Jasmund on the right, on the left to the islands of Hiddensee and Möen. The name A. is very ancient. In the chronicles of Saxo Grammaticus we find it written Archona, but its derivation is quite uncertain. On the w. side is the famous wall or fortified inclosure in which stood the temple of the Wend deity Swantevit. King Waldemar I. of Denmark, after a bloody conflict, took possession of the fortress in 1168, burnt the idol and its temple, and carried away its treasures to Denmark. On its site, a lighthouse, 75 ft. high, was built in 1827.

**ARKWRIGHT**, Sir RICHARD, celebrated for his inventions in cotton-spinning, was b. at Preston, in Lancashire, Dec. 23, 1732. Of humble origin, the youngest of 15 children, and bred to the trade of a barber, his early opportunities of cultivation were exceedingly limited. In 1760, he gave up his business as a barber in Bolton, and became a dealer in hair. A secret process for dyeing hair, said to have been discovered by himself, increased considerably the profits of his trade. Very little is known regarding the first movements of his mind in the direction of mechanical invention. His residence in the midst of a cotton-spinning population naturally led him to take an interest in the processes used in that manufacture. That the development of his mechanical ingenuity was not, however, due to circumstances, is sufficiently proved by the fact that his first effort was an attempt to discover the perpetual motion. Having no practical skill in mechanics, he secured the services of a watchmaker, named Kay, to assist him in the construction of his apparatus. About 1767, he seems to have given himself wholly up to inventions in cotton-spinning. In the following year he removed to Preston, where he set up his first machine, the celebrated *spinning-frame*, consisting chiefly of two pairs of rollers, the first pair moving slowly in contact, and passing the cotton to the other pair, which revolved with such increased velocity as to draw out the thread to the required degree of fineness. No previously invented machinery had been able to produce cotton thread of sufficient tenuity and strength to be used as warp. An invention, indeed, by Mr. Charles Wyatt of Birmingham, which was patented in 1738, but never succeeded, deprives A. of the honor of having been the first to use rollers in spinning; but there is no reason to believe that he owed anything to this previous attempt. The first suggestion of the idea, he said, was derived from seeing a red-hot iron bar elongated by being made to pass between rollers. At this time A. was so poor that he needed to be furnished with a suit of clothes before he could appear to vote at an election as a Burgess of Preston. Soon after, he removed to Nottingham, to escape the popular rage, which had already driven Hargreaves, the inventor of the *spinning-jenny*, out of Lancashire. Here he fortunately fell in with Mr. Jedidiah Strutt of Derby, the celebrated improver of the *stocking-frame*, who entered into partnership with him, in conjunction with his partner Mr. Need. In 1769, A. set up his first mill, driven by horses, and took out a patent for his invention. In 1771, he set up a larger factory, with water-power, at Cromford, in Derbyshire. The remarkable capabilities of his mind were strikingly evinced in the management of the great business which now demanded his undivided attention. Without personal experience, and with no model to guide him, he introduced a system of management so admirable that it was afterwards universally adopted, and has never been materially improved. In 1775, he took out a fresh patent for various additional improvements in machinery. The success attending these undertakings stimulated rivals to invade his patent; and to such an extent did other cotton-spinners use his designs, that he was obliged, in 1781, to prosecute at once nine different manufacturers. The first action against col. Mordaunt, backed by a strong combination of Lancashire manufacturers, was lost, solely on the ground that his description in his specification was not sufficiently clear and distinct. The other actions were abandoned; and, in the following year, A. published a pamphlet containing a statement of his case. In a new trial, in 1785, he obtained a favorable verdict. The whole question, however, was brought finally before the court of king's bench, a few months after, when A.'s claim to the inventions patented was for the first time called into dispute. On the doubtful evidence of a person named Highs, or Hayes, combined with that of A.'s old assistant Kay, the jury decided against him, and his patent was annulled. This was but the formal outcome of an opposition which had from the beginning marked out A. as an object of hostility. The manufacturers at first combined to discountenance the use of his yarn. When the yarn was made into calicoes, and parliament was petitioned to lessen the duty on that cloth, they strenuously opposed the measure, but in vain. Popular animosity was also excited against the man who abridged labor, but in reality increased its sphere; and on one occasion, a large factory belonging to A. was destroyed in the presence of a powerful military and police force, without a word of interference from the magistrates. The energy and good sense of A., however, triumphed over all opposition; and at the time of his death, in 1792, the value of his property amounted to about half a million sterling. In 1786, he was appointed high-sheriff of Derbyshire; and on the occasion of presenting an address to the king, congratulating him on his escape from the knife of the maniac Margaret Nicholson, he received the well-merited honor of knighthood. A severe asthma had pressed upon him from his youth; and a complication of disorders, the result of his busy sedentary life, terminated his honorable career at the comparatively early age of 60.

**ARLES** (anciently, Arelate), one of the oldest towns in France, situated on the left bank of the principal branch of the Rhone, after it has divided into a delta, in the department of Bouches du Rhone. Pop., '73, of the municipality, 23,997; of the town, 15,120. A. carries on a considerable trade. It has manufactures of silk, hats, tobacco, brandy, etc., and forms a market for the productions of the surrounding country. It also possesses a college, a naval school, a public library, and a superb museum of antiquities in natural history. The marshes which rendered the district so unhealthy for a long time, have been considerably drained, and a canal has been formed which connects it with the south coast. Railways also bring it into easy communication with Marseille, Avignon, Nimes, Montpellier, etc. Under the Romans it was the seat of a prefect; afterwards, for

some time, the residence of the Gothic king, Eurich; and, in 879, was the metropolis of the kingdom of Arlate (see BURGUNDY). In the early Christian times, several important synods were convened here (314, 354, 452, and 475 A.D.). Among the antiquities of A. are a magnificent amphitheatre, which could contain between 20,000 and 30,000 spectators; the ruins of a theater, also of a palace of Constantine the great; an obelisk of granite, dug up from the mud of the Rhone in 1389; a burial-place (the Elysian Fields) used by the Romans; and a mediæval cathedral, in the old Roman style, with a splendid portal arch.

**ARLINCOURT**, Victor, Viscount d', 1789-1856; a French author. He wrote *Charlemagne, ou la Caroleide*, an epic poem; and *Le Solitaire*, a novel; both moderately successful.

**ARLINGTON**, a t. in Massachusetts, 7 m. n.w. of Boston, with which it has connection by steam and horse railroads. Market gardening and ice-cutting are leading occupations. A. is an attractive suburban t., and has a public library, a savings bank, five or six churches, a newspaper, and some manufacturing business. It was formerly called West Cambridge. Pop. '80, 4,100.

**ARLON** (anc. *Orolanum*), a t. of Belgium, the capital of the province of Luxemburg, 24 m. w.n.w. from Luxemburg. It is a neat and prosperous town, and has a considerable trade in corn, woolen stuffs, leather, iron, etc. It has frequently suffered the ravages of war. The French pillaged it in 1793, after a victory won in its neighborhood over the Austrians. Pop. '70, about 5800.

**ARM**, the upper extremity of the human body, consists of two portions — the A. strictly so called, and the forearm; the former having one bone, the humerus, which moves freely by a globular head upon the scapula, forming the shoulder-joint; and the latter having two bones, the radius and ulna, which move on the lower end of the humerus, forming the elbow-joint, and below, with the carpus, forming the wrist.

The humerus is attached by a loose capsular ligament to the scapula, allowing great freedom of motion; and were it not for the muscles, would be frequently dislocated, but it is supported by muscles on all sides except underneath or opposite the armpit, into which the head of the bone is often driven. The roundness of the shoulder is due to the head of the humerus, so that any displacement is accompanied by a flattening, which at once suggests the nature of the accident. On the shoulder there is a large triangular muscle, the deltoid, which lifts the A. from the side. At the back is the triceps, which extends the forearm; in front are two muscles which flex or bend it — the biceps, and the brachialis anticus; and on each side below are muscles passing to the forearm and hand; while on each side, above the great muscle of the back (latissimus dorsi) and that of the chest (the pectoralis major) are inserted on each side of a groove, wherein lies one of the tendons of the biceps (q.v.). The motions of the ulna are flexion or bending effected by the biceps, and extension or straightening by the brachialis anticus and the triceps, its projections D and A being received in these movements into corresponding depressions on the humerus. The movements of the hand are principally due to the radius, the head of which rolls at C and H upon the ulna at F and L, thereby turning the palm downwards (pronation), or restoring the palm upwards (supination), these movements being effected by muscles, two for each movement, which, taking their fixed points from the humerus and ulna, pull the radius round on the latter. The elbow-joint is ginglymoid or hinge-like, and therefore has strong lateral ligaments; but it is extremely liable to dislocations, often accompanied by fracture, especially in the young. The accident being followed by severe inflammation, the joint is very apt to stiffen, thereby seriously (see ANKYLOSIS) deteriorating from the usefulness of the limb; it is, therefore, inadvisable to keep the limb too long in any one position after such an injury. This joint is also very liable to disease; but as this is confined to the ends of the bones, the small portions of the latter affected can be readily cut out, and the arm be restored to usefulness and mobility in a few weeks.

The upper extremity is supplied with blood by the brachial artery, the continuation of the axillary trunk. The veins collect into large superficial trunks, which unite at the bend of the elbow, at which situation one is frequently selected for venesection, and then pass on to the axillary, on the outside by the cephalic vein, on the inner side by the basilic.

HUMAN ARM.

*abc*, deltoid muscle; *d*, coraco-brachialis muscle; *e*, *f*, triceps; *g*, *h*, *i*, *k*, *l*, *m*, *n*, *o*, *p*, *q*, *r*, *s*, *t*, *u*, *v*, *w*, *x*, *y*, *z*, *aa*, *ab*, *ac*, *ad*, *ae*, *af*, *ag*, *ah*, *ai*, *aj*, *ak*, *al*, *am*, *an*, *ao*, *ap*, *aq*, *ar*, *as*, *at*, *au*, *av*, *aw*, *ax*, *ay*, *az*, *ba*, *bb*, *bc*, *bd*, *be*, *bf*, *bg*, *bh*, *bi*, *bj*, *bk*, *bl*, *bm*, *bn*, *bo*, *bp*, *bq*, *br*, *bs*, *bt*, *bu*, *bv*, *bw*, *bx*, *by*, *bz*, *ca*, *cb*, *cc*, *cd*, *ce*, *cf*, *cg*, *ch*, *ci*, *cj*, *ck*, *cl*, *cm*, *cn*, *co*, *cp*, *cq*, *cr*, *cs*, *ct*, *cu*, *cv*, *cw*, *cx*, *cy*, *cz*, *da*, *db*, *dc*, *dd*, *de*, *df*, *dg*, *dh*, *di*, *dj*, *dk*, *dl*, *dm*, *dn*, *do*, *dp*, *dq*, *dr*, *ds*, *dt*, *du*, *dv*, *dw*, *dx*, *dy*, *dz*, *ea*, *eb*, *ec*, *ed*, *ee*, *ef*, *eg*, *eh*, *ei*, *ej*, *ek*, *el*, *em*, *en*, *eo*, *ep*, *eq*, *er*, *es*, *et*, *eu*, *ev*, *ew*, *ex*, *ey*, *ez*, *fa*, *fb*, *fc*, *fd*, *fe*, *ff*, *fg*, *fh*, *fi*, *fj*, *fk*, *fl*, *fm*, *fn*, *fo*, *fp*, *fq*, *fr*, *fs*, *ft*, *fu*, *fv*, *fw*, *fx*, *fy*, *fz*, *ga*, *gb*, *gc*, *gd*, *ge*, *gf*, *gg*, *gh*, *gi*, *gj*, *gk*, *gl*, *gm*, *gn*, *go*, *gp*, *gq*, *gr*, *gs*, *gt*, *gu*, *gv*, *gw*, *gx*, *gy*, *gz*, *ha*, *hb*, *hc*, *hd*, *he*, *hf*, *hg*, *hh*, *hi*, *hj*, *hk*, *hl*, *hm*, *hn*, *ho*, *hp*, *hq*, *hr*, *hs*, *ht*, *hu*, *hv*, *hw*, *hx*, *hy*, *hz*, *ia*, *ib*, *ic*, *id*, *ie*, *if*, *ig*, *ih*, *ii*, *ij*, *ik*, *il*, *im*, *in*, *io*, *ip*, *iq*, *ir*, *is*, *it*, *iu*, *iv*, *iw*, *ix*, *iy*, *iz*, *ja*, *jb*, *jc*, *jd*, *je*, *jf*, *jj*, *jk*, *jl*, *jm*, *jn*, *jo*, *jp*, *jq*, *jr*, *js*, *jt*, *ju*, *jv*, *jw*, *jx*, *jy*, *jz*, *ka*, *kb*, *kc*, *kd*, *ke*, *kf*, *kg*, *kh*, *ki*, *kj*, *kl*, *km*, *kn*, *ko*, *kp*, *kq*, *kr*, *ks*, *kt*, *ku*, *kv*, *kw*, *kx*, *ky*, *kz*, *la*, *lb*, *lc*, *ld*, *le*, *lf*, *lg*, *lh*, *li*, *lj*, *lk*, *ll*, *lm*, *ln*, *lo*, *lp*, *lq*, *lr*, *ls*, *lt*, *lu*, *lv*, *lw*, *lx*, *ly*, *lz*, *ma*, *mb*, *mc*, *md*, *me*, *mf*, *mg*, *mh*, *mi*, *mj*, *mk*, *ml*, *mm*, *mn*, *mo*, *mp*, *mq*, *mr*, *ms*, *mt*, *mu*, *mv*, *mw*, *mx*, *my*, *mz*, *na*, *nb*, *nc*, *nd*, *ne*, *nf*, *ng*, *nh*, *ni*, *nj*, *nk*, *nl*, *nm*, *nn*, *no*, *np*, *nq*, *nr*, *ns*, *nt*, *nu*, *nv*, *nw*, *nx*, *ny*, *nz*, *oa*, *ob*, *oc*, *od*, *oe*, *of*, *og*, *oh*, *oi*, *oj*, *ok*, *ol*, *om*, *on*, *oo*, *op*, *oq*, *or*, *os*, *ot*, *ou*, *ov*, *ow*, *ox*, *oy*, *oz*, *pa*, *pb*, *pc*, *pd*, *pe*, *pf*, *pg*, *ph*, *pi*, *pj*, *pk*, *pl*, *pm*, *pn*, *po*, *pp*, *pq*, *pr*, *ps*, *pt*, *pu*, *pv*, *pw*, *px*, *py*, *pz*, *qa*, *qb*, *qc*, *qd*, *qe*, *qf*, *qg*, *qh*, *qi*, *qj*, *qk*, *ql*, *qm*, *qn*, *qo*, *qp*, *qq*, *qr*, *qs*, *qt*, *qu*, *qv*, *qw*, *qx*, *qy*, *qz*, *ra*, *rb*, *rc*, *rd*, *re*, *rf*, *rg*, *rh*, *ri*, *rj*, *rk*, *rl*, *rm*, *rn*, *ro*, *rp*, *rq*, *rr*, *rs*, *rt*, *ru*, *rv*, *rw*, *rx*, *ry*, *rz*, *sa*, *sb*, *sc*, *sd*, *se*, *sf*, *sg*, *sh*, *si*, *sj*, *sk*, *sl*, *sm*, *sn*, *so*, *sp*, *sq*, *sr*, *ss*, *st*, *su*, *sv*, *sw*, *sx*, *sy*, *sz*, *ta*, *tb*, *tc*, *td*, *te*, *tf*, *tg*, *th*, *ti*, *tj*, *tk*, *tl*, *tm*, *tn*, *to*, *tp*, *tq*, *tr*, *ts*, *tt*, *tu*, *tv*, *tw*, *tx*, *ty*, *tz*, *ua*, *ub*, *uc*, *ud*, *ue*, *uf*, *ug*, *uh*, *ui*, *uj*, *uk*, *ul*, *um*, *un*, *uo*, *up*, *uq*, *ur*, *us*, *ut*, *uu*, *uv*, *uw*, *ux*, *uy*, *uz*, *va*, *vb*, *vc*, *vd*, *ve*, *vf*, *vg*, *vh*, *vi*, *vj*, *vk*, *vl*, *vm*, *vn*, *vo*, *vp*, *vq*, *vr*, *vs*, *vt*, *vu*, *vv*, *vw*, *vx*, *vy*, *vz*, *wa*, *wb*, *wc*, *wd*, *we*, *wf*, *wg*, *wh*, *wi*, *wj*, *wk*, *wl*, *wm*, *wn*, *wo*, *wp*, *wq*, *wr*, *ws*, *wt*, *wu*, *wv*, *ww*, *wx*, *wy*, *wz*, *xa*, *xb*, *xc*, *xd*, *xe*, *xf*, *xg*, *xh*, *xi*, *xj*, *xk*, *xl*, *xm*, *xn*, *xo*, *xp*, *xq*, *xr*, *xs*, *xt*, *xu*, *xv*, *xw*, *xx*, *xy*, *xz*, *ya*, *yb*, *yc*, *yd*, *ye*, *yf*, *yg*, *yh*, *yi*, *yj*, *yk*, *yl*, *ym*, *yn*, *yo*, *yp*, *yq*, *yr*, *ys*, *yt*, *yu*, *yv*, *yw*, *yx*, *yy*, *yz*, *za*, *zb*, *zc*, *zd*, *ze*, *zf*, *zg*, *zh*, *zi*, *zj*, *zk*, *zl*, *zm*, *zn*, *zo*, *zp*, *zq*, *zr*, *zs*, *zt*, *zu*, *zv*, *zw*, *zx*, *zy*, *zz*.

The nerves pass down as large cords by the side of the artery, and diverge from it to their ultimate distributions; the musculo-spiral soon passing round at the back to appear on the outside, and become the radial and posterior interosseous nerves; the ulnar running behind the internal condyle, N, for which it has obtained the term "funny bone," from the electric-like thrill which passes along the arm when the nerve is struck or pressed. The median, as its name implies, keeps a middle course with the artery.

In wounds of the forearm, the bleeding is often excessive, but may be at once controlled by pressure on the brachial artery, on the inner side of the biceps.

The arm affords excellent illustrations of some of the principles of mechanics. The insertion of the muscles so near, as will be seen, to the fulcra or centers of motion, involves a loss of power in the usual sense of the word; there is, however, a corresponding gain in velocity at the end of the lever; and for most of the purposes to which the hand is put, agility is of far greater moment than dead strength.

**ARM.** In maritime language, besides the obvious application to weapons of warfare, this term is applied to each extremity of a bibb, or bracket, attached to the mast of a ship for supporting the trestle-trees. The same name is also given to a part of the anchor. See **ANCHOR**.—In military language, the infantry, the cavalry, the artillery, and the engineers are each called "an A." of the service—equivalent to branch or department.

**ARMADA**, a Spanish word signifying simply an armed force, but applied especially to the great Spanish fleet which invaded England in 1588. The king of Spain, Philip II., had resolved to strike a decisive blow at the Protestant interest, by conquering England, which pope Sixtus V. had made over to him. The ports of Spain, Portugal, and other maritime dominions belonging to him, had long resounded with the noise of his preparations, and the most eminent Catholic soldiers from all parts of Europe flocked to take a share in the expedition. The marquis of Santa-Croce, a sea officer of great reputation and experience, was destined to command the fleet, which consisted of 130 vessels, of greater size than any that had been hitherto seen in Europe. The duke of Parma was to conduct the land forces, 20,000 of whom were on board the ships of war, and 34,000 more were assembled in the Netherlands, ready to be transported into England; so that, as no doubt was entertained of success, the fleet was ostentatiously styled the invincible A. Nothing could exceed the terror and consternation which seized all ranks of people in England upon the news of this terrible A. being under sail to invade them. A squadron of not more than thirty ships of the line, and those very small in comparison, was all that Elizabeth had to oppose it by sea; and it was considered impossible to make any effectual resistance by land, as the Spanish army was composed of men well disciplined and long inured to danger. But although the English fleet was much inferior in number and size of shipping to that of the enemy, it was much more manageable, while the dexterity and courage of the mariners were greatly superior. Lord Howard of Effingham, a man of great valor and capacity, took upon him, as lord high admiral, the command of the navy; Drake, Hawkins, and Frobisher, the most renowned seamen in Europe, served under him; while another squadron, consisting of 40 vessels, English and Flemish, commanded by lord Seymour, lay off Dunkirk, in order to intercept the duke of Parma. Such was the preparation made by the English; while all the Protestant powers of Europe regarded this enterprise as the critical event which was to decide forever the fate of their religion. In the meantime, while the Spanish A. was preparing to sail, the admiral, Santa-Croce, died, as likewise the vice-admiral, Paliano; and the command of the expedition was given to the duke of Medina Sidonia, a person utterly inexperienced in sea affairs; these unexpected circumstances served, in some measure, to frustrate the design. Some other accidents also contributed to its failure. Upon leaving the port of Lisbon, the A. next day met with a violent tempest, which sank some of the smallest of the ships, and obliged the rest to put back into the harbor. After some time spent in refitting, the Spaniards again put to sea, where they took a fisherman, who gave them intelligence that the English fleet, hearing of the dispersion of the A. in a storm, had returned to Plymouth, and that most of the mariners were discharged. From this false intelligence, the Spanish admiral, instead of going to the coast of Flanders, to take in the troops stationed there, resolved to sail directly to Plymouth, and destroy the shipping laid up in the harbor. But Effingham was very well prepared to receive him, and had just got out of port, when he saw the Spanish A. coming full sail towards him, disposed in the form of a half-moon, and stretching seven miles from the one extremity to the other. The English admiral, seconded by Drake, Hawkins, and Frobisher, attacked the Spaniards at a distance, pouring in their broadsides with admirable dexterity. They did not choose to engage the enemy more closely, because they were greatly inferior in number of ships and guns, as well as in weight of metal; nor could they pretend to board such lofty vessels without manifest disadvantage. In this action, however, two Spanish galleons were disabled and taken. As the A. advanced up the channel, the English still followed and infested its rear; and as their ships continually increased from different ports, they soon found themselves in a capacity to attack the Spanish fleet more nearly, and accordingly fell upon them while they were taking shelter in the port of Calais. To increase their confusion, Howard selected eight of his smaller vessels, which, after filling them with combustible materials, he sent one after another, as if they had been fire-ships, into the midst of the enemy. The Spaniards,

taking them for what they seemed to be, immediately bore off in great disorder; while the English, profiting by their panic, captured or destroyed about twelve ships. The duke of Medina Sidonia, being thus driven to the coast of Zealand, held a council of war, in which it was resolved that, as their ammunition began to fail, as their fleet had received great damage, and as the duke of Parma had refused to venture his army under their protection, they should return to Spain by sailing round the Orkneys, as the winds were contrary to their passage directly back. Accordingly, they proceeded northward, and were followed by the English fleet as far as Flamborough Head, where they were terribly shattered by a storm. Seventeen of the ships, having 5000 men on board, were afterwards cast away on the Western isles and the coast of Ireland. Of the whole A., 53 ships only returned to Spain, and these in a wretched condition. The seamen, as well as the soldiers who remained, were so overcome with hardships and fatigue, and so dispirited by their discomfiture, that they filled all Spain with accounts of the desperate valor of the English, and of the tempestuous violence of that ocean by which they were surrounded.

**ARMADILLO**, *Dasypus*, a genus of mammalia of the order *edentata* (i.e., toothless)—not, however, truly toothless, but having feeble teeth destitute of true roots, and set apart from each other, and so that those of the one jaw fit into the interstices of those of the other. The number of the teeth is different in different species. The muzzle is elongated, and the tongue smooth and slender, with a glutinous saliva, adapted to the capture of ants and other insects, after the manner of the ant-eaters, but not long and extensile, like theirs. The limbs are short and strong, as are also the claws, and the animals have a great aptitude for digging and burrowing, by means of which they seek to shelter themselves from enemies—burrowing in sand or soft earth with such rapidity that it is almost impossible to dig them out, and indeed it can only be done by persevering till they are exhausted. But that which peculiarly distinguishes the A., and in which this genus differs from all the other mammalia, except the *chlamyphorus* (q.v.), is the bony armor with which the body is covered, and which consists of polygonal plates not articulated, united on the head to form a solid covering, and similarly to form solid bucklers over the shoulders and the haunches; and between these, disposed in transverse bands, which allow of freedom of motion to the body, similar bands in most species protecting also the tail. Armadillos feed not only on insects, but on vegetable and animal food of almost every kind, which by decomposition or otherwise has acquired a sufficient softness. Some of them prefer vegetable food, others delight chiefly in carrion. They are all natives of the warm and temperate parts of South America, in the woods and pampas of which they are found in immense numbers. They are timid and inoffensive, although, when they are incautiously assailed, injury may be received from their claws. Their flesh is esteemed a delicacy, particularly that of the species which feed chiefly on vegetable food. The largest species is fully 3 ft. long, exclusive of the tail; the smallest not above 10 in. The species are numerous, and the genus has been divided into a number of sub-genera, which some naturalists elevate into genera, naming the family *loricata* (i.e., mailed). To this family belongs also the genus *chlamyphorus*, also South American. Fossil remains of gigantic extinct armadillos have been found in the pleistocene strata of South America, forming the genus *glyptodon* of Owen, so named from the fluted teeth.

**ARMADILLO** is also the scientific name of a genus of *crustacea* of the order *isopoda* of Cuvier. This is one of the genera usually included under the popular name of woodlouse, and one of which (*porcellio*) is very generally known by that of slater. The armadillos derive their name from the scaly armor of their body, in which an analogy is found to the mailed quadrupeds of South America. They have, in a remarkable degree, the power of rolling themselves into a ball, when alarmed, so as to expose nothing but the plates of the back, and have thence received the name of pill beetles. Like some of the other closely allied *isopoda*, they were at one time reputed to possess medicinal virtues, now accounted merely imaginary. They were not only used in a dried and pulverized state, but they are said to have been actually swallowed entire as pills. *A. vulgaris* is not uncommon in damp places, under stones, etc., in Britain.

**ARMAGED'DON**, the name given to the whole or part of the great plain of Esdraelon, which was famous among the Israelites for two great victories—of Barak over the Canaanites, and of Gideon over the Midianites; and for two serious disasters—the death of Saul in battle with the Philistines, and the death of Josiah during an Egyptian invasion. The battles of Gilboa and Megiddo, of Kishon and Jezreel, were fought on this plain. In all history A. has been a famous battle ground from the time of the wars between Assyria and Egypt down to Napoleon's eastern campaign; thence the seer in the book of the Revelation used the name as symbolical of the scene of "the great day of the Almighty," or of the tremendous final conflict between good and evil.

**ARMAGH**, a small inland co. in Ulster, Ireland; bounded n. by Lough Neagh, e. by Down, s. by Louth, w. by Monaghan and Tyrone. Its greatest length is 32 m., and breadth 20. Area, 512½ sq. m., about four fifths being arable, and a 36th part in woods. The surface is hilly in the s. and undulating in the center, attaining in Slieve Gullion, in the s.w., the height of 1893 feet. The other chief heights are the Newry mountains, 1385 ft.; the Armagh-breague hills, 1200; and Muli-yash, 1034. The country bordering upon Lough

Neagh is low and boggy, and the Lough plain extends into the s. end of A. The principal rivers navigable in their lower parts are the upper Bann, flowing out of Down n.w. for 11 m. before it enters Lough Neagh; and the Blackwater, which in its lower part separates A. from Monaghan. The rocks of A. are lower silurian in the s. and middle of the co.; the trap of Antrim with the underlying greensand around Portadown; carboniferous limestone in the basins of the Blackwater, and its tributary the Callan; granite in the mountains of the s.e.; and tertiary strata bordering Lough Neagh. The soil is fertile except in the southern extremities. In 1875, 168,893 acres were in crop, the principal crops being oats, potatoes, wheat, turnips, and flax. The stock in that year was 12,573 horses, 82,614 cattle, 14,974 sheep, 25,064 pigs. The n. and central parts of A. exhibit a dense population, low hills cultivated to the tops, hedgerows, orchards, and thickly-scattered farm steadings. The co. is mostly in the diocese of Armagh. It returns three members of parliament—two for the co., and one for the city. The chief towns are A., Lurgan, Portadown, and Newry. Pop. '71, 179,260, of whom 85,057 are Roman Catholics, 58,343 Episcopalians, and 23,344 Presbyterians. The national schools had 33,693 pupils on the roll in 1875.

**ARMAGH**, the capital of the co. of A., in a carboniferous limestone district in the n.w. of the county. It is situated around and on a gentle eminence, hence its original name, Ard-Magha, "the high field." It is built of limestone. The cathedral is built of red sandstone, and is cruciform—184 by 119 ft.—and is supposed to occupy the site of that erected by St. Patrick in the 5th century. It has recently been repaired, chiefly at the cost (£10,000) of the late lord primate, lord Beresford. A Gothic Roman Catholic cathedral occupies the principal height to the n., and the primatial palace that to the s. There is a fever hospital for forty patients, maintained by the late primate, and a lunatic asylum for four counties. A. is the seat of the archiepiscopal see of the primate and metropolitan of all Ireland, who, before the disestablishment of the Irish church, had an income of £12,087 a year. Pop. in '71, 8946, of whom 4691 were Roman Catholics, 3020 Episcopalians, 918 Presbyterians, and the rest of other denominations. The chief manufacture is linen-weaving. A., from the year 495 to the 9th c., was the metropolis of Ireland, the native kings living at Eamania, 2 m. to the w. of the city. It was then renowned as a school of theology and literature—its college being the first in Europe. After the reformation, it suffered severely in the conflicts between the English and Irish; and it contained only three slated houses in 1765.

**ARMAGNAC**, *Ager Aremonicus*, the old name of a district in the s. of France, which at one time seems to have extended from the valleys of the Pyrenees to the Garonne. It is now included in the departments of Hautes Pyrénées and Gers. The remarkably fertile land, producing grain and the best descriptions of wine, and also favorable for pasturage, is cut up into an extraordinary number of small estates, and divided among numerous petty proprietors. The principal branch of trade is the distillation of the brandy known in commerce as *eau d'Armagnac*, which rivals those of Cognac and Saint-onge. The ancient capital is Lectoure, on the river Gers, with (1872) 2820 inhabitants. To the s. of it lies Auch, the chief t. of the department of Gers. Pop. '72, 9414. The people are noted for their simplicity, strength, and bravery; but on the other hand, they are extremely credulous and ignorant. Formerly, their services were highly valued in times of war. The A. family, descended from the old Merovingian king, Clovis, played an important part in French history.

**ARMAGNAC, BERNARD VII.**, Count d', constable of France, leader of the "Armagnacs" in 1407. He took possession of Paris, and ruled so oppressively that the populace rose, June 12, 1418, and murdered him with all of his faction whom they could reach.

**ARMAGNAC, JEAN V.**, Count d', b. about 1420, grandson of Bernard; a notoriously passionate and wicked man. He publicly married his own sister, who had been engaged to Henry VI. of England. Charles VII. took away his possessions, but they were restored by Louis XI., a service repaid by A. in joining the "league for the public good" against the king. He was driven into Aragon, and his estates forfeited, but the king's brother secured them again for him. He was at last captured by the king's soldiers, who put him to death, and, according to tradition, compelled his wife to drink of some drug that killed her and her unborn child.

**ARMAMENT** is a general name for the weapons of war employed in sea and land battles; all the weapons collectively being called *the A.* of a ship or an army.

**ARMAND, CHARLES, Marquis DE LA ROUARE**, 1756-93; a French soldier, who left France in consequence of fighting a duel about an actress, and volunteered in the American army, receiving the rank of colonel. He fought at Red Bank, also at Camden, under Gates, whose conduct he severely censured. He was at Yorktown, and was made brigadier-general in 1783. Returning to France, he was in the revolution, and was imprisoned in the bastille; but was afterwards a royalist leader in Brittany and Anjou. He d. soon after the execution of Louis XVI., it is said from nervous disease occasioned by the shock of that event.

**ARMANSPERG, JOS. LUDW.**, Count of, formerly president of the government in Greece, was b. in lower Bavaria, 1787, and early embraced an administrative and diplomatic career. On the accession of king Louis to the throne, A., who had already occu-

pied several important posts, was summoned to Munich, where, rapidly rising from one dignity to another, he at length became minister of finance and of foreign affairs. In both capacities he proved active and successful; but he drew upon himself the hatred of the camarilla by his strenuous opposition to the claims of Rome, as well as by his attempts to identify himself with the decidedly liberal party. The consequence was that, in 1831, he lost his post, and in the same year was appointed ambassador to London, but preferred retiring to his family estate. However, he could not resist the king's repeated request that he would undertake the formation of his son's government in Greece, and accordingly, accompanying young king Otho, A. landed at Nauplia in Jan., 1833. For four years he was at the head of public affairs, and Greece derived many benefits from his administration; but the heat of party strife and court intrigues led to his dismissal, and he left Greece in Mar., 1837. After that time he lived in retirement upon his property, near Deggendorf, till his death in 1853.

**ARMATOLES**, a body of Greek militia, first formed under the reign of sultan Selim I. about the beginning of the 16th century. They were intended to preserve the fertile plains from the ravages of the *klephts* (mountain robbers of Thessaly), who had never been entirely conquered by the Turks. The A. themselves were originally klephts, but received their more honorable designation when the porte had metamorphosed them into a sort of military police. The safety of the public roads was intrusted to their care. The whole of northern Greece was divided into sixteen districts (*capitaineries*), each placed under the supervision of a chief of these militia, who, however, had himself to receive orders from a Turkish pasha or Greek bishop. But although the A. frequently suppressed the brigandage of the klephts, they still regarded them in the light of brothers, inasmuch as they had a common origin and faith; both detested the oppressors of their country; and the sentiment of patriotism overruled every other consideration. This sympathy at last appeared to the Turks so dangerous that they grew alarmed, and desired to substitute for the A. the Mohammedan Albanians, who were the implacable enemies of the Greeks, which resolution did not a little to hasten the insurrection which the porte ever dreaded. The moment it broke out, the A. pronounced themselves in favor of the national cause, and in the war of independence that ensued, distinguished themselves by their brilliant exploits.

**ARMATURE** (*armatura*, armor; Ger. *anker*). The term A. is applied to the pieces of soft iron that are placed at the extremities or poles of magnets to preserve their magnetic power. When magnets are allowed to remain any length of time without such appendages, in consequence of the disturbing influence of terrestrial magnetism they lose considerably in strength; but when they are provided with them their magnetism is kept in a state of constant activity, and thereby shielded from this disturbance. The reason of this is found in two facts well known in the science of magnetism—viz., that when a piece of soft iron is brought into contact with the extremity of a magnet, it is itself induced to become magnetic; and that the unlike poles of two different magnets powerfully attract each other. Referring to the figure, the north pole, N, of the horseshoe magnet, NHS, acting on the armature, *an*, induces it to become a magnet, having its south pole, *s*, next to N, and its north pole, *n*, at the opposite extremity. The pole, S, by virtue of its magnetic affinity, powerfully attracts the north pole, *n*, thus formed, and adds its own inducing influence to heighten the magnetic condition previously induced in the armature by the pole N. The A., from the combined action of both poles of the horseshoe magnet, is thus converted into a powerful magnet, with its poles lying in an opposite direction to that of the primary poles. The original magnet is, in consequence, brought into contact with one of its own making, the exact counterpart of itself—a condition highly favorable to the maintenance of its strength. It is due to the same mutual attractions that a much larger weight can be suspended from the A. thus placed, than what the single poles can together sustain. Bar magnets may be armed in the same way by laying them at some distance parallel to each other, with their unlike poles towards the same parts, and then connecting their extremities by two pieces of soft iron. When a magnet, such as a compass-needle, is free to take up the position required by the magnetism of the earth, the earth itself plays the part of an armature.

**ARMED SHIP**, in the official language of the royal navy, occupies a sort of medium position between a merchant-ship and a man-of-war. It is a private vessel, hired occasionally by the admiralty for a special purpose, and commissioned for a temporary period. The duty is usually that of guarding some particular coast, or attending on a particular fleet, during a time of war; and while so employed, it is officered and equipped like one of the smaller ships of war in the royal navy.

**ARMENIA**, a high table-land on the southern slope of the Caucasus, stretching down towards Mesopotamia. It has had different boundaries in the various centuries of its history. It is the original seat of one of the oldest civilized peoples in the world, the Armenians, who belong to the Indo-Germanic family of nations. Their oldest records contain nothing certain beyond the facts that, in ancient times, they were governed by

independent kings, but afterwards became tributary to the Assyrians and Medes. That dim period which wavers between myth and history begins, in the case of A., about the middle of the 6th c. B.C., when king Dikran, or Tigranes I. of the Haig dynasty, restored the independence of the kingdom. The last king of this dynasty was slain in battle against Alexander the great, who conquered the country. After Alexander's death, A. passed through several changes of fortune under the Seleucidae, who appointed governors over it. Of these, two—Artaxias and Zariadres—made themselves independent of their sovereign, Antiochus the great, during the time when he was engaged in his contest with the Romans, 223–190 B.C. They divided the province into two districts—Artaxias taking A. major (that part of the country lying e. of the Euphrates), and Zariadres A. minor (the part to the w. of that river). The dynasty of Artaxias did not reign long; for about the middle of the 2d c. B.C., we find A. major in the possession of a branch of the Parthian Arsacidae, of which the most powerful king was Tigranes the great, who added to the conquests made by his predecessors in lower Asia and the region of the Caucasus, Syria, Cappadocia, and A. minor; defeated the Parthians, and took from them Mesopotamia and other countries. He lost all these territories by his war with the Romans, into which he was led by his father-in-law, Mithridates, king of Pontus, in 63 B.C. After this, the assaults of the Romans from the west, ever growing more and more vigorous, and those of the Parthians from the east, hastened the downfall of A. major. The successors of Tigranes became dependent, partly on the one nation and partly on the other, while internally the nobles broke through the restraints of a feeble monarchy, and claimed the privileges of petty kings. Under Trajan, A. major was for a short time a Roman province. Its subsequent history exhibited an unbroken series of tumults and wars, of violent successions to the throne, despotic reigns, and rapid decay. In 232 A.D., the province was conquered by the Sassanides, who held possession of it 28 years, until Tiridates III., the rightful heir, was restored to the throne by Roman assistance.

It was about this time that Christianity became the religion of A., which was thus the first nation to embrace the new religion. Tiridates himself had been converted by St. Gregory the illuminator as early as about 300 A.D. The old religion of Armenia had for its basis the doctrines of Zoroaster, with a curious intermixture of Greek mythology, and of ideas peculiar to the country. It is certain that the Armenians worshiped, as their mightiest gods, Aramazt and Mihir (the Ormuzd and Mithras of the old Persians); but they had also a kind of Venus, whom they styled Anaitis, and several other deities, to whom they offered animal sacrifices. This change of creed, however, made no improvement in the political circumstances of the falling state. The Byzantine Greeks on one side, and the Persians on the other, regarded A. as their prey; and in 428, Bahram V. of Persia made A. a province of the empire of the Sassanides, and with the deposition of Artasir the dynasty of the Arsacidae was brought to a close. The rule of the Sassanides in A. was marked chiefly by their sanguinary but unsuccessful attempts to extirpate Christianity. In 632, the unhappy country was subjected to another form of despotism under the Arabian caliphs, and suffered terribly during their contest with the Byzantine emperors. In 895 A.D., Aschod I., of an old and powerful Armenian family, ascended the throne, with the permission of the caliphs, and founded the third Armenian dynasty—that of the Bagratidae. Under them A. was prosperous till the 11th c., when divisions and internal strife began to weaken the country; till at length the Greeks, having murdered the last monarch of the Bagratidae, seized a part of the kingdom, while the Turks and Kurds made themselves masters of the rest—only one or two of the native princes maintaining a perilous independence. In 1242, the whole of A. major was conquered by the Mongols, and in 1472 became a Persian province. Afterwards the western part fell into the hands of the Turkish sultan, Selim II.

The fate of A. minor was hardly better. The dynasty founded by Zariadres prevailed to the time of Tigranes the great, sovereign of A. major, who conquered the country about 70 B.C. Afterwards A. minor was subjugated by the Romans, and made a Roman province. On the division of the empire into eastern and western, it became attached to the former, and shared in all its changes of fortune until near the close of the 11th century. At this time A. minor—which had long been a place of refuge for many who had fled from the rage of the Turks and Persians in the sister province—was again raised to independence by Rhupen (a refugee from A. major, and descendant of the Bagratidae). His successors extended their dominion over Cilicia and Cappadocia, and took a prominent part in the crusades. This dynasty ruled prosperously until 1374, when A. minor was conquered by the Egyptian sultan Schaban. Since that time, A., with the exception of the parts which Russia has won in the present century from Persia, and which are better governed, has remained subject to the despotism of the Turks and Persians. Notwithstanding this, the Armenians have steadily preserved their nationality, both in its physical and moral lineaments; their faith; and even—though only a relic of their ancient culture—a higher civilization than their conquerors. The political storms which devastated the country during the middle ages, and the persecutions of the Turks, have driven many of the inhabitants from their homes. This is the reason why we find them scattered over all Asia and Europe. In Hungary, Transylvania, and Galicia they number 10,000. They are very numerous in Russia, but most of all in Asia Minor, and in the neighborhood of Constantinople, where they number 200,000.

The greater part of A. is an elevated table-land. Its area is estimated at 90,000 sq.m.;

pop. about 2,000,000. It is watered by the rivers Kur, Aras, Joruk, Euphrates, and to a slight extent by the Tigris. The lakes which lie within this mountainous region are Van, Urumiyah, and Sevan. The Armenian plateau, on the eastern side of which the volcanic range of Ararat lifts itself, forms the central point of several mountain-chains, such as Taurus and Antitaurus, the mountains of Kurdistan, and those which run n. to the Black sea. It exhibits numerous traces of having been subject to volcanic agency, and even yet—as was shown by the severe earthquake of the summer of 1840, and by the total destruction of Erzerum in 1859—possesses an internal volcanic activity. The climate in the higher regions is hot in summer and cold in winter, but in the valleys it is more temperate. The country labors under a great scarcity of wood, and in some parts is sterile, through a deficiency of water; in other parts the soil is extremely fertile, producing rice, hemp, flax, tobacco, wine, cotton, and many varieties of fruit. Cattle breeding and grazing are more extensive than agriculture. The mountains contain iron, copper, lead, salt, and naphtha. The number of the inhabitants of pure Armenian origin is reckoned at nearly 1,000,000, but there is a large admixture of Turcomans, Greeks, Jews, Kurds, etc. The Armenians belong physically to the finest variety of the Indo-Germanic race. Their intellectual capacity is also remarkable, as is shown both by their literature, and their singular dexterity in business. Still, long centuries of oppression have exerted a withering influence on their native strength of character. The n.e. portion of A., about one third of the whole, was wrested from Persia in 1828, and is under the Russian scepter. About a sixth part to the s.e. still belongs to Persia. The western portion, comprising two thirds of the Armenian area, is Turkish. After the war of 1877-78 between Russia and Turkey, the Berlin conference sanctioned the cession to Russia of a strip of A., including Kars and Ardahan; and the sultan engaged to carry out in A. much-needed reforms, guarantee the Armenians security against the Circassians and Kurds, and undertook to report to the European powers the measures adopted.

**ARMENIAN CHURCH.** Christianity appears to have been introduced into Armenia as early as the 2d century. It was for the first time firmly established, however, about the end of the 3d c. by the apostolical exertions of bishop Gregory (q.v.), who converted Tiridates (see ARMENIA). The Bible was translated into the Armenian language in the 5th century. After this period great animation prevailed in the A. C. Numbers flocked to the colleges at Athens and Constantinople. In the ecclesiastical controversy concerning the twofold nature of Christ, the Armenian Christians held with the Monophysites (q.v.); refused to acknowledge the authority of the council of Chalcedon; and constituted themselves a separate church, which took the title of Gregorian from Gregory himself. For several centuries a spirit of scientific inquiry, especially in theology, manifested itself among them to a far wider extent than in the other eastern churches. Their greatest divine is Nerses of Klah, belonging to the 12th c., whose works have been repeatedly published. The most recent edition was issued in Venice, 1833. The Gregorians have continued to entertain a deeply rooted aversion to the so-called orthodox church. The Roman Catholic popes at various times, especially (1145, 1341, 1440) when the Armenians accepted the help of the west against the Mohammedans, tried to persuade them to recognize the papal supremacy; but for the most part only the nobles consented to do so, while the mass of the people clung to their peculiar opinions, as we see from the complaint of pope Benedict XII., who accuses the A. C. of 117 errors of doctrine. There is a sect of *United Armenians* in Italy, Poland, Galicia, Persia, Russia, and Marseille. Since the formation of this body in 1835, vigorous and constant attempts, succeeded especially by French influence, have been made to secure the acknowledgment of the pope as the head of the Roman Catholic portion of the A. C. When this end seemed nearer attainment than ever before, the Ultramontane utterances of their representatives, Mgr. Hassun, at the ecumenical council at Rome, 1870, in favor of infallibility, created such a reaction at home as has greatly strengthened for the present the cause of the old Gregorian party. The recent humiliation of France has further weakened the cause of the pro-papal party. In theology the A. C. attributes only *one* nature to Christ, and holds that the Spirit proceeds from the Father alone; the latter doctrine, however, being held by it in common with the "orthodox Greek church," although contrary to the theology of the western churches. With respect to the "seven sacraments," it entertains the peculiar notion that at baptism one must be sprinkled three times and as often dipped; that confirmation is to be conjoined with baptism; that the Lord's supper must be celebrated with pure wine and leavened bread; that the latter, before being handed round, must be dipped in the former; and that extreme unction is to be administered to ecclesiastics alone, and that immediately after (and not before) their death. It believes in the worship of saints, but not in purgatory. It exceeds the Greek church in the number of its fasts, but has fewer religious festivals. These, however, are more enthusiastically kept. Divine service is held in Turkey chiefly by night. Mass is celebrated in the old Armenian language; preaching is carried on in the new. Its sacerdotal constitution differs little from the Greek. The head of the church, whose title is *catholikos*, resides at Etshmiadzin, a monastery near Erivan, the capital of Russian Armenia. To this place every Armenian must make a pilgrimage once in his life. The monks of this church follow the rule of St. Basil. The Wartabeds form a peculiar

class of ecclesiastics; they live like monks, but are devoted exclusively to learning. Secular priests must marry once, but none are at liberty to take a second wife.

**ARMENIAN LITERATURE.** Previous to the introduction of Christianity by Gregory (300 A.D.), the Armenians had adhered to the Assyrian or Medo-Persian system of culture; but excepting a few old songs or ballads, no remains of that early period exist. After their conversion to Christianity, the Greek language and its literature soon became favorite objects of study, and many Greek authors were translated into Armenian. (See Wenrich *De Auctorum Græcorum versionibus Arabicis, Armeniacis*, etc. Leipzig, 1842.) The Armenian language has an alphabet of its own, consisting of 36 letters, introduced by Miesrob in 406. The most flourishing period of A. L. extends from the 4th to the 14th century. The numerous Armenian theological writers and chroniclers of this era supply materials for a history of the east during the middle ages which have hitherto been too much neglected. These Armenian writers generally copied the style of the later Greek and Byzantine authors; but in adherence to facts and good taste, they are superior to the general order of oriental historians. In the 14th c., literature began to decline, and few remarkable works were afterwards produced; but since the time of their dispersion, the Armenians have preserved recollections of their national literature; and wherever they are found—in Amsterdam, Lemberg, Leghorn, Venice, Astrakan, Moscow, Constantinople, Smyrna, Ispahan, Madras, or Calcutta—the printing-office is always a feature in their colonies. The most interesting Armenian settlement is that of the Mechitarists (q.v.), on the island of San Lazaro, near Venice.

The Bible translated into Armenian (the Old Testament from the text of the Septuagint) by Miesrob and his scholars (411 A.D.), is esteemed the highest model of classic style. Translations of several Greek authors, made about the same time, have been partly preserved, and contain some writings of which the originals have been lost—namely, the Chronicle of Eusebius; the Discourses of Philo; homilies by St. Chrysostom, Severianus, Basil the Great, and Ephraim Syrus. Several old geographical and historical works have been preserved. Among philosophical and theological writers may be mentioned: David, the translator and commentator of Aristotle, Esnik, and Joannes Ozniensis. The *Vite Sanctorum Calendarii Armeniaci* (Lives of Armenian Saints, 12 vols. Ven. 1814) contains many notices of the history of Armenia. In poetry and fiction, A. L. is poor. Somal, in his work entitled *Quadro della Storia Letteraria di Armenia* (Venice, 1829), gives a general view of the contents of A. L. The Armenian belongs to the Indo-Germanic group of languages, but has many peculiarities of structure. It is harsh and disagreeable to the ear. The old Armenian, the language of literature, is no longer a living tongue; while the new Armenian, split up into four dialects, contains many Turkish words and grammatical constructions.

**ARMENTIÈRES**, a t. of the dep. of Nord, France, on the Lys, 8 m. from Lille. The t. is well built, and is active and prosperous, having manufactures of cotton, linen, and hemp, and a considerable trade in grain. A. was formerly famous for its cloth, cheese, and bricks. Pop. '76, 20,565.

**ARME'RIA.** See THRIFT.

**ARMFELT**, GUSTAF MAURITZ, a celebrated Swede, whose public life was characterized by striking vicissitudes of fortune, was the eldest son of baron Armfelt, and b. at Juva, in the government of Abo, on the 1st of April, 1757. Having, as an officer of the royal guard, displayed great activity and zeal in opposing the machinations of the nobles, who were at that period disaffected towards Gustavus III., the latter appreciated the value of his services, and appointed him to a post in the service of the crown prince. During the war between Sweden and Russia (1788-90), in which he was commander of one of the three divisions of the Swedish army, he displayed remarkable courage and spirit, and advanced still higher in the good graces of the monarch. He defeated a Russian force at Summa, near Fredrikshamm; and as military representative of Gustavus, had the honor of concluding a peace at Verela on the 14th of Aug., 1790. On the 16th of Mar., 1792, Gustavus was assassinated. His wound, though mortal, did not instantly deprive him of life, and he employed the brief interval that elapsed before his death in drawing up a codicil to his will, by which the regency was intrusted to the king's brother, Charles, duke of Sudermania, during the minority of Gustavus IV., A. being named governor of Stockholm, and member of the council appointed to advise with the regent. The duke of Sudermania, however, could not brook the idea of a check being placed upon his liberty of action, and found means to destroy the codicil, the conditions of which he never intended to observe. A. soon became conscious that his influence was rapidly evaporating. He was rarely permitted to see the young king; and at last, after a secret interview with young Gustavus, departed as ambassador to Naples in July, 1792. While in Italy, he entered into correspondence with certain parties in Sweden for the purpose of overthrowing the regency, and inducing the states to proclaim Gustavus IV. of age. The correspondence was discovered. A. fled to Poland, and afterwards to Russia. He was condemned, during his absence, for high treason, and stripped of his goods and titles, while one of his associates, the beautiful countess Rudensköld, was subjected to the most brutal punishment, being publicly declared "infamous," exposed on a scaffold for some hours, and imprisoned in a house of correction for life. A. expressed his horror of such an atrocity in language sufficiently emphatic, yet, at a later period, he did

not scruple to accept office under Charles, on his election to the throne. In 1799. Gustavus IV. received the crown at the age of eighteen, and A. was restored to all his honors. In 1805, he was appointed governor-general of Finland; and in 1808 he commanded the Swedish army raised for the invasion of Norway; but his plans were so completely frustrated, that he was compelled to witness the invasion of Sweden by the successful Norwegians, and was in consequence recalled and dismissed by the king. In the following year a revolution took place, Gustavus was deposed, the duke of Sudermania elected in his place, and A. was appointed president of the military council. But shortly after, being implicated in the poisoning of the prince of Augustenburg, he was obliged to fly to Russia, where he lived during the remainder of his life in high honor. The title of count was conferred on him, he was made chancellor of the university of Abo, president of the board of Finnish affairs, and member of the Russian senate. He d. at Tzarskø Selo on the 19th Aug., 1814.

**ARMIDA**, one of the most prominent female characters in Tasso's *Jerusalem Delivered*. As the poet tells us, when the crusaders arrived at the holy city, Satan held a council to devise some means of disturbing the plans of the Christian warriors, and A., a very beautiful sorceress, was employed to seduce Rinaldo and other crusaders. Rinaldo was conducted by A. to a remote island, where, in her splendid palace, surrounded by delightful gardens and pleasure-grounds, he utterly forgot his vows, and the great object to which he had devoted his life. To liberate him from his voluptuous bondage, two messengers from the Christian army—Carlo and Ubaldo—came to the island, bringing a talisman so powerful that the witchery of A. was destroyed. Rinaldo escaped, but was followed by the sorceress, who, in battle, incited several warriors to attack the hero, and at last herself rushed into the fight. She was defeated by Rinaldo, who then confessed his love to her, persuaded her to become a Christian, and vowed to be her faithful knight. The story of A. has been made the subject of an opera both by Gluck and Rossini.

**ARMIES**, armed forces under regular military organization, employed for purposes of national offense or defense. An army may comprise the whole military men employed by the state, or only a portion under a particular commander. When an armed force is under no constituted authority, and imperfect in its organization and discipline, it cannot be said to be worthy of the name of an army, and may be little better than a horde of banditti. Of this nature are the *filibustering* expeditions (see **FILIBUSTERS**) in which certain portions of the citizens of the United States frequently engage. Through long ages of experience, the principles of military organization, and the laws to which A. are specially amenable, have gradually reached a high degree of perfection. The primitive wars among barbarous people are always stealthy, depending on the forest and the wilderness for their tactics, and considered successful if an enemy can be attacked unawares, despoiled, and carried into slavery. After a time, war advances to the position of an art, and is conducted by men who have received a certain training. An army becomes an instrument not only for vanquishing enemies, but for seizing countries. Even then the highest position of an army is not reached; for the defense of a country requires more military skill, perhaps, and a better organization of troops, than an attack.

In the several historical articles in this **ENCYCLOPÆDIA** relating to the chief nations of ancient and modern times, the wars in which these nations engaged are succinctly noticed as elements in the life of each nation; but it seems desirable, in the present place, as a means of rendering intelligible certain minor details scattered through the work, to give a brief description of the chief points in which the A. of different states or countries have differed in constitution.

**ARMIES, ANCIENT—Egyptians.**—The most extraordinary conqueror among the Egyptians, Sesostris, or Rhamses, lived 16 centuries before the Christian era; and although the evidence for his deeds of valor is very questionable, there is reason to believe that the organization of his A. can be pretty accurately traced. His father, Amenophis, laid the foundation for the military glory of Sesostris. When the latter was born, Amenophis caused all the male children who were born on the same day as his son to be set apart as a special body, to be reared for a military life; they were taught everything that could strengthen their bodies, increase their courage, and develop their skill as combatants and leaders; and were to consider themselves bound as the chosen dependents or companions of the young prince. In due time Sesostris became king of Egypt; and then he formed a sort of militia, distributed as military colonists, each soldier having a portion of land to maintain himself and his family. When this militia had been drilled to military efficiency, Sesostris headed them as an army for military conquest in Asia, and placed the chosen band above mentioned as officers over the different sections of the army.

**Persians.**—In the great days of the Persian empire, the flower of the army consisted of cavalry who were distinguished for their bravery and impetuosity of attack. The infantry were little better than an armed mob. The war-chariots, too, though calculated to strike terror when dashing into hostile ranks, were available only on level ground. As to the numbers of men composing the great Persian A., the statements are too wild to be trustworthy. Allowing for all exaggeration, however, it is certain that the Persian

A. were very large. When Darius was opposed to Alexander the Great, his army was set down at various numbers—from 750,000 to 1,000,000 men. The king was in the center, surrounded by his courtiers and body-guard; the Persians and Susians were on the left; the Syrians and Assyrians on the right. The foot-soldiers, forming the bulk of the army, and armed with pikes, axes, and maces, were formed in deep squares or masses; the horsemen were in the intervals between the squares, and on the right and left flanks; and the chariots and elephants in front.

*Lacedæmonians.*—The Greeks introduced many important changes in A., both in the organization and in the maneuvers. Every man, in the earlier ages of the country at least, was more or less a soldier, inured to a hard life, taught to bear arms, and expected to fight when called upon. The leading men in each state paid attention to organization and tactics in a way never before seen. It was not standing A., but a sort of national militia, that gained Marathon, Plataea, and Mycale. So far as concerned the arrangement of A., the Lacedæmonians invented the *phalanx* (q.v.), a particular mode of grouping foot-soldiers. This phalanx consisted of eight ranks, one behind another; the front and rear ranks being composed of picked men, and the intermediate ranks of less tried soldiers. The number of men in each rank depended on the available resources of the commander. These men were mostly armed with spears, short swords, and shields.

*Athenians.*—The Athenians made a greater number of distinctions than the Lacedæmonians in the different kinds of troops forming their A. They had heavy infantry, constituting the men for the phalanx, and armed with spears, daggers, corselets, and shields; light infantry, employed in skirmishes and in covering the phalanx, and armed with light javelins and shields; a sort of irregular infantry, who, with javelins, bows and arrows, and slings, harassed the enemy in march, and performed other services analogous in some degree to those of sharpshooters in a modern army. It is recorded that Miltiades, the Athenian hero at Marathon, invented the "double-quick march," to increase the momentum of a phalanx when rushing on the enemy.

*Macedonians.*—Philip of Macedon, the father of Alexander the great, having the sagacity to see that he could not vanquish his neighbors so long as he adopted the same formation and tactics as themselves, set about inventing something new. He resolved to have a standing army instead of a militia; to have at command a set of men whose trade was fighting, instead of citizens who were traders and soldiers by turn. As a further change, he made the phalanx deeper and more massive than it had been among the Lacedæmonians. He brought into use the Macedonian pike, a formidable weapon 24 ft. in length. With a phalanx sixteen ranks in depth, four rows of men could present the points of their long pikes protruding in front of the front-rank, forming a bristling array of steel terrible to encounter. Besides these heavy infantry, there were light troops marshaled into smaller bodies for more active maneuvers. Philip organized three kinds of cavalry—heavy, armed with pikes, and defended by cuirasses of iron-mail; light, armed with lances; and irregular.

*Thebans.*—This nation introduced the army-formation of *columns*, much deeper than broad, or having more men in file than in rank. A new kind of tactics was introduced in accordance with this formation; the movement being intended to pierce the enemy's line at some one point, and throw them into confusion.

*Romans.*—These able warriors initiated changes in army matters, which had a widespread influence on the nations of the civilized world. About the period 200 B.C., every Roman, from the age of 17 to 46, was liable to be called upon to serve as a soldier; the younger men were preferred; but all were available up to the middle-time of life. They went through a very severe drilling and discipline, to fit them alike for marching, fighting, camping, working, carrying, and other active duties. Every year the senate decreed the formation of *legions*, or army corps, deputing this duty to the consul or prætor. Magistrates sent up the names of eligible men, and tribunes selected a certain number from this list. See **LEGION**. The Roman legion, in its best days, had many excellent military qualities—great facility of movement; a power of preserving order of battle unimpaired; a quick rallying-power when forced to give way; a readiness to adapt itself to varying circumstances on the field of battle; a formidable impetuosity in attack; and a power of fighting the enemy even while retreating. The heavy infantry were armed with javelins, heavy darts, pikes, and swords; the lighter troops with bows and arrows, slings, and light javelins; while the defensive armor comprised shields, cuirasses, helmets, and greaves.

Those ancient nations which had no distinctive features in their A., need not be noticed here.

**ARMIES, MEDIEVAL.** The downfall of the Roman empire marked the dividing-point between ancient and mediæval times in military matters, as well as in other things that concern the existence of nations. The barbarians and semi-barbarians who attacked on all sides the once mighty but now degenerate empire, gradually gained possession of the vast regions which had composed it. The mode in which these conquests were made gave rise to the *feudal system* (q.v.). What all had aided to acquire by conquest, all demanded to share in proportions more or less equal. Hence arose a division of the conquered territory; lands were held from the chief by feudal tenure, almost in independent sovereignty. When European kingdoms were gradually formed out of the wrecks of

the empire, the military arrangements put on a peculiar form. The king could not maintain a standing army, for his barons or feudal chieftains were jealous of allowing him too much power. He could only strengthen himself by obtaining their aid on certain terms, or by allowing them to weaken themselves in intestine broils, to which they had always much proneness. Each baron had a small army composed of his own militia or retainers, available for battle at short notice. The contests of these small armies, sometimes combined and sometimes isolated, make up the greater part of the wars of the middle ages. Of military tactics or strategy, there was very little; the campaigns were desultory and indecisive; and the battles were gained more by individual valor than by any well-concerted plan.

One great exception to this military feudality was furnished by the *crusades* (q.v.). So far as concerns A., however, in their organization and discipline, these expeditions effected but little. The military forces which went to the Holy Land were little better than armed mobs, upheld by fanaticism, but not at all by science or discipline. Numbers and individual bravery were left to do the work, combination and forethought being disregarded.

A much greater motive-power for change, during the middle ages, was the invention of gunpowder. When men could fight at a greater distance than before, and on a system which brought mechanism to the aid of valor, everything connected with the military art underwent a revolution. Historically, however, this great change was not very apparent until after the period usually denominated the middle ages. The art of making good cannon and hand guns grew up gradually, like other arts; and A. long continued to depend principally on the older weapons—spears, darts, arrows, axes, maces, swords, and daggers.

During the greater part of the 14th and 15th centuries, the chief A. were those maintained by the Spaniards and the Moors on one European battle-ground, by the English and the French on another, and by the several Italian republics on a third. In those A., the cavalry were regarded as the chief arm. The knights and their horses alike were frequently covered with plate or chain armor; and the offensive weapons were lances, swords, daggers, and battle-axes. A kind of light cavalry was sometimes formed of archers on smaller horses. As to army formation, there was still little that could deserve the name; there was no particular order of battle; each knight sought how he could best distinguish himself by personal valor; and to each was usually attached an esquire, abetting him as a second during the contest. Sometimes it even happened that the fate of a battle was allowed to depend on a combat between two knights. No attempt was made, until towards the close of the 15th c., to embody a system of tactics and maneuvers for cavalry; and even that attempt was of the most primitive kind. Nor was it far otherwise with the foot-soldiers; they were gradually becoming acquainted with the use of firearms; but, midway as it were between two systems, they observed neither completely; and the A. in which they served presented very little definite organization.

**ARMIES. MODERN.** The formation of *standing A.* may be said to have introduced the modern military system. When the remarkable exploit of Jeanne d'Arc (Joan of Arc) had enabled Charles VII. to check the victorious progress of the English in France, he set about remodeling his army. By gradual changes, and amid great difficulty, he converted his ill-governed forces into a disciplined standing army. During the reign of his son, Charles VIII. (1483-98), the consequences of this change made their appearance. Charles conducted a well-appointed army into Italy (1494), in support of some pretensions which he had to the throne of Naples.

The change made by Charles VII. was not simply that of substituting a compact standing army for an ill-organized medley of feudal troops and of mercenaries; feudalism itself gave way under the influence of this combined with other reforming agencies. So far as concerned the actual formation and discipline of the standing A. above noticed, a few changes were from time to time introduced: pistols and carbines were given to the cavalry; cuirasses were worn by the heavy troopers; and new evolutions were introduced. During the Thirty Years' war (1618-48), Gustavus Adolphus and Wallenstein adopted opposite modes of dealing with masses of infantry: the former spread them out to a great width, and only six ranks in depth; whereas the latter adopted a narrower front, with a depth of 20 to 30 ranks. Frederick the great, in the next century, introduced a most complicated system of tactics and drilling; insomuch that when he could maneuver, he nearly always won his battles; but when the result depended on bold and unexpected onslaughts, he was more frequently a loser than a winner. The great military leader in the early part of the present century, Napoleon Bonaparte, made a larger use than any previous European general of the method of moving masses of troops with great celerity, beating the enemy in detail before they could combine in one spot.

It is desirable to present, in the most condensed form, a few statistics of the actual A. of Europe; leaving to future articles, under the names of the several countries, cities, and battle-fields, all details concerning special A. and military encounters.

*France.*—A law passed in 1872 enacts that every Frenchman, with a few specified exceptions, is liable to personal service in the army, and forbids substitution. Every Frenchman not declared unfit for military service, or specially exempted therefrom, must be for 5 years in the active army (composed of those who have reached the age of 20

years), for 4 years in the reserve of the active army, for 5 years in the territorial army, and for 6 years in the reserve of the territorial army. By the law of July 24, 1873, France is divided, for military purposes, into 18 regions, each occupied by a corps d'armée, containing 2 divisions of infantry, 1 brigade of cavalry, 1 of artillery, 1 battalion of engineers, 1 squadron of the military train. When the present reorganization is completed, the active army will be composed of 156 regiments of infantry (line, light, Zouaves, Algerian tirailleurs, etc.), 25 single battalions, and 293 companies (depots, etc.); making in all, for the infantry, 279,986 men; of cavalry, 67 regiments in France, 3 in Algiers, 13 depots of these regiments, and a cavalry school, comprising 67,888 men; artillery, 40 regiments and 17 companies, with 58,096 men; engineers, 4 regiments, having 13,551 men; of the military train, 11,486 men; in all, for the active army, 441,007. On the war footing this number would be increased to 1,104,735, without taking account of sanitary corps, gendarmes, etc. Including the territorial army, its reserve force, and the reserves of the active army, the total military force of France is 2,505,000. The budget of 1876 provided for 490,321 men, including gendarmes, etc.
